THE ARCHITECT.

A WEEKLY

ILLUSTRATED JOURNAL

OF

ART,

CIVIL ENGINEERING,

AND

BUILDING.

"Languages become obsolete, but the language of Architecture endures for ever. The pages of history may be lost or destroyed, but who can for a moment admit the thought that time can obliterate, although he may deface her monuments? The pyramids and temples of Egypt are imperishable. The habits, the customs, the religion, the wants, the luxuries of man change with each century and with each clime, but for all and every new necessity and fresh desire Architecture amply provides."—T. L. DONALDSON.

THE
ARCHITECT.
A JOURNAL OF
ART, CIVIL ENGINEERING, AND BUILDING.

THE WEEK.

THE application of Mr. W. ALLAN CARTER to be included among the creditors of the Edinburgh Exhibition Association has been successful. Mr. CARTER claimed the right to a dividend of 13*s.* 4*d.* in 1*l.* on a sum of 631*l.*, the unpaid balance of 1,600*l.* odd for professional services as architect. The liquidator refused to rank Mr. CARTER in terms of his claim, on the ground that he had not completed his work, and that he was bound to go over the claims made by the two contractors against the Exhibition. Mr. CARTER held that he had long ago completed his work to the Exhibition, by making up and sending to them states of the balances due to the contractors. That, however, was quite a different thing from advising the liquidator with regard to claims made against the Exhibition, for which he held he was entitled to remuneration from him if his services were desired. Lord STORMONTH DARLING said that Mr. CARTER had in no way failed in the duty which belonged to him as architect. On the contrary, he had steered very skilfully between the proper discharge of his duty as architect and the saving of his character for impartiality as arbiter if his services in that capacity should be afterwards invoked. Lord STORMONTH DARLING gave judgment in favour of the architect, with costs.

WE are proud of our national monuments, but that is no reason for holding ourselves up as a warning to posterity, or as an example of what is neither to be imitated nor admired. The monumental purposes of St. Paul's Cathedral and Westminster Abbey were not intended to serve the additional purpose of immortalising a generation that did not know its own mind, or of sanctifying the memory of those whom the Duke of ARGYLL would classify as belonging to the genus jelly-fish. Nothing, however, now seems destined to get beyond the stage of talk. The decoration of St. Paul's Cathedral has been accomplished already some half a dozen times in talk or on paper, but the only substantial work in evidence is seen month after month in the shape of scaffolding above the choir, put up for carrying out the ceiling decoration, but on which no workmen ever mount to work. The report of the Royal Commission on Westminster, which has just been issued, does not seem to promise that it will further any practical results. These matters, we must hope, may at any rate be dealt with in the twentieth century, if not in the nineteenth; along with such others as the housing of the Admiralty and War Offices, for instance, and also that of the County Council —if such a body be then in existence.

A PULPIT presented to Norwich Cathedral by the late Dean, Dr. GOULBURN, was inaugurated on Wednesday last week. The pulpit is of Caen stone. The design and all details, sculpture, &c., are by Messrs. R. H. CARPENTER and B. INGELOW, under whose supervision the work has been executed. Mr. CARPENTER made the presentation to the Vice-Dean on behalf of Dr. GOULBURN, who was unable to be present, and the Vice-Dean, in accepting the gift, referred briefly to the important works effected by Dr. GOULBURN at Norwich. Reviewing them, he had been perfectly amazed at the work done by the late Dean, either by his own inspiration, or by his own friends and mainly at his own cost. A cathedral had a wonderful facility for absorbing money, and the least work done was more costly than many could possibly conceive. Years ago the roof was covered with a thick yellow wash, which blotted out the ancient colouring and concealed the beauty and delicacy of the structure. That was removed at the cost of the late Dean. It was a work involving a great deal of mechanical difficulty. He also drew out with great care an elaborate and finely-illustrated work describing the bosses upon the roof, so that it was a revelation to most persons of the great beauty of the sculptures adorning them. The Reliquary Chapel was restored by him, and also the Jesus Chapel. When Dr. GOULBURN came to Norwich that chapel was in great disrepair, and he wished to show by its restoration what it was like in its earlier days. Dr. GOULBURN at his own expense laid bare in the gardens the foundations of the Norman lady chapel, and the Chapter hoped that it would be put into the heart of some one to finish the work so as to make again complete the original design. At one time the parishioners of the old parish of St. Mary in the Marsh met for worship in the chapel in the Palace grounds built by Bishop REYNOLDS, an arrangement which caused some inconvenience, whereupon Dean GOULBURN, at his own cost, liberally restored St. Luke's Chapel for their use. Another great work done by the late Dean was the restoration of the whole of the apse, with all its circumstantial details, when decayed work had to be replaced by substantial masonry. Among smaller works done by Dr. GOULBURN were the turret-stairs in the cloisters, the restoration of the vestries over the cloisters, repairs to the Erpingham Gate, providing choristers' desks and establishing the present vestry.

A STRANGE engineering feat is recorded to have taken place in San Diego County, in the extreme south of California. The work has been accomplished by nature and not by human agency. The correspondent of the *Standard*, telegraphing from New York, says:—"The phenomenon consists in the almost sudden formation of an inland sea. On Saturday a trickling of water was observed to damp the ground around the Salton Salt Works, and now it has expanded into a lake ten miles square and from 3 feet to 8 feet deep. Then at Indian Wells, sixty miles south of Salton, another new sea, forty miles square and from 3 feet to 5 feet deep, has been formed. It appears possible that these bodies of water may unite, and form a lake fifty miles long and 400 feet deep." The water is supposed to be derived from the Colorado river, and the correspondent adds:—"The so-called Colorado Desert, lying to the east of the new lake, resembles the bed of a dead sea. It has an area of three thousand miles, and lies 270 feet below the ocean level. Shells and other marine deposits abound. Engineers have often planned to make this area fertile by irrigation, after the manner of the Valley of the Nile, which would add two million acres to the State, but all their efforts so far have been in vain." It may be that some outlet has taken place in the marshy district, extending for some miles in the neighbourhood of Arizona city.

STUDIES OF SOME CHURCHES IN THE PROVINCES.—III.

[By a Correspondent.]

THE parish church of Buckland St. Mary, Somerset, is about five miles from Chard, and charmingly situated on the Blackdown range of hills. It was rebuilt to a new design by an eminent architect (now gone to his rest), on the site of an older church, about thirty-five years since. Everything was then done in the handsomest and most substantial manner, without stint. The walls are thick, the interior lined with ashlar stone, and all the windows (except two, which at the time of the writer's visit had diapered quarries) filled with painted glass containing figure-subjects. Though a small matter, it is worth mentioning that outside the south porch is a long iron scraper—long enough to accommodate no less than three people scraping their boots at the same time—and with a rail at a convenient height to serve as a stay. That rail is a capital thought, for it is awkward for a man to have one leg up and then perhaps be nearly set off his balance by someone entering the church accidentally pushing up against him. In the country, where many of the parishioners have to walk in winter some distance through muddy roads, a well-contrived scraper helps to keep the church clean and nice. There is not only a south porch but also a tower at the south-west angle of the nave, which forms another porch, having a west doorway and also an archway in its north wall leading into the church. It is groined in stone. Opposite the archway is a wide unencumbered space, where stands a handsome font raised on a platform, and with a lofty oak pyramidal canopy. The whole area of the nave and aisles is paved with tiles, except where there are fixed seats, which occur next the walls to the north and south aisles. And there are a few in the western part of the nave, where the aisles do not extend. These are light, skeleton-framed open oak benches, not fixed. The central passage is very broad, and wider still is the cross passage opposite the south porch. This roominess constitutes an enormous advantage to the interior of any church, giving it an appearance of great space. One notices it the more because of its rarity, for in too many churches the seats look as if they have been crammed, rammed and jammed into it! This beautiful building was erected at the expense of the late rector, the Rev. Edward Lance, to the memory of his wife, whose cenotaph, recessed in the north wall of the chancel, was exquisitely sculptured by Mr. Forsyth. Under a segmental pointed and moulded arch is the figure of the mother, on a low pedestal, holding a babe in her arms, with the lid of the tomb breaking, clearly representing the Last Resurrection, and showing that the two departed this life together—a pathetic story well told in stone. To the south of the chancel, nearly at the east end, are the lowly tombs, side by side, of the founder of the church and of his wife—only a Latin cross of marble and a curb of the same material round the grave, that is all. The doors of the church are always on the latch during the day. There is daily service at a quarter to nine o'clock in the morning, and the building is warmed during the winter daily, not on Sundays only. Would that such an excellent example was more frequently followed! though it must be admitted that in many parishes it would be impracticable on account of the cost.

On what was practically the first day of spring, about the middle of April, the bright sunshine and gentle west wind tempted the writer a little out of town for a half-holiday. It was not very far off, it is true—only to Croydon, which in another ten years will almost become a suburb of the great metropolis. For a considerable period he had cherished the idea of examining the noble church of St. Michael and All Angels in this ancient town, which, though modern, is the design of Mr. Pearson. The building stands well, on rising ground at the fork of two roads, and is therefore a prominent object from the lower part of the town. Though it possesses no tower or spire, it has a lofty *flèche*, covered with lead, placed over the "crossing," and also has those large square turrets at the east sides of the transept which are so characteristic of this master and so well treated by him. Most architects would elect for octagonal or circular turrets, which are easier to treat than those of square plan. Where the funds at the disposal of the architect are not stinted, and there is a substantial reason for such turrets, they become a very telling feature in ecclesiastical architecture. This church is of rather severe thirteenth-century character, stamped with that originality possessed by a modest few architects, whose work in the ages to come can never be mistaken by the competent student for that of the Middle Ages, though the bricks, the stone, the woodwork, the metalwork, &c., are instinct with the true Mediæval spirit—that spirit which scorns the commonplace, refuses to tamely copy, yet at the same time declines to wildly wander away into pathless fields where there is no light or guidance. The main material employed at St. Michael and All Angels is red brick, freestone being sparingly used; the windows are lancets of considerable length. The great height of the church, the lofty proportions of the clerestory and the unusually bold projection of the transepts all tend to produce a striking effect, notwithstanding the plainness, which plainness is enhanced by some "annexes" of the church being still incomplete. This really seems one of the most successful of Mr. Pearson's buildings, with its quietude, its sense of restrained striving against sensational effect, its harmony of proportion combined with great delicacy and refinement in the details. It need scarcely be said that the whole character of the work is thoroughly English, not foreign, though in its great height and in being vaulted throughout the designer may be said to have taken a leaf out of the Continental book. The minute serration in the ridge tiles is vastly superior to the more common up-and-down, fussy manner in which they are often tortured in shape. The aisle buttresses have only one long water-table, executed in brick, which is a more effective treatment than a series of lesser set-offs at different levels. The doors of the church are, of course, open, and the traveller on entering is surprised to find the building vaulted throughout, a rare occurrence in an English parish church, whether ancient or modern. The groining is in stock bricks with stone ribs. There is really nothing externally to tell the tale, no flying buttresses or apparent preparation, so very much in evidence in French examples. But the walls are massive, and the flying buttresses must be over the aisle vaulting, though, of course, rather low in position for their work. There is a west gallery, forming a structural part of the church, and carried on vaulting. The restraint of the architect is felt in such details as the extremely simple gratings to the channels of the hot-water pipes in the passages and in the very plain square red tile pavements without pattern. The processional path or ambulatory to the semicircular apse gives great effect to the interior. It also shows how very necessary it is for an apse to be vaulted, a wood ceiling or an open-timbered roof being nothing more than a modern incongruity. There is an effective, though most unobtrusive, little ornament, which is a favourite of Mr. Pearson—a small pearl introduced on the soffit of the bell of the moulded capitals to the nave arcade, in the same capitals where the dog-tooth is also used. There is another clever contrivance by which the architect gets over what often forms an awkwardness in circular capitals, so much so that the writer has known an eminent architect who preferred the square abacus, entirely for that reason. This is a little trefoil which bridges over the abacus where otherwise it would have been crushed by the projection of the square of the wall above. The manner in which the artificial lighting of the church is effected is to be commended. There are a double row of pendants to the nave, and the seven pendant oil lamps to the sanctuary are not set as usual, *i.e.* alternately up and down, but all to an arched imaginary line, the rise in the centre being inconsiderable.

At Chorley Wood, a little beyond Rickmansworth on the Metropolitan Railway Extension line, is a charmingly situated church, by Street, on the edge of a breezy common. From the appearance of the building, it seems to have been erected somewhat over a quarter of a century. Though the writer has examined the interior, which is obviously the most important part of a church, his remarks will be devoted to the exterior, for the simple reason that he has more to say about that on this occasion, pleasing as architecturally the structure is internally. The same remark about the buttresses can be made as at St. Michael and All Angels, Croydon, *i.e.* the good effect of the

long slopes of the water-tables, there being only two gradations, though each is much subdivided, with very delicate drips, the materials used in the building being flintwork and freestone, and not bricks, as in the previously mentioned example. There can be no more unmistakable sign of the hand of the well-informed architect than the proportion and general treatment of the set-offs to the buttresses, a simple matter as some might think. There is a curious feature, for a modern church, in the manner in which the vestry, on the north side, is attached to the chancel. There is not sufficient space for the stone weather-mould of the roof to quite clear the jambs of the nave window, and so a special contrivance has been devised to get over this, and the outer order is therefore stopped on each side of the vestry. If the latter had been built at a subsequent date to the rest of the church it could have been understood; but that apparently not being so, one wonders why the architect could not have shifted the nave windows two or three inches, about which there would seem to have been no difficulty. The simple serrated ridge tiles to the roofs of the nave and chancel, with more than ordinarily deep "wings," are quite in the manner of Street. This is a point of great importance, especially in a plain, simple church, for the deep wing, though costing little more than a shallow one, well repays the extra expense by its superior and handsome aspect. The flints are not squared, but are in small, irregular-shaped sizes, with the natural face everywhere knocked off. There are no stone bonding-courses externally, though there are a fair number of stone strings. One point in the arrangement of the step to the principal or north entrance is that it is brought forward into the porch about 18 inches. This is worth attention, for it not only has a good appearance, but also helps to prevent accidents. There are no summerstones anywhere to the gables, which necessarily makes the feet of the rafters more prominent in this situation than in most churches. At the same time this is far better than the enormously projecting "knee-stones" which are to be often seen, constituting a vain attempt to mask what there is no need to conceal. The writer in his own practice has been always particular to employ summerstones of slight projection, without endeavouring to entirely hide the overhanging eaves, the ends of which require but little attention to make them look "ship-shape." A tower stands at the west end of the nave, which has a spire covered with oak shingle, having a picturesque arrangement of spire-lights, with louvre-boards at its base, which tends to make the transition between the tower and the timber spire less abrupt than it often is. That is a point worth attention, so as to prevent the appearance of a harsh junction line suggestive of an "extinguisher." It ought not to be possible to allow the scoffer of architects to have an excuse for such observations which, recklessly as they are often made, sometimes contain more than a germ of the truth.

VILLAGE BUILDINGS.*

FEW spots in the country are now left unexplored. In the old coaching days persons knew something of the beauties of the land, but in these days, when cycles have come to the fore, people are familiar with the by-lanes as well as the highways. A book such as the one produced by Mr. Williams should find a place in every house in the kingdom, for it puts into adequate language what is felt by the majority as they scour the country. It would be just as cheap, they say, "to build something pretty instead of those glorified doll's houses." We will, however, let Mr. Williams speak for himself. He says:—

A thousand towns are breaking through their old boundaries, and a great army of so-called builders, like a swarm of locusts, is on the march devouring every green thing within its reach. The adjacent hills are being slowly covered with all manner of "Institutions, perched in ghastly affectation of architectural pomp," utterly ruining the outlook from every point of view. Nearly every large town has its Crystal Palace (the name is enough) or folly of some kind. There is no doubt that the Exhibition of '51, as a building, has exercised a most pernicious effect upon the general taste, by creating an unwholesome and vulgar desire for glass and glass houses, as seen everywhere in the modern shop-front and house.

Our villages, except in a few manufacturing and mining districts, although unaffected by some of the causes which are working these rapid transformations in the towns, are nevertheless subject to other influences that are gradually and surely changing their old character. Houses which naturally fall into decay are seldom replaced or repaired upon the old lines. The building of the cottage as our forefathers knew and practised it (the making of a simple, pleasant, and healthy dwelling, with sufficient accommodation for the requirements of the tenant, and in harmony with the natural surroundings), is in danger of becoming a lost art. Rarely do we see the reproduction in any form of an old cottage; and yet there are scattered over the country numerous really good examples, entirely convenient in arrangement, and beautiful in their simplicity and picturesqueness. Instinct with a right and natural treatment, these show how the most pleasing effects may be obtained without the sacrifice of comfort or convenience, and with no wasteful or unnecessary expenditure of labour or material. The builders drew upon that invaluable experience which in past ages men gathered not from books, but from long years of patient observation and varied work. Compelled in many cases to make the best of local materials, they became adepts at readily distinguishing between that which was good or bad, and of selecting that which was most suitable for each particular purpose. They made no slavish attempts at uniformity or machine-like accuracy, their chief aim being soundness of construction. Their brick or stonework may not always keep a rigid line, or the timbers display a surface of perfect smoothness; but the former are bonded with honest mortar, and the latter carefully chosen and securely framed together. The lack of absolute regularity and surface finish is more than compensated for by the honesty of construction and the cunning way in which unforeseen difficulties were met and overcome.

Chiddingstone, in Kent, is a charming and rare instance of an old English village, with its half-timbered houses and shops. Almost every county had its own special and peculiar treatment of its buildings, and to travellers through the country this is clearly visible.

In Surrey the old cottages are mostly built of timber framing to the upper part, with brick or stonework below. The framing was generally filled in with laths or wattle (a kind of hurdle) secured to the framing (and called by the old country builders wattle and dab), and plastered over between the timbers. There are a great many cottages built almost entirely of timber framing, with merely a low brick or stone plinth, in order to keep the timberwork clear of the ground, and it is astonishing, with ordinary care, how many generations, almost centuries, such buildings will last. Here, as in parts of Kent, Sussex and Hampshire, weather-tiling was often used on the upright outer wall-framing, as providing, no doubt, better protection against rough weather. These hanging tiles, as they are called, were made in various patterns, and mostly hung on the upper half of the wall, being the most exposed part. The colour was a bright red, and different to that of the roof-tiles. Who can ever forget the lovely drawings by that gifted artist, Mrs. Allingham, of these cottages with their little flower-gardens, redundant one had almost said, redolent with those old-fashioned and sweet-scented flowers—pictures full of beauty?

In Hertfordshire the cottages and farm buildings are often wholly built of timber-framing and tarred weather-boarding, with a plinth of brick or stone, and when the golden moss comes upon the red-tiled roof, the effect is most pleasing. In some instances, where cream-colour paint is used, an equally satisfactory effect is obtained in combination with tiles.

In Sussex the lower half was generally built of stone, and the upper half of timber-work, the roof being covered with local stone tiles or slabs, giving a most picturesque appearance, and when properly applied perfectly weather-proof. Of course this kind of roofing requires stronger timbers than slates or tiles, but the old builders generally put timbers strong enough to carry anything. The comparison between the old and new in this respect is very great, the modern roof-timbers, especially those to receive slates, looking at a distance more like matches. In some parts of Sussex, too, a good deal of black weather-boarding may be seen, used, no doubt, in districts where stone or bricks were much more expensive than timber.

In Devonshire and some of the adjacent counties the cottages are often built of what is called cobb (a special kind of earth and straw) brought to an even face, coloured mostly cream colour, and covered with red tiles, stone slates, or often with thatch. The somewhat irregular surface, and the absence of sharp angles, together with their lovely surroundings, are very charming, and it is said such houses are the coolest in summer and the warmest in winter. The stone cottages in some of the seaside places, like Clovelly, are very interesting from the way in which they seem to have been built, nestling as it were, upon the ledges of rock, one above the other, in the most irregular but picturesque manner. No doubt one by one the first cottages were naturally enough erected after a careful selection of the easiest place to build upon. These cottages

* *Sketches of Village Buildings*, from Designs by James Williams, Architect, with Notes. Richard Bentley & Son, London.

mostly settled the position of the subsequent village or town, and those following had to make the best of the remaining sites. If it could have been foreseen what large villages or towns would have arisen, possibly very different positions would have in many cases been chosen. It is well for the picturesqueness of our towns that this foreknowledge was impossible.

The construction and arrangement of every building, however simple, should be influenced by its site and surroundings. The site is a most important point, both as to aspect, convenience and picturesqueness ; and this, together with the use of the simple and natural building materials of the locality, have a good deal to do with the charming effect so often seen in connection with old buildings. In days of agricultural and general depression, the question often arises, how to build dwellings for the labouring classes so as to get any reasonable kind of interest for the outlay. Most people give it up as hopeless from that point of view ; but if a well-considered plan be adopted with the simplest and most economical construction (consistent always with solid work), a sufficient return ought to be made except in unusually expensive districts. This, too, should provide for a large living-room, a scullery, three bedrooms, and the necessary adjuncts, so that all may live in comfort and decency. In most cases where the building of cottages does not "pay," it is from want of proper management. In some instances, where such works are carried out by the "Estate," they can be done as well and at less cost by an outside contract.

Too often, with small and inexpensive buildings, the general appearance and effect are disregarded, and a site chosen where it is vainly supposed little will be seen. The result being a conspicuous and ugly object, entailing as much or more cost in planting out than would have been incurred in making a suitable place in the first instance. There is no building, however simple, but should be made presentable from every point of view, and this too without any kind of unnecessary ornament or cost. The use of ornament, for its own sake, rarely seems desirable, especially in cottage buildings. In such buildings internal comfort and convenience are often sacrificed to external show. The chief points to be considered are a suitable site, a well-arranged plan, and, above all, sound and plain work, carried out with the best available local labour and materials. Such were the little homesteads which a long-forgotten generation of craftsmen built up from the ground, slowly it may be, but soundly and well, as could only be done by honest men working with heart, head and hand.

Penshurst is a pleasing instance of a small village with its church close to the castle, picturesquely situated in an undulating country. There are a few old cottages remaining, and most of the interesting ones, and the features of the village, are comparatively new, but so charming in the general effect, and in the appearance of age, that they are often mistaken for old buildings. The proximity of the cottages to the church and castle, the quaint covered entrance through into the churchyard, the beautiful lodge and archway leading to the castle, all well backed with fine trees, the winding road down to the new but old-fashioned looking bridge, which crosses the stream, all combine to make a lovely piece of quiet landscape rarely to be met with now. Most of the works connected with the careful restoration of the castle and the new buildings generally were carried out for the present noble owner under the superintendence of the late Mr. George Devey, the accomplished architect and artist. No man ever more thoroughly appreciated and understood the essential characteristics of village buildings.

As another example of some particularly good cottages, those on the St. Alban's Court estate, near Canterbury, may be mentioned, whose owner is himself a gifted artist in every sense. These were mostly built many years ago, and where the grey and golden lichen has kindly grown on roof and walls, with their simple but pleasing outline, the effect is unusually satisfactory and picturesque. Such buildings are rarely to be met with in modern work, and to those interested in these matters they are well worth seeing. These, too, were erected from the designs of the late Mr. George Devey. They are built with a combination of red bricks and Kentish rag stone for the lower part, the latter dying off irregularly into the brickwork, as may be seen in many old examples. The various sizes and the proportions being carefully thought out, the larger stones at the bottom of the relative size, about twice in length to the height. These and many features of old work have been followed. Most of the buildings are now well covered with ivy, roses and creepers, and the result is in every way charming. How very different the feeling produced by most new buildings and model villages with their monotonous regularity, uniformity and general barrenness.

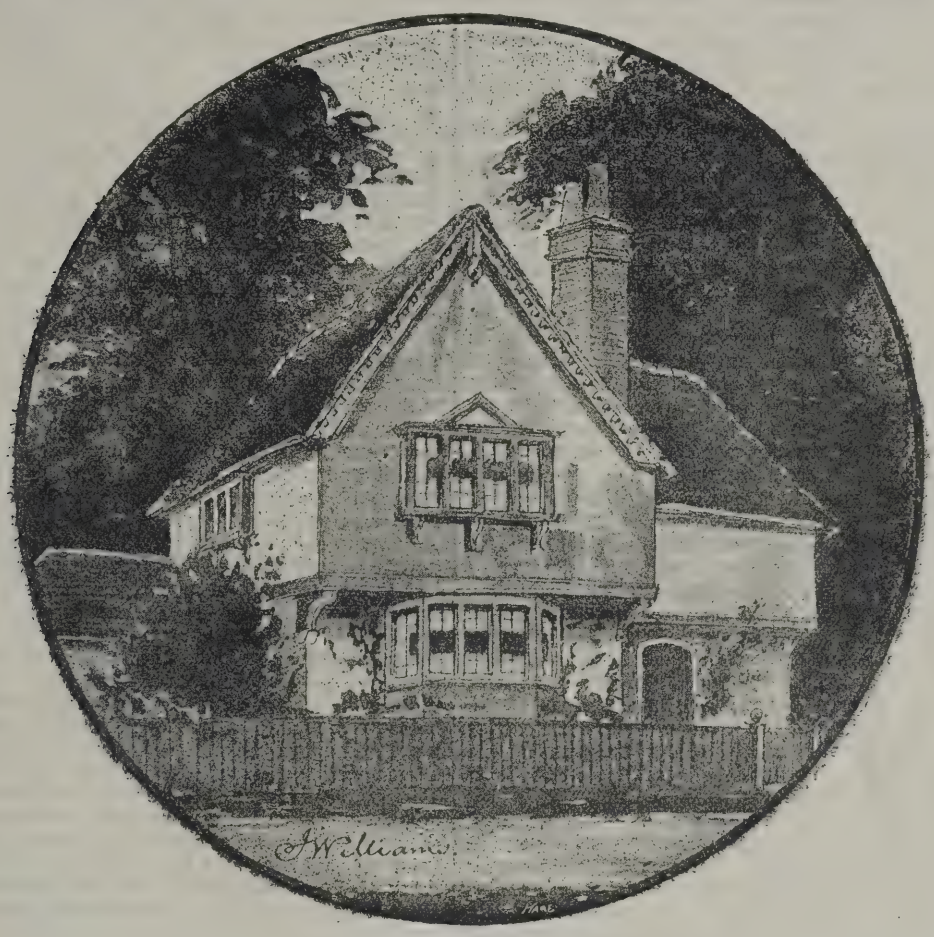
Village Club and Cottage attached.

To those who live in towns and long for a country life it forms a constant and ever-recurring diversion to picture a combination of lovely features collected by the memory and expanded by the imagination. The winding road, with ample turf on either side, the tall elms and shady walks in summer time, the distant spire amongst the trees, the straggling cottages, some by the roadside, some standing back with gardens full of flowers, and here and there a well-clipt yew. The village inn, with hanging sign and drinking-trough, and ample bays commanding the wide road, the covered archway leading to the stable yard, once merry with the sound of London coach. The old-fashioned inn, with all its faults, has always been an attractive and interesting place, particularly if it chanced to be on a main coaching road. It was, in fact, in coaching days like the hotel and railway station combined, and a welcome place indeed to weary travellers, busy and cheerful, with old and new faces constantly coming and going. There is no reason why, under proper regulations and restrictions, it should not still be a harmless, useful and pleasant place, minis-

tering to the real wants of travellers, with thorough cleanliness, instead of being merely a drinking-shop. The various little shops, the blacksmith's forge and village green, the school, the park and squire's house among the trees, are all features of an English village ; to which, perhaps, might now be added, with advantage to the village green, a level place for games, strong sheltered seats, outdoor gymnasium and swings, a simple covered shelter from the sun and rain, with clock and weather-cock, a fountain or a well, a walk all round, with avenue of trees (chestnuts and planes).

The pavement in the village streets of brick, well up above the road, planted with trees. A sure and constant pure water supply to each house, with a thorough drainage and sanitary system, free baths and laundry and washhouse attached. A separate school for boys and girls, with kitchen and workshops, where some simple trade or useful work could be taught, best suited to each child. A library and reading-room, and other requirements always suggesting themselves in course of time, to meet the needs and administer to the happiness and welfare of the people.

It will be a sorry day for England when the peaceful rural character of her churches and villages gives place to the urban character with all its attendant sweeping alterations and so-called improvements.



The extract we have made will be more than enough to show the character of the "Notes," which are of a most interesting character throughout, to the general public. But there is also a vast amount of information for students of architecture, information which it is well that the public should con over, seeing how great is the influence, however indirect it may be, that the owners of the smallest amount of property even may exercise on behalf of adding to or destroying beauty. All will agree with Mr. Williams that "Simplicity in both design and construction is the chief thing to be desired. Externally the real attraction and merit of all cottage building consists in the simple picturesque disposition of its parts, and internally in their convenient and economical arrangement. In old cottages the former seems to have been done in the most natural way without any kind of effort, almost as though the buildings had grown up like the trees and hedges about them—so completely suitable and fitted in every way do they appear, although often no inconsiderable part of their charm is due to the effect time brings." We reproduce two of the sketches, which number over thirty, though it is not possible to produce the warm rich tones of the brown sepia-like sketches, which have been faithfully reproduced by Messrs. Sprague & Co. The little work is an ornament to any table and of the sketch-book form. The whole of the letter-press has been printed in the same tint as the sketches. At any rate the book may as well find a place in private homes as in the office of the architect and the builder.

THE ROMAN WALL.

IN recommending the old Roman Wall as worthy of a visit during the holiday time, the *Scotsman* mentions Gilsland as the best centre of departure for short expeditions.

There have been various theories as to the builder or builders of the wall, but the testimony of the best authorities would point to the whole line of fortifications (including the wall with its northern fosse and southern vallum or earth-wall) having been constructed by Hadrian, and later repaired by Severus. In doing this, Hadrian evidently abandoned the earlier and more northern line of defence drawn by Agricola between the Firths of Forth and Clyde, in favour of this more southern rampart. As Appian tersely remarks, "The Romans have not cared to subdue the rest of Britain, the part which they hold being already almost useless to them." Indeed, when we look on the ruins of this massive structure and realise the labour of building it, and the necessary organisation required in keeping it defended, we are filled with wonder at the energy and greatness of the race who expended so much thought and work on the defence of one of the poorest and most outlying of their provinces. From the fact that every station and every mile-castle along the course of the wall has a gate opening to the north, the line of fortifications was clearly raised by the Romans with a view to protecting themselves against invasion from the Caledonians. The southern earth vallum would serve the double purpose of a second line of defence, and would also be a barricade against the attacks of the conquered but scarcely friendly British tribes. The ground enclosed between the two lines of fortification would serve as grazing ground for the cattle, of which there must have been considerable herds to supply the commissariat of so large an army.

Along the wall itself were the structures provided for the accommodation of the soldiers. These consisted of (*a*) stations, (*b*) mile-castles, (*c*) turrets. The stations or camps were situated at a distance of four miles from each other, and covered about five acres of ground. Several of them are in such good preservation that their construction is easily traceable without any great archæological skill. The ground plan lies before us—a

KEEPER'S LODGE.

book that he who runs may read. There are almost always four gateways—north, south, east and west. The wall is usually incorporated with the north wall of the camp, while the vallum comes up to its southern wall. Traces of the main streets, which led from the different gates and crossed each other at right angles, can still be distinctly traced. Remains of suburbs and villas outside the camp have also been discovered, and suggest the theory that the chief officer in command had his quarters outside the fortifications in times of peace. The three largest and best-preserved stations are Chesters, the ancient Cilurnum ; Birdoswald, the ancient Amboglanna ; and Housesteads, the ancient Borcovicus. These camps are all within easy distance of Gilsland. The identification of these stations, in whose modern homely names no trace of their ancient high-sounding Latinity survives, has been possible by the Notitia, a record of the Roman days equivalent to our modern Army List. In the Notitia each camp along the line of wall is named, with its corresponding number of soldiers and the legions to which they belonged. Thus, when we find that at Cilurnum the garrison belonged to the Asturian tribe, and when at Chesters alone among the camps we find inscriptions to Asturian soldiers, the inference is obvious. So with the other camps, which were occupied by Batavians, Dacians and others.

A brief description of Chesters will serve as a type of the other camps (twenty-three in number), most of which are now level with the ground and serve as pasture-land for sheep. At Chesters, thanks to the careful excavations of Mr. Clayton, owner of the property, the ancient masonry is considerably above the level for the ground, and the plan of the Roman camp, with its gateways and guard-chambers, its prætorium, its forum, with narrow streets, and its broader streets intersecting it in the middle and leading to the gateways, lies like an open scroll before us. The remains of the gate are quite high, and are in excellent preservation. Each gateway has two portals, about eleven feet wide, separated by a wall, on either side of which is a guard-chamber. The portal was closed by a massive two-traved gate, the hole in the masonry on which the pivot turned being still distinctly traceable. Other buildings, of which the foundations are well preserved, were presumably used as granaries and store-chambers. The forum has been identified from its structural similarity with the forum at Pompeii. Below the soil many fragments of pottery and Samian glass, coins and ornaments have been found ; also bones of animals and shells of mussels, oysters and limpets, a species of food to which the Romans were much addicted. There is much else of interest at Chesters outside the limits of the camp, notably the foundations of a great Roman bridge, and a large and lofty group of buildings, recently excavated, including, amongst others, the well-preserved remains of Roman baths. So much for the camps. The mile-castles were, as their name denotes, placed along the wall, at the distance of a mile from each other between the camps. They are massive, quadrangular buildings let into the wall, 60 feet by 50, with gateways to the north and south. Some of them are in a very good state of preservation, more especially one in the neighbourhood of Housesteads. Between the mile-castles were three small turrets or sentry-boxes, of which the remains are less easily traced. The wall itself is in no place entirely perfect, but from the evidence of the best authorities it must, when it was constructed, have been eighteen feet high by eight feet broad. Now it rarely reaches an elevation of over five feet, and in breadth it averages from three to five feet. At some places it disappears entirely, at others it appears in a very fragmentary state.

TESSERÆ.

The Vitruvian Architect.

ARCHITECTURE has been defined as the art of building ; but this art can only rank among those called the liberal arts, when it is practised according to principles taken from nature, and when it follows the rules which relate to those wants and gratifications of our eyes and of our minds which require to be satisfied by the architect. The etymology of this word sufficiently shows that, in Greece, the artist to whom it was given was, in fact, the supreme director of the labours and works which are combined in the formation of an edifice. Therefore, the superior nature of this office leads us to suppose that he who filled it possessed a rare combination of talents and general knowledge. The number of qualifications which Vitruvius exacts from an architect conveys to us the highest idea of the powers which the ancients recognised, both in the art and in its professors. "In this art," says the Roman architect, whose theory we shall greatly abridge, "as in everything else, we distinguish what is signified from what signifies. The thing signified is that of which we treat, and that which signifies is the description of it, set forth by reason, and supported by science. Thus, in architecture we separate practice from theory. The first is executed by the hands, which give to the material, whatever it may be, its proper form. The second demonstrates ; it explains works executed by the aid of judgment and by the rules of proportion. Thence it results that architects without theory, assisted by practice only, and limiting themselves to the executive department, have never been able to acquire any name by their works. The same thing has likewise happened to those who, confining themselves to theoretic knowledge, have failed in their object by pursuing its shadow. The reason why it is necessary that the architect should be equally acquainted with practice and theory is that his imaginative and executive powers should alike be cultivated; for genius without perseverance, or perseverance without genius, can never form a perfect artist. The architect ought, therefore, to be able to write and draw, to have studied geometry, and not to be ignorant of arithmetic ; he should know history, be skilled in philosophy, and have some acquaintance with music, besides a smattering of medicine, jurisprudence and astronomy." Pythius, one of the most celebrated architects of antiquity, who distinguished himself by the construction of the temple of Minerva at Priene, exacted from architects (as he expresses himself in a treatise he composed) a still more profound knowledge of each particular science than would be exercised by the professors of the sciences themselves. Vitruvius is more judicious, for he only requires a moderate knowledge of the different branches of science. He says, "It is neither possible nor necessary that the architect should be as good a grammarian as Aristarchus, as great a musician as Aristoxenes, as excellent a painter as Apelles, as skilful a sculptor as Myron or Polycletus, or as learned a physician as Hippocrates. It is enough," adds he, "that he should not be ignorant of grammar, music, sculpture and medicine ; the mind of any one man not being capable of attaining perfection in such varied and eminent acquirements." To these particular or general studies, Vitruvius desires the architect to unite much perseverance and disinterestedness. "I know well," he continues, "that a great part of the world hold the opinion that the chief end of wisdom is to render us capable of amassing great riches, and that there have been few men found who have been fortunate enough to acquire wealth and reputation together, since, for the most part, their principal care is to seek for great employments. As for me, I have learned from my masters that an architect ought to wait until he is solicited to undertake the conduct of a work, and that he cannot without shame make a request that would cause him to be regarded as an interested man. We know that we do not importune people to do them good, but to receive good from them. What would a person think who was asked to permit his goods to be laid out to a great extent, except that he who required such a favour of him hoped to make some great profit to his detriment? This is the reason why people formerly, before employing an architect, made inquiries respecting his birth and education, and they trusted more to those who appeared diffident than to those who affected great capability. The custom likewise of those times was for architects to instruct only their own children or relations, or at least only those whom they judged capable of acquiring learning to the extent required from an architect, and for whose fidelity they could answer." After this enumeration of the attainments which were considered necessary for the practice of architecture among the ancients, we ought not to wonder that Plato asserted "that a good architect was a rarity in Greece."

Velasquez as a Court Official.

Upon the return of Velasquez from an artistic mission in Italy in 1651, the King, as an especial mark of favour, conferred upon him the office of aposentador mayor, or quartermaster-general of the royal household, an office of great dignity and much emolument. The fatigues of courtly etiquette and the solemn duties of aposentador mayor weighed in course of years heavier by far upon the body and soul of Velasquez than either age or the labours of his artistic career. We can hear with a certain patience of this richly-endowed artist devoting the best years of his life to the painting of royal countenances and the splendours of a solemnly magnificent court, which was at once bigoted and licentious, because through these works of Velasquez's pencil we receive the most valuable historical commentary. But when we read of the duties of this high aposentador mayor being, amidst countless others, of a scarcely more important, but not less tedious, character, than the providing of lodgings for the King and his train in all progresses ; the placing of His Majesty's chair and removal of the cloth when the King dined in public ; the issuing of keys to new chamberlains, and the setting of chairs for cardinals and viceroys who came "to kiss hands," it is difficult to say which feeling becomes most dominant in one's mind, disgust at the stupid blindness of a King who, professing to appreciate art and Spain's greatest painter, devoured this painter's life with ceaseless calls upon him for personal attendance on daily occasions of senseless, solemn etiquette ; or regret that Velasquez should so weakly and complacently have yielded to this slavery of pomp. A

solemn and festive meeting of the two courts of France and Spain, to celebrate peace and the nuptials of Louis XIV. and the Infanta Maria Teresa, having been arranged to take place in the summer of 1660 in the Isle of Pheasants, in the river of Bidasoa, Velasquez was despatched in March of that year to superintend the erection of a magnificent pavilion upon this islet, which, as neutral ground, has witnessed so many strange events connected with the annals of France and Spain. But not alone had the renowned aposentador to superintend the building of this pavilion; but he had to prepare the Castle of Fuenterrabia for the reception of his royal master and to provide lodging for the royal train all the way from Madrid to the Bidasoa; and this gorgeous train travelled with oriental numbers and magnificence. When we read that "the baggage of the royal bride would alone have served for a small army;" that "beside personal equipments she carried a vast provision of presents, amongst which were two chests filled with purses, amber gloves and whisker cases for her future brother-in-law, the Duke of Orleans;" that "the grandees of the household vied with each other in the size and splendour of their retinues;" that "the cavalcade extended six leagues in length, so that the trumpets of the van were sounding at the gate of the Alcalà de Henares, the first day's halting-place, ere the last files had issued from the gates of Madrid;" and that "the whole journey through Burgos and Vittoria was a triumph and a revel," one can form some faint idea of what hurry, excitement and fatique must have overwhelmed the old painter, accustomed even as he had been throughout his life to court etiquette and pompous festivities. Add to which, Velasquez had to await the King's arrival at San Sebastian for two months, superintending his preparations for the reception of the royalties; to be in attendance upon Philip when he did arrive at San Sebastian; and during the three weeks of his stay there, pending the final negotiations, and "when His Majesty's table was sometimes nearly overturned by the throngs of French who came to see him dine;" that he attended Philip to Fuenterrabia and was actively employed by his office throughout the week of pomp which the two courts passed on the frontiers of the two kingdoms. These grand and glorious festivities terminated his career. Though apparently in his usual health during the excitement of his fatiguing avocations, "a report of his death," says Stirling, "preceded him to Madrid, and he found them bewailing his untimely end; but the tongue of rumour had spoken in the spirit of prophecy: his worldly work was done, and fate forbade the pageants of the Pheasants' Isle to be recorded by his inimitable pencil." On July 31 Velasquez was seized, on retiring to his apartments after attendance upon His Majesty, with feverish symptoms, which greatly alarmed his physicians. After receiving every possible attention he expired in the afternoon of August 6, 1660. After lying in state, the body was conveyed with almost royal pomp at night to the parish church of San Juan. Eight days later expired the wife of Velasquez, Juana Pacheco, the daughter of Velasquez's old master and his first biographer. The husband and wife repose in one grave.

Moseley's Theory of the Arch.

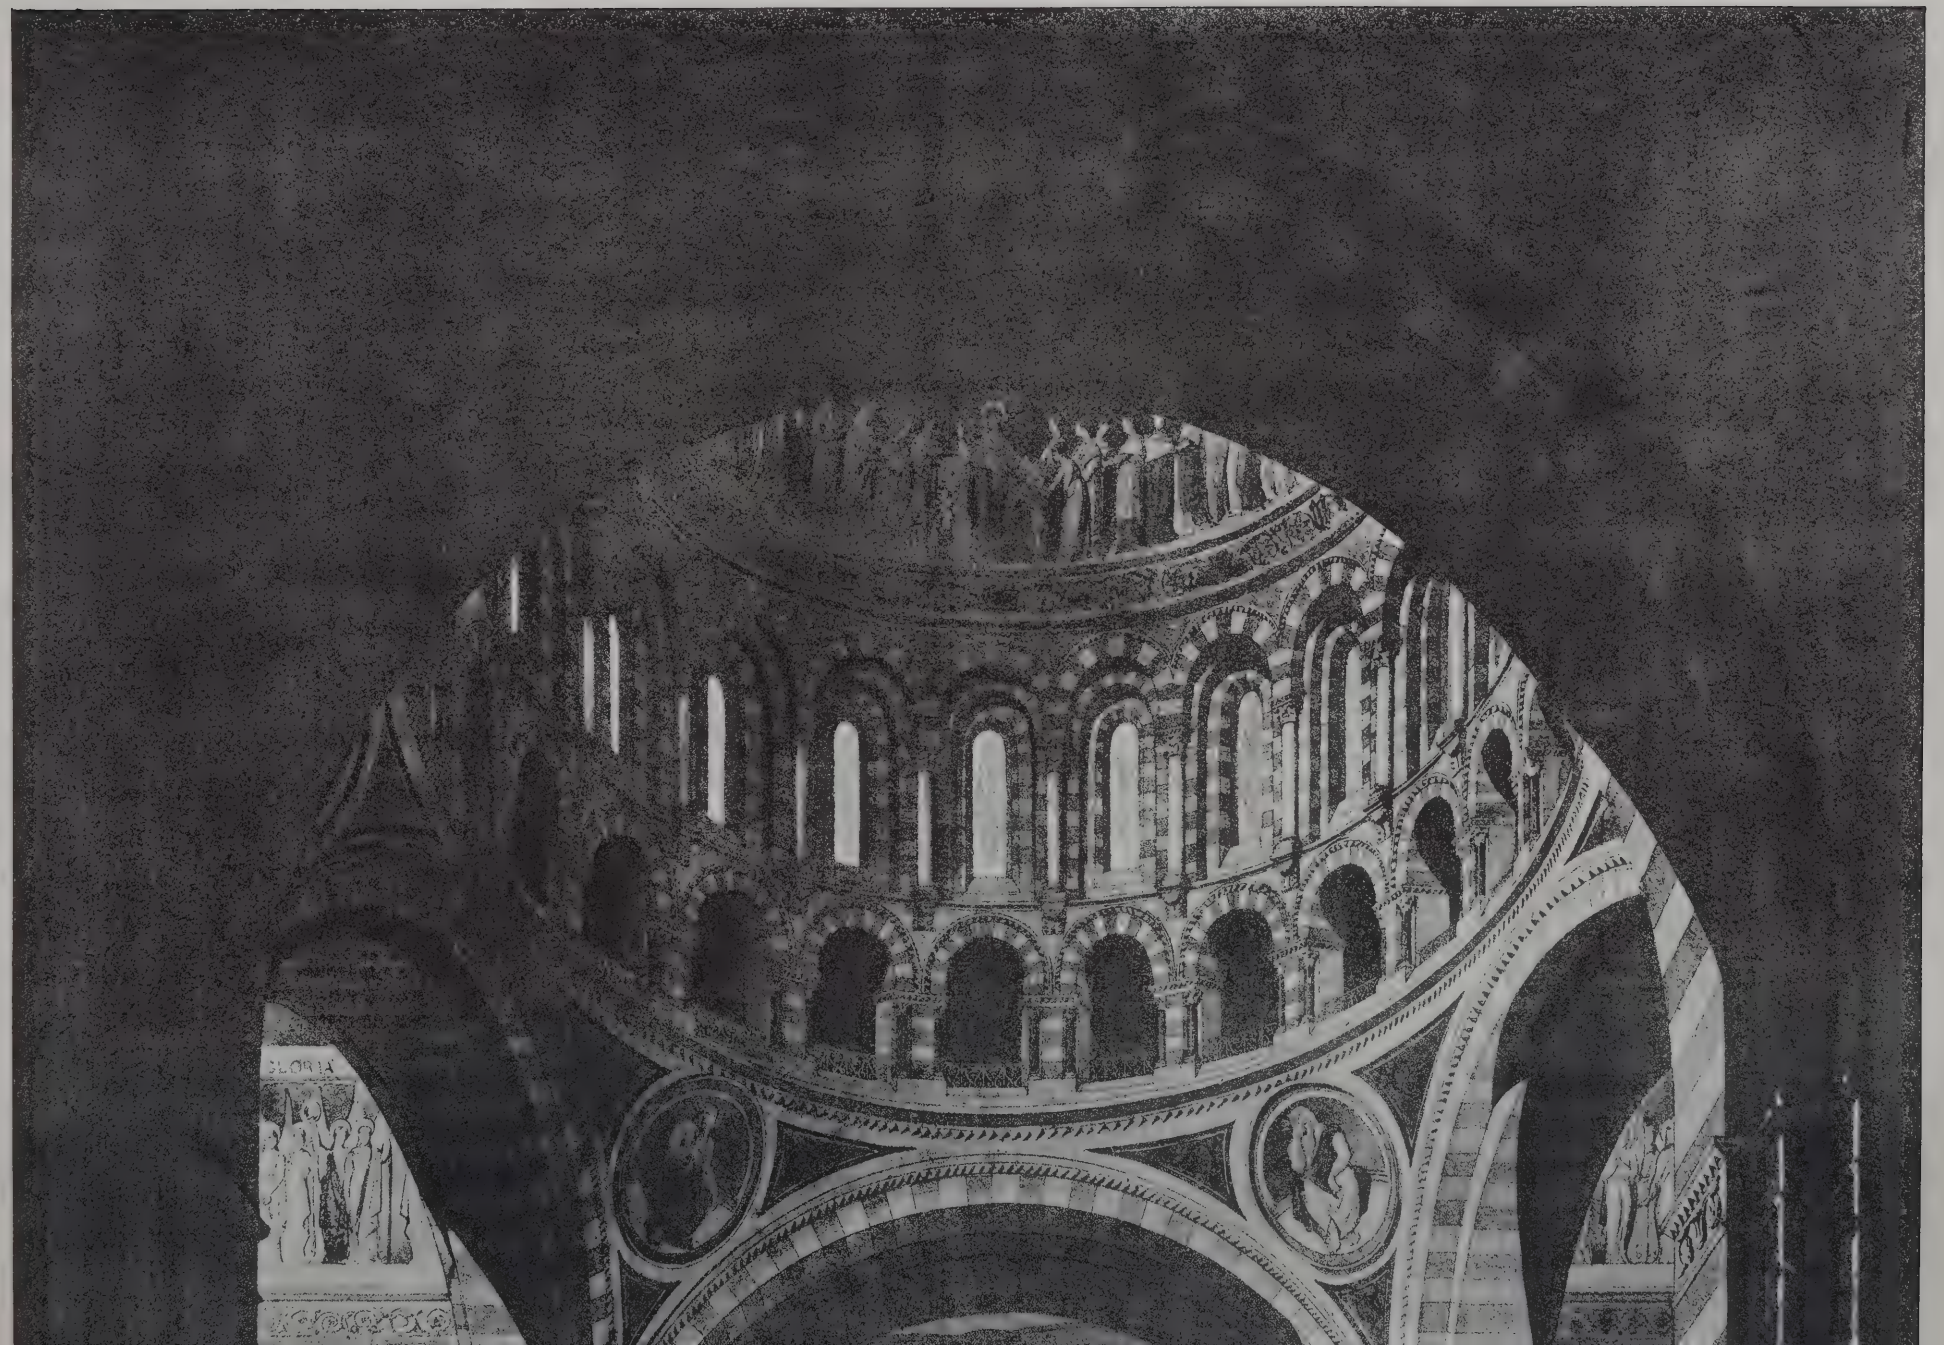
In every structure composed of series of uncemented stones in contact, Professor Moseley supposes the existence of two lines called the line of resistance and the line of pressure. The former line is determined in the following manner:—Each two adjacent stones will exert mutual pressures distributed over their surfaces in contact, and these pressures have a single resultant, that is, might be conceived to be collected at a single point in the surfaces, where they would have the same statical effect as they actually have when distributed over the surfaces. Let these points in question be determined for every two surfaces; then the imaginary line passing through them is the line of resistance. In other words, the line of resistance is the *locus* of, or line passing through, the points of application of the resultants of the mutual pressures of the stones. The line of pressure is determined in the following manner:—From each of the points of application above-mentioned draw a line representing the direction of the resultant. The curve touching all these lines is the line of pressure. In other words, the line of pressure is the curve to which the direction of every resultant of the mutual pressures is a tangent. The line of resistance determines the liability of the stones to turn on their edges; the line of pressure their liability to overcome the friction along their surfaces by sliding past each other. It is then shown that the least horizontal force at the keystone which will suffice to sustain one semi-arch is that exerted by the opposite equal semi-arch. For the pressure so exerted is the measure of the tendency of the latter semi-arch to fall forwards, and is therefore evidently the least force which would sustain it. The same force is therefore also the least which would sustain the former semi-arch, if both semi-arches be exactly similar. Too great a horizontal pressure applied at the crown would cause some joint of the semi-arch to open on its under side, the portion of the arch between that joint and the crown turning about the superior edges of the joint. On the other hand, too small a horizontal pressure at the crown would allow a part of the arch between the crown and a joint of rupture to turn about the inferior edges of that joint. Professor Moseley shows from this consideration that when the greatest and least horizontal pressure consistent with equilibrium is applied, the "line of resistance" touches some point of the extrados or intrados respectively; and that point is the upper or lower edge of a joint of rupture. The position of the point of rupture depends not only on the value of the horizontal thrust, but on the point in the crown where that force is applied. With respect to an uncemented arch, Professor Moseley considers all uncertainty on this head removed by the consideration that, "on the striking of the centres, the arch invariably sinks at the crown, its voussoirs there slightly opening at their lower edges, and pressing on one another exclusively by their upper edges." The author does not probably intend here to assume that the application of the pressure at the summit will be confined to single mathematical lines. Whatever be the material of the voussoirs, it will be, in some degree at least, compressible; and the pressure will therefore be distributed over a finite area of the surface of the joint. The smaller the breadth of that area, the greater the pressure per square inch; and before the breadth could be reduced to a mere line, the pressure per square inch would become so great as to crush the material. It is obvious also that the voussoirs might have such forms given to their surfaces of contact that their upper edges might not press upon, nor even closely approach, each other upon the settling of the arch. In fact, that portions of the voussoirs shall ultimately press on each other may be varied arbitrarily, provided that the surfaces of contact be so formed that the areas of contact be sufficiently large to resist the tendency to crush the material. The course of the investigation then leads to the determination of the point of rupture in the intrados of a semicircular arch; the point of application of the pressure at the summit being assumed. In this investigation the voussoirs are supposed to be of equal depth, homogeneous, and to bear no load but their own weight. Then follow similar investigations for the case where the semi-arch is loaded by a mass of which the upper surface is an inclined plane—the arch and superincumbent mass being homogeneous—and for some other cases. In all these instances the point of application of the pressure at the crown is assumed. As that point is, however, variable, the stability of the structure is not completely ascertained until it be shown that the arch will have no angle of rupture, however the position of that point be varied. The variation of that point affects the value of the horizontal pressure at the crown, and as has been said, if that pressure be reduced too much, there will be a joint of rupture in the intrados. Consequently it is necessary to show that the minimum value of this pressure dependent on the variation does not correspond to a joint of rupture in the structure. And Professor Moseley therefore proceeds to establish the necessary mathematical conditions. The case just referred to is that of the sinking of the crown of the arch. Of course in the corresponding case of the rising of the crown the maximum value of the horizontal pressure applied there has to be determined.

Indian Rock-cut Temples.

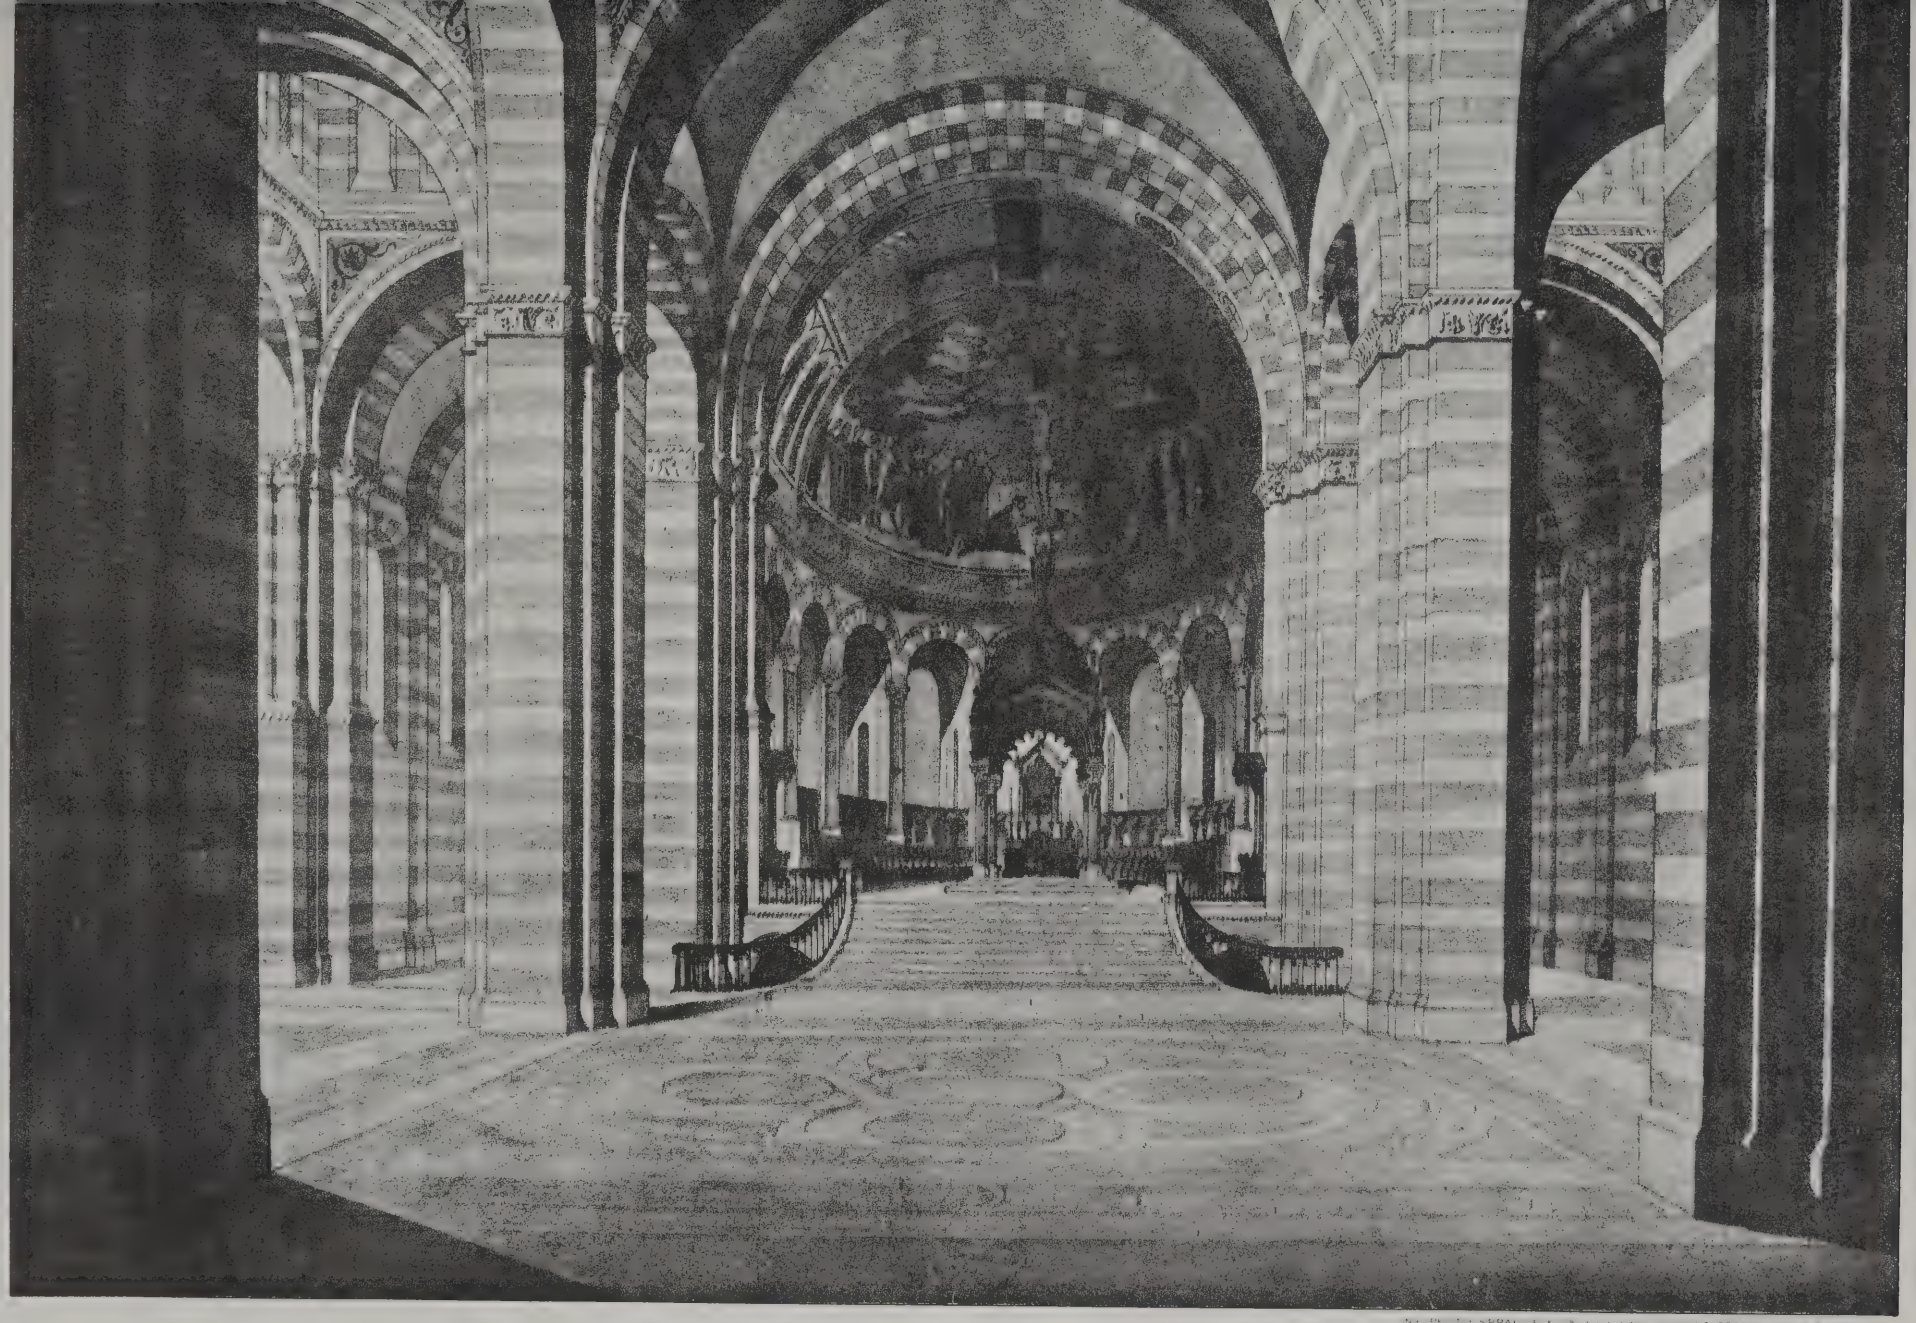
Almost every one who sees these temples is struck with the apparently prodigious amount of labour bestowed on their excavation, and there is no doubt that their monolithic character is the principal source of the awe and wonder with which they have been regarded, and that, had the Kylas been an edifice of masonry situated on the plain it would scarcely have attracted the attention of European travellers at all. In reality, however, it is considerably easier and less expensive to excavate a temple than to build one. Take, for instance, the Kylas, the most wonderful of all this class. To excavate the area on which it stands would require the removal of about 100,000 cubic yards of rock, but, as the base of the temple is solid and the superstructure massive, it occupies in round numbers about one-half of the excavated area, so that the question is simply this, whether it is easier to chip away 50,000 yards of rock and shoot it to spoil (to borrow a railway term) down a hill-side, or to quarry 50,000 cubic yards of stone, remove it, probably, a mile at least to the place where the temple is to be built, and then to raise and set it. The excavating process would probably cost about one-tenth of the other. The sculpture and ornament would be the same in both instances, more especially in India where buildings are always set up in block and the carving executed *in situ*. Nevertheless, the impression produced on all spectators by these monolithic masses, their unalterable character and appearance of eternal durability, point to the process as one meriting more attention than it has hitherto received in modern times, and if any rock were found as uniform and as easily worked as the Indian amygdaloidal traps, we might hand down to posterity some more durable monument than many we are now erecting at far greater cost.

NOTES AND COMMENTS.

ON Monday in last week the committee decided as to the plans to be adopted for the new Sunday Schools, Zion Chapel, Kendal. Six sets of designs were sent in under motto, each possessing undoubted merit. A building committee, consisting of men considered to be the most practical in the congregation, was appointed to examine the plans minutely, and after three prolonged sittings, occupying many hours, they ultimately decided, by four to two, that the design sent in under motto "Light and air" should be placed first in order of merit, and that it should be recommended for adoption; the design under motto "Be his the palm who merits it" receiving two votes. This was subject, however, to a further decision of another committee, consisting of twenty-four members, who after a short deliberation reversed, by ten votes to seven, the decision of the committee whom they had appointed to adjudicate upon the plans, upsetting in a fractional part of the time the laborious work of the first committee. The general plan was pretty similar in both designs, the ground-floor being left for a schoolroom without obstruction, and the first floor being divided into classrooms on three sides, with open space in centre. One of the conditions was that the schoolroom should be lofty and well lighted. The premiated design shows the schoolroom 8 feet 6 inches high; the design placed second shows the schoolroom 12 feet high. The schoolroom averages about 54 feet by 47 feet inside. The decision of this competition shows the desirability of having a professional adviser brought in in such matters, or at any rate it should be made known to intending competitors how many committees are likely to be called on to adjudicate, and how the experience of the committee for the work of adjudication is to be gauged. The design bearing the motto "Be his the palm who merits it," is by Mr. STEPHEN SHAW, F.R.I.B.A., who will carry out the building. The design awarded second prize, and bearing the motto "Light and air," is by Mr. JOHN STALKER, M.S.A., who received ten guineas. Both architects are practising in Kendal.



IN regard to the building trade dispute at Norwich, the Mayor, in a letter addressed to the carpenters and joiners and bricklayers, states that, the masters having made their final offer, he recommends the men's acceptance of the amended code of rules proposed by the employers. The men's endeavour, he says, to better their position will not have proved fruitless, as they would gain some material advantages, and, moreover, there are some hundreds of labourers in the city, willing and anxious to work, who are prevented earning their livelihood by the action of the strikers. In the case of refusing these terms, the Mayor views with apprehension the fact that the summer is fast slipping away, and the probability of another severe winter. He also warns the men that in the event of their declining to act on his suggestion the public sympathy, which has been freely accorded them, may be withdrawn, and he appeals to the men in the interest of the city to make some sacrifice and return to work at the earliest possible date. The result, however, has been that the carpenters have pledged themselves to continue the struggle until the employers give way on the question of lodgings, &c., on country jobs, and the bricklayers have decided to adhere to the Mayor's original set of conditions.



A CASE has been brought in the Wandsworth Police-court, in which the Southwark and Vauxhall Water Company had summoned Mr. CURNICK, an owner of house property, for neglecting to comply with the regulations under the Metropolis Water Act of 1852 and 1871. The question was whether the owner was compelled to make the alterations said to be necessary for a constant supply of water to his premises, consisting of a block of houses in the parish of Wandsworth. It was stated that a serious question was involved, as notices had been served on the owners of property in Wandsworth to carry out alterations which would necessitate an expenditure of 15,000*l*. The Water Company relied on the regulations of 1871, which made it the duty of owners of houses to provide each house with a separate communication from the company's main. It was argued on the side of owners, however, that they were subject to the regulations of 1852, which provided that there may be one communication-pipe for a group of houses where the water-rate was paid by one man, as in Mr. CURNICK's case. The company had a right in 1852 to put on a constant supply of water to the house. They had taken no action for twenty years, and now called upon owners to go to the expense of 5*s*. in some cases and 50*l*. in others. There was nothing in the Act to compel owners to provide the fittings demanded of them by the company. The solicitor to the company stated that the fittings must be made according to the regulations, and that the company were desirous now of making the supply constant instead of intermittent. If the company cut off the supply, the consumer would have to comply with the regulations before getting a supply. To this Mr. CURNICK's representative replied that they would bring an action against the company and recover heavy damages. The summons was dismissed without costs.

THE annual adjudication of prizes to the students of the Royal Hibernian Academy of Arts, Dublin, has just taken place. The judges, Sir THOMAS A. JONES, Mr. P. VINCENT DUFFY, R.H.A., and Mr. F. B. BARWELL, have made the following awards:—A silver medal, in special competition from the living model, to R. S. SHORE; a prize of 4*l*., for the best study from the living model, to C. E. LODGE; a prize of 2*l*., for the second best, to J. O'REILLY; and a prize of 1*l*., for the third best, to HENRY TISDALL; a prize of 4*l*., for the best study in the painting class, to C. E. LODGE; and a prize of 3*l*., for the second best study in the painting class, to J. O'REILLY.

A CURIOUS question is raised by a case at present under consideration in the Dunfermline Sheriff's Court. The Dunfermline District Committee of the Fife County Council, as the local authority for the parish of Aberdour, have asked the Sheriff of Fife to grant an interdict prohibiting the local authority of the burgh of Inverkeithing from selling water for trade purposes, which would interfere with a full domestic supply for the water-supply district of Aberdour. It is alleged that enormous quantities of water are sold to the North British Railway Company for the Forth Bridge; and as the result of this and a continual drain for other trade purposes, the domestic supply for Aberdour is being seriously interfered with, houses situated on a high level having been frequently during the past three months without a drop of water for days. On the contrary, the Local Authority deny the allegations of the complainants, and maintain that they cannot be held in any way responsible for any deficiency which may have been experienced in the Aberdour supply. They allege that complainants are allowing the people of Aberdour to sell water for trade purposes, and argue that this trade-supplying should be stopped before any move was made against Inverkeithing Local Authority and its trade supply. The matter was adjourned till Monday next.

We have from time to time noticed some of the works by M. EMILE MICHEL which have been issued by the Librairie de l'Art, Paris. Originally a landscapist, M. MICHEL has of late years devoted himself to an investigation of the history of the Dutch schools, and he has spared no toil in the study of documents and in the most elaborate investigation of the paintings. The biography of REMBRANDT in the series "Artistes Célèbres" was an indication of the method followed by the author, and it is no wonder the book has met with considerable success. So much thoroughness could not be overlooked, especially in a city like Paris, where knowledge of a subject is so often supposed to be an obstacle to that delicacy of treatment which Frenchmen so often desire. M. EMILE MICHEL has been commissioned by MM. HACHETTE to prepare a large work on REMBRANDT, in which will be comprised a detailed and illustrated history of all the works of the master. About the author's competence for the task there can be no misgiving, and we have no doubt the new book will be among the most important of those which have gained renown for the house of HACHETTE. The publishers have done and are still doing much for art, and it is to be regretted that in this country they have no imitators.

CHURCH OF THE SACRED HEART, MONTMARTRE.

WHEN the project for a new church at Montmartre was first mooted, it was intended to obtain the design through the medium of an international competition. The building was to be Catholic in the full meaning of the word, and it was only right to seek universal aid towards its creation. Accordingly some English designs were sent in, notably one by Messrs. Phené Spiers and Phipps. But in a short time the project assumed a new character. It was held that the new church was to be essentially national, and to be expressive of the hope that the boundaries of France should correspond with those which existed prior to the last war. Accordingly, the style that was alone considered to be essentially French was recommended for the new building. In spite of the splendid work with which Mediæval architects enriched France, Gothic has been taken to be no more than a synonym of German, and the style no longer commands respect. A Gothic church at Montmartre was, therefore, out of the question. Renaissance was considered to be too Pagan and frivolous to be expressive of the aspirations of men and women who united patriotism with piety in their thoughts. Accordingly, the severe Romanesque which was used prior to the invasion of the Goths was adopted.

The fitness of the style was at once recognised. Since the ages of faith there has been no such enthusiasm in contributing immense sums of money as France has witnessed during the past fifteen years. Societies as well as individuals have shown eagerness to be associated with the immense work, and there are no signs that the supplies are exhausted. The crowds that every day come from all parts of France to worship in the new building are evidence of the strength of the principle that is realised by the masonry, and of the readiness to make sacrifices to uphold it.

In spite of the large sums expended, the church at present consists only of the parts which are required for services. All the towers which are necessary to give predominance to the church in a general view of Paris have yet to be undertaken. There is no adornment of any kind, and the altars used are temporary structures. Some years will have to elapse before the architect's design, as shown in the illustrations, will be completed; but the people who use and who have erected the church can wait, and probably would not object if the finished structure became a memorial of the victories of France.

ARCHITECTURAL ILLUSTRATION SOCIETY. SECOND SERIES.

NO. 379.—THE ZODIAC PANEL IN THE PAVEMENT, THE BAPTISTERY, FLORENCE. [R. W. SCHULTZ.]

NEWBURY FIELD CLUB.

AN excursion was lately made to Guildford and Loseley by the Newbury District Field Club, the arrangements for which were made by Mr. Walter Money, F.S.A., of Newbury. A report of the excursion appears in the *Reading Mercury*, from which we make a few extracts as follows.

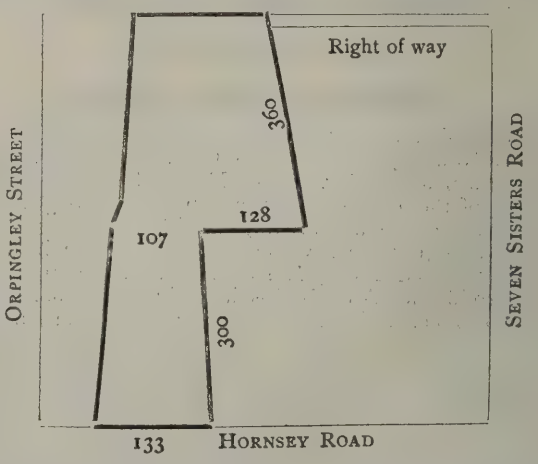
At Guildford the party were received by the Mayor and afterwards visited Trinity Hospital, or as it is more familiarly known, Archbishop Abbot's Hospital, where the hon. secretary read some notes which had been prepared by Mr. Kershaw, F.S.A., librarian of Lambeth Palace, who joined the party in the afternoon. Mr. Kershaw observed that of the three famous brothers, who all rose to distinction, George Abbot, Archbishop of Canterbury, naturally attracts our attention, from having founded the fine and interesting hospital in this town. From a copy of the statutes of that institution, which has long been preserved at Lambeth, I am led to note a few of the more prominent items in those statutes, as well as to give a very short sketch of the archbishop's career. Like his predecessor, Dr. Whitgift, who founded a similar hospital at Croydon, we find the most careful attention to all matters of detail as to the constitution and government of both institutions. In the muniment room at Abbot's Hospital, Guildford, I am told the original copy of the statutes exists as well as the royal charter of King James, both of which documents are fully given in Russell's Life of the archbishop, published in 1777. The copy at Lambeth, however, is presumably almost a counterpart of that of Guildford, and was lent to the Exhibition of Art in that town in 1884. The Lambeth copy of the statutes is on vellum, in a bound book of twenty-nine pages, having at the end the autograph signature of Dr. Abbot, dated August 17, 1629, and on both outside covers the arms of the archbishop, viz. "a chevron between three pears, *or*," attached to the usual bearings of the archiepiscopal see. The pears which appear on the coat-of-arms have given rise to various theories, and one likely supposition is that on the arms of Warden Abbey, Bedfordshire, pears were introduced. Warden pears were much prized by the monks on account of keeping a long time. Pears are sculptured at Jervaulx Abbey in York, and also appear on the arms of Hartland Abbey, Devonshire, and although one cannot arrive at a final decision as to the reason of the pears being introduced in the archbishop's sheld, the close alliance of the name Abbot, also spelt Abbat, with the monastic fraternity, may account for their fondness for pears, and their appearance in the quarterings of one who bore a monkish name. Of the Founders' statutes in MS. 727 Lambeth Library, we remark they are divided into twenty-nine chapters, relating severally to the duties of the master, vice-master, the inmates, residence, repairs to the building, rents and allowances to the hospital and other particulars.

The hospital, which is a somewhat imposing looking structure, is built of brick, in a quadrangular form, with a noble tower at its entrance, with four turrets over the main entrance gate. It was founded and endowed by George Abbot, Archbishop of Canterbury, who, on April 6, 1619, in the reign of James I., laid the first stone. The archbishop was the fourth son of Maurice and Alice Abbot, to whose memory there is a brass on the south wall of Holy Trinity Church. Maurice was married in 1548 at St. Mary's Church, and took up his abode near the bridge, where he carried on the trade of a clothworker or weaver. They had six sons, Richard, Anthony, Robert, George, Maurice and John. Richard was the first master of the hospital, to which office he was appointed by his brother the founder, in 1622. Anthony served the office of mayor in 1598; Robert was in 1615 consecrated Bishop of Salisbury by his brother, George, the archbishop; Maurice became a merchant of the city of London, and was the first person knighted by King Charles I. He was elected a member of Parliament for the City in 1625, and became Lord Mayor in 1638. In 1639, during a period of great distress, he gave 100*l.* to buy corn for the poor of Guildford. John, the sixth son, died at Guildford in 1654, and left certain benefactions to the poor. The hospital or almshouse was intended for twelve poor brothers and eight poor sisters, who were to be unmarried persons above sixty years of age, and who had lived in the town twenty years. At the present time the brethren and sisters receive 8*s.* weekly, with lodgings and fuel and vegetables from the garden. The buildings are of a massive and durable character. The ponderous doors at the entrance are beautifully carved with the archbishop's arms, and in the stonework of the archway is deeply cut the following appropriate motto:—"Deus nobis hæc otia fecit." There is a well-paved quadrangle of 68 feet by 63 feet, with pleasant greensward on the right and left. On the three sides of the quadrangle are the chambers for the brethren and sisters, the master's apartments, the chapel, the dining-hall and the kitchen. The tower contains a splendid apartment, approached by a very fine oaken staircase, the balustrades of which are quaintly and artistically carved, a description which also applies to the mantelpieces and other portions of the rooms. The walls are adorned with portraits of some of the early English reformers. The dining-hall is a splendid oaken chamber, with the old dog chimney fireplace. The chapel is remarkable for its quiet richness and beauty, and the windows are filled by fine specimens of painted glass, from designs by Dürer. The walls of the chapel are embellished with the portraits of Archbishop Abbot, Sir Nicholas Kempe, by Paul Vansomer; and Alderman Jackman, by J. Russell, R.A. The master's rooms are spacious and well furnished, and the quarters allotted to the brethren and sisters are of a comfortable character.

The Free Grammar School, on the opposite side of the High Street, was then visited. Mr. J. C. Honeybourne, M.A., explained that the oldest date that had been found carved in the building was that of 1597, which appeared in one of his private rooms. Some scholar had also carved his name and the date, 1614, on the stonework of one of the windows. The building had been admirably restored by Mr. Edward Lunnon, and Mr. James H. Money, architect, of Newbury, remarked that the trustees were to be congratulated upon the successful restoration. The main building consisted of a schoolroom on the ground-floor, 65 feet by 22 feet, with a refectory and class-rooms above. When the restoration was carried out, the removal of a plaster ceiling in the upper rooms disclosed a fine open-timbered roof, running the entire length of the building. The refectory and class-rooms were converted into one spacious schoolroom, and the fine old oak beams have been emblazoned with the names of some distinguished men who commenced their education here.

On leaving the school the party entered Holy Trinity Church, a large red brick edifice, occupying the site of a very ancient church, founded by the Testards for the benefit of their tenants. The last restoration of the sacred edifice was completed in 1869. Among the ancient monuments, the beautiful canopied altar-tomb to Archbishop Abbot is the most striking. It was erected by the Archbishop's brother, Sir Maurice Abbot, in 1640, and represents the prelate in a reclining position, attired in his episcopal and Parliamentary robes. His right hand rests upon a copy of the Bible, and the head is supported on a pillow. Above is a canopy supported by six black marble columns, bearing nine small figures in attitudes of devotion. The tomb bears a lengthened inscription in Latin. On the north side of the church stands an elaborate cenotaph, to the memory of Arthur Onslow, the famous Speaker of the House of Commons, who died in 1768, and who is represented on the monument as a senator of Rome. At the west entrance there is a tomb to the memory of Lord Mayor Parkhurst.

St. Mary's Church, which stands on the declivity of the hill, was described by the rector, who explained that it dated back almost to Saxon times, and was, he believed, the only church in England which had three apses. It contains some good Norman work, but the edifice was materially enlarged during the thirteenth century, as the character of the windows, side chapels, &c., is completely Early English. Extensive alterations were again made at a later period. Attention was called to the massive columns of chalk, and Captain Payne pointed out a small window known as the "lepers'" window, through which the lepers were supposed to have looked while divine service was being celebrated. The greatest interest, however, centred in the series of mural paintings on the vaulted and groined roof of the apse in the chapel of St. John the Baptist, on the north side of the chancel. Mr. J. G. Waller, F.S.A., who was the first authority to satisfactorily solve the subject of the paintings, states that they are unique in his experience, and especially curious in the manner in which they are associated together. In studying the whole group, with those of the arch in front of the vault, it is obvious one must view them as one subject, viz. "The second coming of our Lord in glory," for the centre of the composition on the upper part of the vaulting has the figure known as "The Majesty," a term of ancient use given to the figure of our Lord seated within an aureole, holding up the right hand in the act of benediction, in the other a book or orb. Two small figures of angels on each side of another face of the vault represent the heavenly host, thus cramped into a small space to make room for the series of subjects beneath, illustrating the religious culture of our ancestors. Commencing the reading from the right side of "The Majesty," the first that presents itself is a figure in a tub or vat, tormented by an ugly miscreant using a pitchfork. Reclining in front of the figure of Christ is a youthful figure in tunic and mantle symbolising St. John at Patmos, whither he was banished. By the side of this figure is a staff resembling that used by the arch-priest in some of the churches of Italy, or the *bourdon* of the pilgrim. The rest of the subjects on this side are undoubtedly from the legend of St. John the Evangelist. It has been suggested that these paintings were executed by William the Florentine, so called in a drawing of 44 Hen. III., 1259, cited by Horace Walpole in his "Anecdotes of Painting," and his presence at Guildford, about the above date, in amending the pictures of the great hall of the castle gives a probability to the suggestion. St. Mary's Church was thoroughly renovated in 1863, from the designs of Mr. T. Goodchild.



The fine old ruined keep of the castle, which forms a conspicuous object among the rest of the town buildings, was visited by a portion of the party, while the remainder lingered in St. Mary's Church to hear the description of the frescoes. The square keep is of Norman character, about 1150, and the present height of the walls, which are 10 feet thick, is about 70 feet. It was a stronghold of some importance, and is first mentioned in the annals of Waverley, under the year 1216, when it submitted to Louis of France, who after landing at Sandwich passed through Guildford towards Winchester, in pursuit of King John. In the time of Edward III. it was appropriated as the common county gaol. The castle grounds are now the property of the town, and the admirable way in which they are laid out is a great credit to the corporate authorities.

Loseley House is a grand Elizabethan structure, which stands in the middle of a charming park, some two miles south-west of Guildford. This district is remarkable for its beautiful scenery. Mr. W. More-Molyneux, the owner of the property, gave an interesting account of the house, which he described as being very much the same as when originally built by Sir William More between the years 1562 and 1568. Loseley is named in Domesday Book as belonging to the Earl of Arundel. After many changes of ownership, it devolved in the reign of Henry VIII. upon Mr. Christopher More, to whom the king granted a free warren and a license to make a park. The house is built of stone, and the main portion faces the north, overlooking a lovely tract of country. The visitors were received in the great hall, which is 42 feet by 25 feet. The walls are ornamented by armour and some good paintings, including portraits of Queen Anne Boleyn, by Holbein; Sir Thomas More, Sir William More and his lady; Sir George, Sir Robert, and Sir Poynings More; Nathaniel, who married Miss Booth, and his lady; Sir Thomas Molyneux, who married one of the two co-heiresses of the Mores; Elizabeth, her sister, who died unmarried; Sir More-Molyneux, his lady, and their eleven children in one large picture. There are also portraits of James I. and his Queen, Edward VI., Queen Elizabeth, &c. Loseley was several times honoured with the presence of royalty. Queen Elizabeth was a frequent visitor, and King James I. and Prince Charles paid visits to the mansion. On quitting the hall the visitors were conducted to the drawing-room, where there is an elaborate chimney-piece of native chalk, and on the cornice the mulberry-tree of the builder, with the motto, *Morus tarde moriens; Morium cite moriturum.* Mr. Molyneux explained that the carving of the chimney-piece was almost identical with a design of Holbein's in the British Museum. Ascending the noble staircase the visitors were conducted to the king's room, where James I. probably slept on his stay here. The ceiling is finely decorated with the Tudor rose, the lily of France, and the thistle of Scotland, and it is supposed that this was done in preparation for the king's visit. The adjoining room, which originally communicated with the king's bedchamber, is known as the queen's room, and the walls of both apartments are covered with rich and valuable tapestry.

THE HORNSEY ROAD BATHS AND WASH-HOUSES COMPETITION.

LAST week the designs submitted in the Hornsey Road baths and washhouses competition, for the parish of St. Mary's, Islington (Hornsey Road site), were exhibited in the Vestry Hall, Upper Street, Islington. Three premiums were offered of fifty, twenty, and ten guineas respectively, for the three best designs in order of merit. Mr. Charles Barry, F.S.A., acted as assessor and selected three designs, of which Mr. Hessell Tiltman, F.R.I.B.A., proved to be the author of Nos. 11 and 20, and Messrs. Spalding & Cross of No. 10. The former gentleman, who, be it noted, obtained first place in the Caledonian Road baths competition, will receive both first and second premiums, while Messrs. Spalding & Cross, who in like manner won two successive competitions for baths in Camberwell, receive the third premium. In all, twenty designs were received.

The accommodation suggested to be provided was as follows:—First-class swimming-bath, 132 feet by 40 feet (water area); second-class, 100 feet by 35 feet; ladies', 75 feet by 25 feet; and 100 slipper baths—20 first-class and 50 second-class for men, and 10 first-class and 20 second-class for women. A laundry for towels and a public washhouse to accommodate fifty washers, with drying closets, ironing-room, &c., engine and boiler-house, and all fittings and machinery—the total cost not to exceed 23,000*l.* The site comprises the grounds of Devon-

shire House and has a frontage of 133 feet towards Hornsey Road; the ground extends from this frontage 300 feet, narrowing to 107 feet, then widens out to the right 128 feet, with a further average depth of 360 feet.

The instructions were to provide for shops (not included in estimate) facing the Hornsey Road, allowing for suitable entrances to the baths and a separate entrance to the public laundry; and further, to keep the buildings as far as possible towards Hornsey Road.

Most of the competitors have placed the public laundry in rear of the bathing establishment, and several have provided

access to it and the boiler-house, &c., from Hornsey Road by means of a roadway. Others have used the whole of the front portion of the site, and have relied on the right of way from Seven Sisters' Road to give access to the laundry. Another point which must have exercised the wits of the conscientious competitor is the close proximity of the property in Orpingley Street to the boundary line, and the, therefore, apparent necessity of building in such a manner as not to interfere with the light and air of this property. With many competitors this consideration has not weighed heavily, including the gentlemen whose designs have been premiated. The point upon which a variety of ingenuity is displayed is the method of access to the buildings, allowing for the shops before mentioned, and it must be admitted that the method adopted in the first premiated design has many advantages. The front block of shops is centrally divided by a gabled archway leading into a quadrangle, on the left side of which is the public laundry, and facing the archway are the entrances to the bathing establishment. No. 12 has a similar entrance through a courtyard, an excellent elevation in Tudor style, and is, with the exception of the pay-boxes—of which there are three—carefully planned and of high merit. The design placed first has a modest but suitable elevation, and is well planned in most respects. The gangway surrounding the first-class bath is too narrow, and the arrangement of slipper-baths not the best from a bath-attendant's point of view. The public laundry, which is in front, is cramped, and the ironing-room is small in proportion; moreover, there is no possibility of extending this department should it be necessary. The large swimming-bath is longitudinally and centrally placed on the front portion of the site, and on the right side is a corridor of ample proportions giving access to the men's private baths and second-class swimming-bath. A similar corridor on the left gives access to the women's private and swimming baths.

In No. 20 the author has placed the large bath towards the right boundary, and shown direct front entrances, omitting courtyard, as in No. 11.

No. 10, the third premiated design, has a pay-box dividing men's and women's entrances in the front block; a long corridor divides the site, and on the right is placed the large swimming-bath, with the second-class in rear of it. The ladies' baths are on the left and the laundry in rear. Both planning and elevations are decidedly good. No. 17 is planned on similar lines to the above.

The following designs deserve mention for good planning and general merit:—No. 6, by Mr. Charles Bell, an economical and well-arranged plan and a neat Tudor elevation. No. 7, by Messrs. E. & T. Brown, is well planned. No. 12, by Mr. Henry S. Hare, has been previously referred to. No. 13, by Mr. Charles Rosher, has a compact, well-arranged plan, and the details show a close acquaintance with bath-work. The elevation to this design is in the same style as that of No. 6.

Owing to lack of space we regret the necessity of having to give such a brief review.

WESTMINSTER ABBEY.

THE final report of the Royal Commission appointed to inquire into the present want of space for monuments in Westminster Abbey has been presented to Parliament. The Commissioners, as a result of their inquiry, have made the following recommendations. They say:—We have to report that space may probably be found beneath the floor of the Abbey for interment for at least one hundred years to come if the duty of granting such burial be discharged sparingly, and with careful regard for the greatness of the national honour thereby conferred. But that no room now remains in the interior of the building for important monumental commemorations. We humbly submit to your Majesty that the memorials, illustrating the history of England for more than eight centuries, which the Abbey contains, are an inheritance of high national interest and value, and that the roll of such memorials ought to be continued. We are of opinion that no interference with existing monuments short of removal or rearrangement on a large scale would provide adequate facilities for this purpose. Such a course we are not prepared to recommend, and we do not think that even in individual cases memorials should be disturbed contrary to the wishes of the representatives of the dead. We find that provision adequate for such commemoration cannot be made in any existing building within the precincts of the Abbey, nor in any place not immediately connected with it. We have, therefore, taken evidence and considered plans for providing at the Abbey an additional place for memorials; and we have further to report that of the various schemes which have been brought before us there are two which we commend as specially suited for the purpose. The one proposes to clear an area now occupied by certain houses in Old Palace Yard, and to erect upon a portion of the ground so cleared a monumental chapel connected with the Abbey at Poets' Corner. We venture to recommend, whether the latter part of this proposal be adopted or not, that no time should be lost in removing the houses in Old Palace Yard above referred to, which not only conceal to a great extent the architecture of the chapel of Henry VII. and the ancient chapter-house, but are also a constant source of danger to the Abbey from fire. The other plan contemplates the erection of a monumental chapel on a vacant piece of ground, the site of the old refectory, lying immediately south of the great cloister and parallel to the nave of the Abbey. We believe that one or other of these last-mentioned schemes would provide a solution of the problem which has been submitted for our consideration. After a careful review of the arguments, we recommend that of the two schemes the latter should be adopted, and that, in order to carry it out, so much of the land required for that purpose as, under the Public Schools Act, 1868, became vested in the governing body of Westminster School, should be reconveyed by statutory enactment, if necessary, to the Dean and Chapter of Westminster Abbey. All which we humbly submit for your Majesty's gracious consideration.

D. Plunket. G. G. Bradley.
A. H. Layard. L. J. Jennings.
F. Leighton. A. Waterhouse.

June 24, 1891. Harold Dillon, Secretary.

We, the undersigned Commissioners, whilst cordially approving in other respects of the above report, feel ourselves obliged to dissent from its last paragraph, which recommends the adoption of the refectory site, and from such other passages as point to that conclusion, and we advise that preference should be given to the site at the south-east of the Abbey.

A. H. Layard.
F. Leighton.
G. G. Bradley.

The report of the Commissioners begins with the consideration of the historical side of the question, after which they state that:—

Before proceeding to discuss the various plans which have been brought before us for providing an additional place for commemoration of the dead at Westminster Abbey, it may be well to consider the possibility of finding the required room in some other way. It might at first sight appear an easy and natural escape from the difficulty which has been created by the absence of plan and want of discrimination shown in earlier times, simply to remove those monuments which it may be thought are least entitled to their present position, either because they offend against modern ideas of taste, or because those whose memories they recall may now be deemed to have been unworthy of such honours. But if the matter be more closely looked into, weighty reasons will be found against this solution of the problem.

For while it is true that something has already been done, especially under the judicious control of the late Sub-Dean Lord John Thynne, the late Dean Stanley and the present Dean, in the way of moving a little, and even reducing in size, some monuments in order to obtain more freedom and light for others, and while we think that something further may well be attempted in the same direction, it is obvious that in any such operations the greatest care must be taken not to offend public feeling and sentiment or to disturb historical associations which, in most cases, have given a special significance to the particular spot occupied by each effigy.

It may be said, generally, that memorials once set up within the Abbey with the assent of the Dean have rarely, if ever, been removed from the building, and have never even been shifted from one place to another within it contrary to the wishes of the representatives of the deceased, who, when known, have always been consulted; further, we were advised on high legal authority that it is extremely doubtful whether anything but an Act of Parliament could authorise the departure from this settled practice, and we are satisfied that if any proposal were now made by legislation or otherwise to interfere on a large scale with existing monuments, it would be met by vehement and well-founded opposition from many quarters.

Again, it has been argued that the cloisters might sufficiently provide sites for future monuments; but in answer to this suggestion it is enough to say that while it would, no doubt, be possible to put up a few mural tablets in addition to those already affixed to the walls, there is no room for any other kind of sepulchral record in those covered walks, which are used as approaches to Westminster School, as well as to the chapter-house, the Abbey and its surrounding residences. The cloister-walks are, even now, found to be too narrow upon festivals and other occasions when unusually large gatherings of people are brought together to attend the church. As to the alternative which remains, viz. that St. Paul's Cathedral should in future receive those memorials of the dead for which scope cannot be found in Westminster Abbey, we examined, amongst other witnesses, Canon Gregory (now Dean) of St. Paul's, and from him we learned that the authorities of the Cathedral would be strongly opposed to such a change, mainly

because little space is still to be found, either in the body of the church or in its crypt, available for the purpose. And even if this objection did not stand in the way, it must be remembered that while many of the greatest of our warriors and some famous artists have there been commemorated, the practice is of but recent origin, and the cases are few in which the distinction has been given to men who have in other ways made their lives illustrious. We doubt that it would be possible to graft upon this comparatively modern and limited practice the older and wider traditions of Westminster, or that St. Paul's would ever, for the purposes of such national honours, hold in the minds and imaginations of the people the place so long filled by the Abbey.

We now turn to the consideration of various suggestions which have been made for "providing at the Abbey an additional place for memorials." The first of these was originally communicated in the year 1852 by the late Lord John Thynne, then Sub-Dean, to Mr. (afterwards Sir Gilbert) Scott, as part of the instructions given for a report on the general condition of the Abbey at that date. The report in question, which is very full and detailed, was in 1854 laid before the Chancellor of the Exchequer (Mr. Gladstone), who appears to have adopted the principle that something should "be done for the Abbey by joint action between the State, the chapter and the public."

A reference to the text of this report (produced before us from the archives of your Majesty's Office of Works) shows that in the mind of Sir Gilbert Scott the principal reason in favour of providing such a building was the expediency of "freeing the Abbey" from a vast number of statues which he regarded as unworthy of their present situation within its walls by reason of their deficiencies in art, good taste, appropriateness or religious sentiment. At the same time, however, Sir Gilbert Scott pointed out that "the object in erecting such a national mausoleum in connection with the Abbey would not be merely to relieve the church of existing monuments, but also for the reception from time to time of new ones"; and he added, "unless the interior is to be entirely crowded up with them, and both the church and the monuments themselves rendered objects of public ridicule instead of veneration and interest, some such step seems to me to have become absolutely necessary."

Other schemes have since 1854 been brought forward with the same object as that explained in the passage of the report last quoted. These suggestions we will now group and consider in order of locality (but not strictly in order of date), as follows :—

1. The addition of a building on the north side of the nave.
2. The adaptation of the existing chapter-house.
3. The acquisition of a site and the erection thereon of a cloister or chapel to the east and south of Poets' Corner.
4. The utilisation of a vacant space adjoining and communicating with the south side of the great cloisters.

1. *Addition of Building on North Side of Nave.*

We have been led to give more than a passing consideration to this proposal, inasmuch as its advantages have been strongly urged by Mr. Pearson, the architect to the Abbey, who stated in his evidence that he had "a great love for" such a solution of the problem, and had thought out two plans for its accomplishment. In Mr. Pearson's opinion the scheme had the distinct advantage of affording a building which "would be an integral portion of the Abbey," and to which, for that reason, the sentiment so strongly attaching to the Abbey would extend, and he gave the following general description of his alternative plans :—

"One of these takes the form of an additional aisle to the nave, with chapels attached for the display of monuments, and with communications leading to it from the west end of the nave and from the north transept. I have not the least doubt that such an aisle, well-designed, in a style which would be distinct from the adjoining part of the Abbey, without being out of harmony with it, would form a great addition to the general effect of the structure, both externally and internally.

"It will be readily understood how well the recesses between the great buttresses and other recesses provided in the plan would lend themselves to the arrangement and display of monuments. . . .

"My second plan takes the form of a double cloister glazed on both sides, enclosing a garth with approaches from the Abbey, similar to the previous scheme. The four sides towards the garth I propose to divide into chapels, by transverse walls, and the recesses formed by the great buttresses of the nave would also be available as before."

Notwithstanding the weight which is justly due to the high authority of Mr. Pearson, we are unable to approve of the expedient he advocates, either on its own merits or as a scheme in competition with others suggested for the south and south-east sites. It is true that neither of these latter would provide a building in such immediate contact with the main body of the church as Mr. Pearson's north aisle would be, but we do not believe that the slightly greater distance at which they would stand could seriously hinder them from gradually sharing with the Abbey the place which it alone now holds in the feelings of the people. On the other hand, the objections are grave and practical; and even admitting that it is free from any difficulties connected with the acquisition of a site, advantage so gained would be outweighed by obvious drawbacks and by the unpopularity which would certainly beset its adoption. His Grace the Archbishop of Canterbury concisely formulates the main objections to such a scheme.

"It (the north side of the nave) is the only part of the Abbey in which you see the whole design of the church by itself; the south side is so entirely blocked up by other buildings, and the east end is so altered by Henry VII.'s Chapel, and blocked by St. Margaret's, the projection of the chapter-house is so great and the alteration of the west end is so great, that there is no other part of the Abbey which gives you an idea of what was the original design of it as a great church. Therefore the erection of any building against it, even if it were a low building, would completely block out the original conception of the Abbey, and would prevent a view of the elevation, and then, amongst all the cathedrals of England, it would be the one which could not be seen. The interior alteration would be also great."

2. *Adaptation of Existing Chapter-house.*

As a seemingly short and simple method of solving the problem, the possibility of making use of the fabric and site of the chapter-house has been urged from more than one quarter. The writer of the articles in the *Nineteenth Century*, which are printed in the appendix to our first report, while dealing with those parts of the Abbey buildings which, in his view, are immediately available for the reception of memorials, says that "the chapter-house and its fine vestibule would furnish further space," and that "nearly 100 monuments, including thirty great statues (colossal, if need be), could be ranged around its walls with magnificent effect."

With the mere object of providing additional room, this adaptation of the chapter-house might perhaps be practicable, but, apart from other considerations, it would be, in our opinion, a grave mistake to disturb the associations and distort the proportions of that most interesting building by diverting it to such a purpose. It is, in fact, a council-room of the State, and might at any time be so used without the leave or interference of the authorities of the Abbey. More than three centuries ago it had passed entirely into the control, and was held as the exclusive property, of the Crown; and the clergy and officers of the Society of Deans and Canons, founded by Queen Elizabeth, have from that time to the present had neither responsibility for nor control over its fabric or the uses to which it had been devoted.

The chapter-house may therefore be considered as being virtually unavailable for the purposes of a monumental chapel, nor is it probable that the approval of Parliament would be given to any scheme which would involve interference with the grace and dignity of its interior, or with the completeness and uniformity of its outward aspect. These observations to some extent apply also to two other plans which were submitted to us; one by the late Mr. Edward J. Tarver, F.S.A., who proposed to build a "wreath of chapels" between the buttresses surrounding the chapter-house, with an entrance porch common to those chapels and the Abbey church. Such a treatment would, in our opinion, entirely change and destroy the character and charm of this ancient and picturesque edifice. The details suggested by Mr. Tarver will be found fully set forth in his evidence.

The other, which is one of four distinct parts of an extensive and costly scheme laid before us by Mr. J. Pollard Seddon, on behalf of himself and Mr. Lawrence Harvey, is almost identical with the suggestions of Mr. Tarver. It is described by its authors as a design for "a cloister of six chapels surrounding the chapter-house. These chapels might be approached from the Abbey through the doorway of Poets' Corner, or through the chapel of the Pyx, which might be opened up by arches in the south-eastern corner of the cloisters." In the opinion of Mr. Pollard Seddon these chapels "would materially improve the exterior effect of the chapter-house," an opinion in which we are unable to concur.

3. *Acquisition of Site and Erection of Cloister or Chapel to the East and South of Poets' Corner.*

A "ground plan of the Abbey and the Abbey buildings," appended to the report, shows that the space between the boundary of the precincts represented by a line on the south-east of the Abbey itself, and a straight line drawn from north to south along the west side of the great cloister, and produced through the dark cloister to Little Dean's Yard, encloses several important features of architectural and antiquarian interest. In addition to the chapel of St. Faith, the chapter-house, with its vestibule and the chapel of the Pyx (the ancient Treasury of the kingdom), all of which are more or less incorporated with the south transept, the area in question

contains the site of an ancient bell tower, the little cloisters, to which several prebendal houses are adjacent, the remains of the ancient infirmary, the Norman cellars under the ancient dormitory, and the site and ruins of St. Catherine's Chapel, whilst just outside the first-mentioned boundary line stands an ancient square tower known as the Jewel House, once no doubt an appendage of the Abbey, but which passed more than 500 years ago into the possession of the Crown, and was used for centuries as the Parliament office or depository of the statutes of the realm. A range of comparatively modern and uninteresting dwelling-houses and stabling, forming the west side of Old Palace Yard and Abingdon Street, flanks this group uninterruptedly from Poets' Corner to Great College Street.

The removal of the houses in Poets' Corner and Old Palace Yard, in addition to, say, the first four houses of Abingdon Street, would unmask the whole of the important area within which the above interesting features are comprised, and would reveal the Abbey structure and its appendages from a point of view whence they have not been seen for centuries. Such an extensive demolition would doubtless involve grave considerations of expediency and expense, which it is not necessary for our present purpose to discuss, but we have found no difference of opinion as to the pressing need which exists for the clearing away of some of the modern buildings in the immediate neighbourhood of the church, if for no other reason in order to keep it safe from the danger of fire.

The first in order of date of several proposals which have from time to time been made for the erection of a building on the south-east site was that of Sir Gilbert Scott, and formed part of his before-mentioned report in 1854. He suggested "a wide and lofty cloister of great length" to be erected at the back of the present houses in Abingdon Street, and to extend nearly from Poets' Corner to College Street. It is clear, however, that whilst the cloister might, in the words of Sir Gilbert Scott, have been made to form "one of the most striking and interesting buildings of its class," it would bear but a remote relationship to the Abbey itself, from which it would be separated by a distance of several hundred feet at the nearest point. Again, the prompt removal of all the houses in Abingdon Street, Old Palace Yard and Poets' Corner would seem to be the necessary corollary to the adoption of the plan, at a cost which must at once put it out of the question. It will be remembered that the primary object was, in Sir Gilbert Scott's opinion, the wholesale and immediate transfer of monuments and memorials from the nave and chapels of the Abbey. The proposed cloister was in fact to be a lumber-room. Certain it is that the scheme, having been submitted to the Chancellors of the Exchequer of two successive Governments in 1854 and 1855, was not dealt with.

In 1857 the same idea was again embodied in a plan submitted by Sir Gilbert Scott with reference to the improvement of Westminster; but, possibly for one or other of the foregoing reasons, it proceeded no further. In 1863 Sir Gilbert Scott was a witness before the Thames Embankment Commissioners, and in his evidence he once more submitted his scheme, but in a somewhat different and much enlarged form. In 1854 and 1857 he had proposed the pulling down only of the houses in Old Palace Yard and Poets' Corner, together with the mews at the back of Abingdon Street, leaving intact for the time the houses in the latter street. In the suggestion put before the Embankment Commissioners he further urged that the whole of the Abingdon Street houses should be swept away, and that a new cloister should be erected to the south of and in line with the Old Jewel Tower. The façade of this structure would have been directly opposite to the Houses of Parliament, and to the open space occupied by the garden and embankment on the south side of the Victoria Tower. This scheme, viewed as a metropolitan improvement, by clearing the whole of the space east of the chapter-house and south of the chapel of Henry VII. as far as the Jewel Tower, would have left the chapter-house and the south-eastern angle of the Abbey buildings fully exposed to view, and would have shown the Houses of Parliament on the east and the Abbey Church with its precincts on the west separated by an open space of magnificent proportions. With regard to the proposed cloister, however, in Sir G. Scott's scheme of 1863, it would have been even less connected with the Abbey Church than in his earlier proposals. The distance from the nearest door of the Abbey would have been about 500 feet, and the cloister itself would not have been "articulated on to the Abbey" in any way. In their report the Embankment Commissioners recommended that all the dwelling-houses should be taken down, saying nothing, however, about the scheme for building on their site, but, on the contrary, recommending that the ground so cleared should be left open.

Although the need became more pressing year by year, the subject appears as a public question to have lain dormant from 1863 down to the year 1881, when Dean Stanley, who had during the interval brought it to the notice of successive Governments, made it the occasion of frequent communications with your Majesty's Office of Works, with the view of enlisting the interest of that Department in the matter. The removal of the old Law Courts from the west side of Westminster Hall was at that time occupying the attention of the Office of Works, and the removal of the buildings on the south and south-east of the Abbey, being a cognate topic, the First Commissioner, Mr. Shaw Lefevre, in considering the question of clearance, took occasion to invite public attention to the existing proposals of Sir Gilbert Scott. The result was a series of representations from the late Mr. Fergusson, partly by way of criticism and partly by way of novel suggestion. Mr. Fergusson expressed his opinion that "no architect that ever lived could render a long unbroken one-storeyed building worthy of the situation," namely, a site facing Old Palace Yard, 200 yards wide, and directly opposite to the Houses of Parliament and the Victoria Tower with which the new building would be in competition. In addition to objections which he suggested on artistic and financial grounds, Mr. Fergusson pointed out that the cloisters, or Campo Santo, of Sir G. Scott, never could be made an integral part of the Abbey, nor even seem to be in direct connection with it."

As an alternative plan Mr. Fergusson then suggested what he termed a new south transept—in other words, a building in more or less immediate contact with the existing south transept, and so arranged as "practically to form part of" the Abbey. In order to secure a site for this structure "it would be necessary to pull down the houses on the west side of Old Palace Yard, and those which encumber the Abbey in Poets' Corner. Beside this, some second-class clerical residences on the site of the old infirmary and St. Catherine's Chapel must be removed."

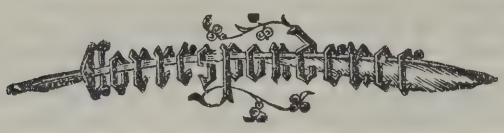
In 1884 the question was brought to the notice of the Government. A change of Government followed soon afterwards, and the matter remained in abeyance until 1886, when a committee consisting of a number of eminent persons was formed for the purpose of considering it, and held several meetings in the Jerusalem Chamber. This committee recommended the erection of a monumental chapel as a memorial of the Jubilee celebration, and suggested that in such a chapel might be grouped together the monuments of statesmen connected with the present reign, so that the Abbey might be relieved, to some extent, from the existing congestion.

In 1888 the committee was reconstituted, and its numbers were increased. Under its sanction a Bill was prepared in order to obtain compulsory powers for the acquisition of the houses in Old Palace Yard and Poets' Corner, with a view to the promotion of a scheme shaped on the lines of Mr. Fergusson's suggestions.

Although less vast than Sir G. Scott's plan, the "new south transept" scheme of Mr. Fergusson would have been extensive and costly. "It would have provided space for monuments very much larger than the existing nave of the Abbey. It would have involved the removal of the houses in Old Palace Yard on the west side, and it would have involved the removal of the canons' houses on the east side of the little cloister. It would have gone up to the college garden, and it would have been behind the Jewel House."

The scheme proposed by the Bill of 1888 was accordingly a modification of Mr. Fergusson's plan. It was not nearly so extensive, and it preserved the leading "idea" of the latter, namely, the device of securing direct communication with the Abbey by means of a cloister or passage carried round the chapter-house through the flying buttresses. Opposition to the proposal came from different quarters. The Society of Antiquaries pointed out that it would involve the destruction of the ruins of St. Catherine's Chapel, as well as of a portion of the ancient wall enclosing the Abbey precincts, which may still be seen almost touching the flying buttress of the chapter-house on the east. In the face of the opposition, the Bill was dropped.

It had been estimated that Sir Gilbert Scott's latest proposal, which involved the removal of all the houses from Poets' Corner to the south end of Abingdon Street, would have cost some 250,000*l.* for the demolition of house property alone, exclusive of a vast outlay in building the proposed cloister. The authors of the Bill of 1888 reckoned, on the other hand, that their scheme, including the acquisition of the site and the erection of the chapel, would not have cost more than 160,000*l.* On its abandonment, the promoters took counsel with Mr. Pearson, the architect to the Abbey, with a view to the preparation of a fresh plan, which would as far as possible disarm the threatened opposition. An alternative design was prepared by Mr. Pearson, which, while it still preserved the idea of access through the flying buttresses of the chapter-house, would leave the ruins of St. Catherine's Chapel, as well as the dwelling-house, No. 5 Old Palace Yard, untouched, and which might be carried into execution at an outlay still further reduced. The total expenditure was estimated by Mr. Shaw-Lefevre at 70,000*l.* or 80,000*l.*



The details were described by Mr. Pearson himself in his evidence before us, and were illustrated by a ground-plan. He proposed that a "monumental chapel," facing east and west (instead of a "transept" running north and south, as suggested by Mr. Fergusson), should be erected on the site occupied by

Nos. 2, 3 and 4 Old Palace Yard, and the ground at the rear of those premises up to the boundary line of the Abbey precincts. This chapel would also be approached from the Abbey through a corridor leading from the door at Poets' Corner, and carried through the flying buttresses of the chapter-house.

(*To be continued.*)

GLASGOW ARCHITECTURAL ASSOCIATION.

ON Saturday the 27th ult. a party of members visited Bothwell Castle, special permission having been granted by Lord Home. Interest in this grandest of Scottish castles was heightened by the knowledge that recent excavations have made considerable additions to its extent. The party was met by an estate official and courteously conducted over the ruins. In one of the apartments was seen a large number of stone shot recently unearthed. The excavations have discovered the twin towers that guard the drawbridge and form the main entrance. There is another circular tower of like size at an angle of the great wall which marks out a space almost double of that formerly assigned to the courtyard. Many disinterred relics were also shown, such as axe-heads, tiles, horn and various metal implements.

Cutler v. North.

SIR,—It is but fair, I think, to the profession and Mr. Cutler to state that in opposition to the expert evidence given by those Fellows of the R.I.B.A. who appeared for Colonel North, Sir Arthur Blomfield, A.R.A., V.P.R.I.B.A., Sir James D. Linton, P.R.I., Mr. Thomas Harris, F.R.I.B.A., and myself were in Court prepared to support emphatically the plaintiff, but it was not thought necessary even to ask for our evidence.—Yours faithfully, ROBERT W. EDIS, F.S.A., F.R.I.B.A.

The R.I.B.A. Council.

SIR,—Being in a rather critical frame of mind and being a great admirer of ancient architecture, I have asked myself on reading the list of names whether the public, if it were asked, would acknowledge that it is worthily represented. For I presume I am right in thinking that the first duty claimed by the R.I.B.A. is, under critical circumstances, to look after the interest of the public so far as it is connected with the architecture of the day. Now and then, as we know, the Council advises the Government to do, or not to do, this or that, sometimes without being even asked for its opinion. The Institute considers it has a mission and acts accordingly. I sincerely hope that it is satisfied with the weight of its opinion and is able to give sufficient proof of it by examples of the acceptance of its advice, *i.e.* the advice of its Council. And I suppose the profession generally—outside as well as inside the Institute—has an interest in the character of the Council, for if it interferes with an architect's work the effect should be so decided that he would not for a moment think of appeal or protest, even if an outsider of the Institute. Now, Mr. Editor, you will see at once that I should not be writing this letter if I thought the Council was what, under the circumstances I have referred to, I considered it ought to be. The eighteen gentlemen are liable to be called upon at any moment to exercise what must be allowed to be the very highest function in the profession. It would show the degree of respect the Council is entitled to if the President of the Institute would say how many of the eighteen he would propose for the royal gold medal when next it is to be given to a British architect who, to use his own words, "may have designed or executed a building of high merit, or produced a work tending to promote or facilitate the knowledge of architecture or the various branches of science connected therewith." I admit there are high-class specialists among the eighteen, and it is clearly proper that they should be there; but the rest, the majority, should be men of larger calibre, instead of, with two or three exceptions, smaller calibre. Where in the list are the Barrys, Cockerells, Smirkes, Fergussons? Then if the Council claims to act for the public, should there not be two or three well-known public men upon it as a means of giving general confidence in its acts?

PRO BONO PUBLICO.

Members of Council (18).

The following candidates are elected:—Thomas Edward Collcutt, 428; Ernest George, 406; John Slater, B.A. Lond., 391; Thomas Blashill, 389; John Belcher, 387; James Brooks, 382; Wyatt Papworth, 373; William Emerson, 370; Alexander Graham, F.S.A., 365, and R. Phené Spiers, F.S.A., 365; John McKean Brydon, 356; R. Herbert Carpenter, F.S.A., 325; John Holden (Manchester), 315; Leonard Stokes, 298; Octavius Hansard, 295; John Alfred Gotch, F.S.A. (Kettering), 290; Edward Augustus Gruning, 289; and Lacy William Ridge, 259.

Extinction of the Architectural Association.

SIR,—I agree with very much Mr. Farrow says in his letter, or I may rather say that he agrees very much with mine. It is quite true that the Association has been constantly developing, and my grievance is that, instead of further development to meet the present needs, an entirely new institution is projected. I am not convinced of the attractions of the Association under the new scheme. It may be the nucleus of the lyric club, string band, camera club and other institutions, doubtless good in their way, but hardly the work of an architectural association; and useful as the lending library has been, I doubt, with the advantages of the Institute lending library available for members (which those passing the examination will become in due course), whether this added to the entertainments and meetings will be sufficiently tempting to retain members paying an increased subscription. As to the financial aspect of the Association, it is quite true there has been a gradual diminution in the available assets, although not in the income, but the expenditure has increased in consequence of the large sums of money expended in entertainments and grants.—Yours obediently,

June 30, 1891. J. DOUGLAS MATHEWS.

International Congress of Hygiene and Demography.

SIR,—It is proposed during the Congress to hold, in connection with Section IV. (architecture in relation to hygiene), an exhibition of drawings of sanitary construction. The committee of this section will be glad to hear from members of the architectural and engineering professions in respect to any drawings they may be willing to contribute. The drawings should necessarily be of a constructional and practical character, and include such subjects as foundations in relation to ground air and dryness, drainage, water supply, lighting, heating and ventilation. It is proposed to exclude perspectives, except bird's-eye views intended to show the disposition of the buildings. The drawings will be exhibited from August 10 to 17, in the library of the University of London, which will be the reception-room of the Congress. The committee reserves the right of making a selection from the drawings, if necessary, and will be greatly obliged by an early response from intending exhibitors.—Yours faithfully,

THOMAS W. CUTLER,
Hon. Sec. Exhibition Sub-committee.

5 Queen's Square, W.C.:
June 1891.

GENERAL.

The Late Mrs. A. Rosette Robertson, of Brighton, has bequeathed to the trustees of the National Gallery fourteen pictures. Amongst the pictures are the Holy Family by Andrea del Sarto, a landscape by Philip Wouvermans, a portrait of Princess Mary of Orange by Sir Peter Lely, a female Saint by Guercino, and portraits by C. Jansen, Van der Helst and C. Van Savoye.

The Death is announced of Mr. W. N. Blair, in his fiftieth year, at Wellington, New Zealand. Mr. Blair was a member of the Institute of Civil Engineers, and Engineer-in-chief and Under-Secretary for Public Works, New Zealand.

The Hampshire Field Club last week made an excursion to Bishop's Waltham. The ruins of the ancient palace of the Bishops of Winchester were visited by permission of Sir William Jenner, who has recently carried out some extensive excavations, laying bare the site of the ancient chapel.

The Annual Meeting of the Incorporated Association of Municipal and County Engineers has just been held. There are 403 members, representing almost every important town in the kingdom. Mr. T. De Courcy Meade, of Hornsey, is president.

Captain Shaw, C.B., chief officer of the Metropolitan Fire Brigade, has decided to retire, and has placed his resignation in the hands of the Fire Brigade Committee of the London County Council.

The "Glasgow Herald" says:—Mr. P. Macgregor Wilson, R.S.W., has been during the past few months making a tour through Persia in search of new subjects for transference to his canvas. In the course of his wanderings he has had commissions for portrait-painting, including that of the Governor of Shiraz. A more important commission, however, was that to paint a portrait of the Shah, and this we learn by a telegram received from the artist he has just successfully completed.

The Architect.

THE WEEK.

As Holbein's picture which was purchased out of the Longford Collection is not visible to the ordinary visitor, who is especially eager to gaze upon the latest acquisitions of the National Gallery, it is no wonder there should be grumbling and hints that the picture was being submitted to mysterious operations in some secret part of the building. The explanations of Sir F. W. Burton should, however, be enough to still the agitation of the angriest of the disappointed visitors. The picture was to be seen in the National Gallery for about three months of last year. But it could not be allowed to remain for a longer period, as it had first of all to be parquetted, or strengthened at the back by cross-timbering, the only method by which pictures painted on panel can be secured against future splitting and warping. In the second place, the heavy coats of discoloured (in parts opaque) varnish, which had long obscured its original brilliancy and neutralised its true colouring, had to be removed. Glazing would, of course, follow the completion of these processes. Owing to the length, severity and gloom of last winter the work was arrested. When the process of parquetting had been at length brought to a close that of devarnishing had to begin, a most laborious and tedious one, demanding the utmost patience and care. In the present instance it was further prolonged by the temporary illness, from influenza, of the restorer. And it may easily be conceived that such an operation cannot be entrusted to every one or any one, or be performed by deputy. Although he is too cautious to promise, Sir F. W. Burton expects that the picture will again be on view in about a month. It appears that the process which had to be gone through has turned out triumphantly successful. This great and most important production of Holbein's pencil, which had sustained surprisingly little injury, is now revealed in that clearness, daylight brightness and transparency which characterise the master's works. Minute delicaciesof finish have also come to light, which can only be found elsewhere in the works of John van Eyck and Albert Dürer.

The annual meeting of the British Archæological Association will be held at York during the week from August 17 to 23. The Marquis of Ripon will preside, and the vice-presidents will be the Bishops of Ripon and Wakefield, Lord Herries, the Dukes of Norfolk and Cleveland, and the Marquis of Bute. The first two days will be employed in an inspection of the cathedral, the city walls, the city churches and the remains of St. Mary's Abbey, with its ancient Hospice, and its museum of Roman antiquities. A day will be spent in a visit to Beverley Minster and the ancient city of Hull; another will be devoted to Ripon and Fountains Abbey, where the party will be entertained by Lord Ripon, and an examination of Selby Abbey Church, the Abbeys of Rievaulx and Byland, and the Collegiate Church of Howden will occupy two days. On the first evening the members will be entertained at a conversazione at the Mansion House by the Lord Mayor of York, and on each of the other evenings meetings will be held in the new Guildhall for the reading of papers, to be followed by discussions. The members of the congress will attend service in York Cathedral on Sunday, and Monday, the 24th, will be spent in a railway excursion to Scarborough, where the party will visit the old Norman Castle and the parish church of St. Mary.

A memorial from men of science and others on the subject of the proposed site for the National Gallery of British Art has been forwarded to the City Corporation through Sir H. E. Roscoe, M.P. They state that, having heard that there was a possibility of the City of London finding a site on the Embankment for the gallery which a munificent donor had proposed to build, they approach the Corporation with an earnest request that they would observe the very great importance of giving effect to the proposal. The memorial already presented to the Prime Minister would have made the Corporation aware of the many strong objections from the scientific point of view to the site suggested for the gallery in the first instance. The greatest city in the world must be the first to suffer if from any cause the proper presentation of science and means for its study by its citizens were in any way crippled. By affording a site on the Embankment, the Corporation would be the means of preventing this lamentable result, and they would earn the gratitude of all interested in scientific progress, as well as confer a great boon on the art-loving public.

The Liverpool Corporation have had a wearisome experience of the difficulties which attend the carrying out of works for water-supply on a grand scale. After obtaining the Act there was a dispute among the engineers, and Mr. Thomas Hawksley found it necessary to retire. The various mishaps attending the attempt to lure the impounded water of Vyrnwy from its picturesque sources into Liverpool need not be again mentioned, but a later incident seems to have considerably taxed the patience of the inhabitants. It is thus described in one of the local journals :—The pipe line has just been completed, and water from Vyrnwy is now being discharged into the storage reservoir at Prescot. None of the Vyrnwy water, however, has yet reached Liverpool. At the meeting of the Water Committee it was stated that, whilst from five to six million gallons daily are being discharged into the pipes at Vyrnwy, less than two million gallons reach their destination. The assumption is that the balance of about four million gallons is lost by the way, it is supposed in the Mersey, from the temporary pipe line, with flexible joints, laid on the bed of the river. Mr. Parry, the water engineer, declined to hazard an hypothesis as to the cause of the defect. Mr. Deacon, he thought, who had charge of the work, had better explain it himself. Mr. Deacon's time is at present taken up in examinations before the arbitrator, and it was not thought well to add to the burdens already on his shoulders. The committee decided to wait till Mr. Deacon was at liberty to discuss the subject. One member expressed his opinion by saying that, though not an engineer, he could have done the work better himself. The town clerk, however, had corresponded with Mr. Deacon, and the latter stated he knew that some of the hydraulic valves would leak, but that in a few weeks they would become tight. The Liverpool taxpayers must derive what consolation they can from the statement.

The Cambridge Syndicate for Local Lectures has issued a detailed programme of courses of study arranged for such of the Extension students who choose to spend a month at Cambridge in the vacation. Practical work in laboratories and museums has been arranged in each of the four sciences—chemistry, physics, physiology and geology. The two art courses are also promised to be illustrated by the valuable collections of casts and engravings in the Cambridge museums.

One of the Governmental problems which await solution in Paris relates to the factory of Sèvres. When France was a monarchy or an empire a State pottery was a necessity. What more pleasing present could be offered to a king or a prince than a vase in the production of which the best artists and potters co-operated? Works of the kind were serviceable helps to French diplomatists. But Government is now carried on under different conditions, and it is doubtful whether a gift of Sèvres pottery would always be accepted with satisfaction. By one of the fictions which pass among courts, a French king could be accepted as being the real inspirer of everything good that came from the factory, but by no effort of the imagination could anybody suppose that M. Grévy or M. Carnot furnished ideas to artists and craftsmen. On the other hand, the authors of the works are ignored, because officialism will have it so. Carrier-Belleuse was such a director as does not appear once in a century; his models were exquisite compositions and he had the faculty to bring out the talents of his assistants. But we doubt if one of his designs has been carried out by his successors. Another style found more favour with the official world. Under these circumstances the *raison d'être* for keeping up the Sèvres factory is no longer manifest. Work that looks as well is to be obtained at an infinitely lower price from potters who are independent of the State, and there can be no doubt the pieces would be as acceptable as those from a national factory.

PAINTING AT THE PARIS SALON.

By Paul Leroi.

HAVING always avoided complaisant criticism, it is too late to begin with it now; and I am therefore forced to declare that painting in France is at the present time passing through a crisis which is one of the signs of decadence. Of this fact there could hardly be stronger evidence than was afforded by the Salon exhibition which has just come to an end. I have no hesitation in saying that among the seventeen hundred and odd paintings which were to be seen there was only one which, from its masterly qualities, is likely to be assured of immortality. This work is the *Portrait of Cardinal Bernadou, Archbishop of Sens*, by M. Elie Delaunay, one of the members of the Institut. It was the only contribution of the painter to the exhibition, but in the eyes of experts it stood apart, and all other works were relegated to inferior positions. The success of the portrait could not be a surprise to anyone who followed the triumphal career of the artist, who is one of the most modest of men, for he lives for art alone, and does not care a jot for the applause of the crowd. The Cardinal is represented standing, and of course is clothed in scarlet. He holds his biretta or cap in both hands, and is about to advance along a red carpet towards the entrance to his cathedral. The background is formed of crimson drapery, on which the arms of the prelate are emblazoned. The painting might be described in the jargon of the day as a symphony in red major, and it will be evident that the master has created difficulties in order that his power might be shown in overcoming them. It is only a great colourist who could venture on such a work, and in this case the artist's science is manifested in every touch. But the portrait is also marked by that superb style which characterises the works of M. Elie Delaunay, with the insight and intensity of concentration which qualify him to rank with the great masters of a past age. The treatment of the head and hands of the subject seems almost a revelation of character. We can see a strong intellect combating with physical weakness. The hands seem to tremble, the body to bend beneath the load of responsibility as of years; but that the will is strong enough to overcome all obstacles is suggested by the movement of the head, the expression of the eyes, and the firmness of the lips. There can be no doubt that M. Elie Delaunay is the most illustrious among contemporary portraitists. He has the gift to confer immortality on his subjects, for their "counterfeit presentments" seem as if they retained the power of thinking. They are not only animated, but intelligently animated.

There are other artists who are more esteemed by Frenchmen than M. Elie Delaunay. This is in a great measure owing to his aversion to coteries and laudations of all sorts. As becomes a great man, he is indifferent to honours and wealth. Art, and art only, monopolises his faculties and devotion. So long as he is allowed opportunities to exercise his genius he is satisfied, and knowing the value of his works, he has philosophy enough to wait for the time when his countrymen will be advanced enough to appreciate them. And yet among those works are some in which the highest decorative skill vouchsafed to this age is displayed. Hereafter his native city, Nantes, will be proud of such a son, and the Murrays, Baedeckers and Joannes will counsel tourists about the value of his paintings to be seen in churches and elsewhere. In Paris, also, there will be amazement when it is discovered that in the part of the Palais Royal used by the Conseil d'Etat there are works by Elie Delaunay which cannot be too much admired, and that there is also a ceiling in the *foyer* of the opera-house by him, which eclipses the neighbouring works by the late Paul Baudry, admirable as are the latter. Among the crowds who visit M. Charles Garnier's building, how many people are there who have heard of M. Delaunay? General opinion attributes all the works to Baudry, and, as history is generally so written, it will be long before the truth is admitted. Fortunately, M. Elie Delaunay's superiority was once formally recognised. At the International Exhibition of 1889 by a unanimous vote the highest of all the awards was assigned to the artist, and this testimony of the world's esteem should be a compensation for the ignorance and indifference of so many of his countrymen. On the same occasion I had also one of the great satisfactions of my life in finding that the English painter, Mr. Orchardson, was also the recipient of a gold medal.

There were other portraits in the Salon which obtained more praise from the Paris critics! However, M. Benjamin Constant's portrait of his wife, the daughter of M. Emmanuel Arago, the French ambassador at Berne, does not become a masterpiece, because the attitude brings to mind Reynolds's portrait of *Mrs. Siddons* in Grosvenor House. Even if the relationship to the English work were less apparent, there are defects of modelling and treatment which should not be found in a work by a talented painter. It is not easy to imagine why two artists who are members of the Institut, M. Falguière and M. Gerôme, should be travestied under the pretext of revealing how they set about work in their ateliers. The representations are feeble to excess. M. Bonnat's single portrait, *Mme. A. C.*, is treated in the manner always adopted by this artist, that is to say, there is a sort of smoky background which may vary according to the colours employed and the accidents attending the composition of medleys, but is always oppressive. From this ground the head is made to stand out *en clair*. This sort of treatment I consider to be anti-artistic, and would reprove it, but it would be unjust to overlook the fact that it has been employed by M. Bonnat conscientiously and with perseverance. It suits such talents as he possesses and which he employs more successfully in portraiture than in historical or religious subjects. For example, M. Bonnat's *Youth of Samson* depicts the Hebrew as an easy victor of a lion that seems formed of caoutchouc, and therefore in a docile way assumes the attitudes of the circus.

The only portraits besides that by M. Delaunay already described which were worth attention came from strangers, and reference may be made to two among them. Mr. James Guthrie, of Glasgow, sent two works which had been exhibited in Scotland, *Rev. Dr. Gardiner* and *Mr. George Smith*. The latter shows a gentleman well mounted, the horse being skilfully painted and forming an *ensemble* that French cavaliers could not fail to admire. The treatment was worthy of the subject; the handling was bold without being coarse, and the colour was robust and harmonious while appearing subdued. Mdlle. Thérèse Schwartze, of Amsterdam, has a virile talent, which I am glad once again to notice. This lady uses the pencil with power, and may be said to have followed the English academician's advice in mixing her colours with brains. Her palette is varied, but a vigorous sobriety is the result. One canvas the portraits of two children, *Didy Chouchou and Paschol*, testified to the qualities of the artist, but they were seen with even more completeness in the energetic figure of *Commandant Général Piet Joubert, du Transvaal*.

It would probably be considered erroneous to class M. Michel de Munkacsy among the strangers who have triumphed over Frenchmen in the last Salon, for the unbounded praise bestowed upon him has, like the fumes of some overpowering incense, made his energy dull while captivating his senses. Last year the artist exhibited a ceiling-painting that was as feeble as it was enormous. This year his decline was more strongly marked by his *Portrait de Mme. B.* The interior in which the lady forms an item is essentially vulgar, and was not worth the representation; the modelling of the figure is surprising from its defects, and a more commonplace scheme of colour could hardly be devised. M. Munkacsy does not appear to become conscious of his defects, but as a man of business he must perceive that the public appear to grow tired before the colossal canvases filled with masses of immature figures, and accordingly he has shrewdly turned back to the Hungarian subjects which first gained him repute as a painter. He cannot be considered to have gained success by his latest attempts. The picture in the Salon represented the interior of a cabaret, with a fiddler playing, and hence the title, *L'Air favori*. The handling is heavy, and the painter employed the darkest combinations of his palette, and hence the general effect was of inkiness.

If M. Munkacsy did not succeed this year, there was compensation to be found in the works by other foreigners, which, indeed, were among the best in the Salon. While French painters of *genre* are yearly losing more and more of

that spirit which gave attractiveness even to mediocre works in the last century, an English artist, Mr. Frank Brangwyn, in his *Un Enterrement à Bord*, displays an intensity of sentiment which is exempt from all exaggeration. One of his compatriots, Mr. Chevallier Taylor, has been no less successful in *The Last Sacraments*. The tonality is somewhat too uniform, but one must ignore defects of technique while admiring the truth to nature which is apparent in all the figures, the pathos which is imparted to the dying youth and the conflicting emotions of the relatives. There is dignity also in the figure of the humble priest, who holds up the crucifix as if he could overcome death and change the final struggle into a victory. It is no secret that the Governmental Commission appointed in France to discover those works which merit to be purchased out of the public funds was arrested by this remarkable work; but the Directeur, who, although a clever writer, is a novice in regard to much that relates to art, declined to approve of the proposal, and France thus loses a work which could impart many a lesson to painters.

The *Departure for the Fishing-Ground*, by an American, Mr. L. P. Dessar; the *Plain Song*, by his countryman, Mr. Walter Gay; the *Hospice for the Aged, Brussels*, and the *Refectory*, by Mdlle. Heyermans, of Rotterdam; *The Viaticum*, by Mr. Middleton Jameson, of Edinburgh; the *Maternal Instruction* and *The Dream*, by Mdlle. Klumpke, of San Francisco; the *Shepherd's Friends*, by Mr. Ridgway Knight, of Philadelphia; the *Portrait* and *With the Burgomaster*, by Mr. W. MacEwen, of Chicago; the *Civil Burial*, by Mr. C. Sprague Pearce, of Boston; and the death of *La Fille de l'Aubergiste*, a fine picture by M. Roeseler, of Hamburg, deservedly attracted the attention of connoisseurs, and if compared with such French works as *Le Cordon Bleu*, by M. Vibert, and the *Whist Party*, 1805, by M. George Cain, would demonstrate how great is the falling-off among French painters.

If the *genre* subjects in the exhibition which came from Frenchmen presented a pitiable spectacle, what is to be said of historical paintings, religious paintings and examples of decorative art? The last branch was upheld in the exhibition mainly by (1) M. Raphael Collin, whose *Ceiling-Painting for the Foyer of the Odéon* was beneath criticism, although corresponding with the style in vogue in the Direction des Beaux-Arts, and when set up will destroy the effect of the fine architectural lines of the foyer; (2) by M. Gabriel Ferrier, who, under the title *Glorification des Arts*, has executed a ceiling-painting for the French Embassy at Berlin that abounds in heresies and banalities; (3) by M. Jean Paul Laurens, whose very big canvas, *La Voûte d'Acier*, has been commissioned for the Hôtel de Ville, Paris. The last work, which deals with one of the preliminary episodes of the French Revolution, is as dull in effect as so many yards of wall-paper. It naturally recalls the charming work by Mr. Orchardson, *The Queen of Swords*, but there is a vast difference between the two in principles of treatment. The English painter has given animation to his figures—one can almost hear the rapiers clash—while M. Laurens, on the contrary, represents the municipal authorities who await Louis XVI. as impassive as so many footmen or operatic auxiliaries. The whole affair appears to bore them, and before such a puppet king as is introduced by the artist it would, perhaps, be difficult to become enthusiastic. A more depressing picture could hardly be imagined.

The vast works which seem like exaggerated chromolithographs, called *La Mort de Babylone* (M. Rochegrosse) and *Mort de Sardanapale* (M. Chalon), cannot be ranked among the historical paintings, and the less said about them the better it will be. It is sufficient to remark of them that they recall the pictures produced so abundantly by the late Gustave Doré, and which were disastrous to his reputation.

As respects the paintings of religious subjects, I must own that I did not participate in the welcome that was given to the *Saintes Maries* by M. P. J. Gervais. There was tact in taking a subject which suggested that the Holy Women of Jerusalem were in a miraculous way transported to the swamps of Provence. But the figures had not that severe correctness which should be characteristic of such a work. This was especially apparent in the woman who is shown as leaving the boat.

M. Henner's mannerism was this year more obtrusive than ever. He has not of late fixed his aspirations very high, for his patrons are easily pleased, but the *Pieta* is below even his average. The picture looks as if executed in "cirage," and one seeks in vain for a trace of skilful modelling. The two pictures, *Judith* and *Magdalen*, by an Italian lady, Mdlle. Juana Romani, of Velletri, who is a pupil of M. Henner, serve as a commentary on the master's manner. Left to herself the artist might have gained some reputation, but she has preferred to make pastiches, and her paintings have a curious interest, for we can see how readily the qualities of M. Henner's works are to be imitated by young people.

If, unhappily, France no longer possesses a Corot, a Rousseau, a Diaz, or a Dupré, she still, however, has conserved a band of landscapists that are exceptional, for, contrary to the general law which now prevails, they grow stronger from year to year. One of the latest additions to these lovers of nature, M. Quignon, by his *Aftermath* has further exemplified the advantages which arise from a frank and independent observation of country scenes. Already he has found an imitator in M. Rigolot, who would, however, do better if he avoided looking at nature through other men's eyes. MM. Yon, Casile, E. Martin, Petitjean, Jan-Monchablon, Jacomin, worthily maintained their reputation by their works in the last Salon. M. Français, who seemed last year to be retrograding, like so many artists, in this year's exhibition was himself again in *Une Source: le Soir*, which was admirably designed; but, as is not uncommon with the painter, was not brilliantly painted, for his palette is wanting in vibration. M. Isenbert, of Besançon, is a modest artist who has never quitted his native place, yet he has made much progress, and at this last Salon he gained a legitimate and unquestionable success by his *Morning on the Doubs* and *Spring in the Environs of Besançon*. I am very glad to have the opportunity to record the fact, for one of the misfortunes of France is that the provinces are becoming depopulated of artists, and the change is supposed to be for the advantage of Paris, whereas the city is encumbered with painters. M. Camille Bernier's *Evening in Brittany* and *Britton Farm* showed in parts that the artist's recent illness was not without its effects on his hand, and it would be more just to await another exhibition, in which it is to be hoped the artist will reassert himself. Each Salon exhibition gives connoisseurs new opportunities to quicken their interest in the works of M. Bellel, who is recognised as a genuine master of landscape, although the crowd are unable to appreciate his austere style, which seems to be produced regardless of all ephemeral applause. His *Souvenir of Provence* and *The Ravine of Chateldon* are superb, producing an impression of grandeur in the mind of the spectator.

For the first time I saw this year at the Salon two paintings by M. Henri Zuber, which have disappointed me. His *Pasture at Bendorff* and *End of the Season, Barbizon*, are two complete errors. Knowing the value of the artist, I could not believe there was any decline of power. I then discovered that M. Zuber had been commissioned to execute two landscapes of a decorative sort, illustrative of summer and winter, for reproduction in tapestry at Beauvais. Having sought out the artist and told him my opinion of his works in the Salon—which coincided with his own—I was able to see the *Summer* and *Winter*, and have no hesitation in declaring them to be veritable revelations which, when seen by the public, will enhance the reputation of the Alsatian landscapist. Hitherto M. Zuber has been known as a learned and poetic interpreter of nature, but critics could not imagine the decorative feeling which he possesses and which qualifies him to be regarded as the inheritor of the best traditions of French art. In his tapestry designs M. Zuber has taken care to avoid any suggestion of easel pictures, and the authorities were for once well inspired when they gave him the commission. His aim has been to produce cartoons in which the modern sentiment of decoration should be adequately expressed, together with respect for ancient traditions. It will be an advantage if his cartoons can be sent to next year's Salon, where admiration will be sure to await them. M. Julien Dupré has shown of late a tendency towards monotony, for he rarely varies his subjects, and seems doomed to turn in a very circumscribed circle. This year he has agreeably

surprised his friends. He has made a new departure under most favourable conditions. His *Road at Mesnil* is illuminated with the rarest justness of effect; the perspective is excellent, the handling full of surety, and the *ensemble* is agreeable to all eyes. Henceforth M. DUPRÉ will be reckoned as one of the best of the French landscapists. An English landscapist, Mr. R. W. A. ROUSE, should not be passed over without recognition. His interesting *After the Shower* has much in it that recalls one of Mr. R. W. LEADER'S pictures in the Universal Exhibition of 1889.

"Still life" continues to have many devotees among French artists, such as MM. ROUBY, RIVIERE, BAIL, EUGÈNE CLAUDE, ATTENDU, BERGERET, DESGOFFE, and a true master, M. ANTOINE VOLLON. But in this field also foreigners are gaining ground, as may be seen from the examples by Mdlle. DE HEM, of Ypres, which are painted with power and refinement.

It would be impossible to notice the drawings, pastels, designs, &c., with any care, for the jury inundated the walls with a strange medley, in which many works were found that were unworthy of a public exhibition. The two that appeared to be supreme were portraits in fusain by Mdlle. BEAURY-SAUREL, which were remarkable for sobriety of treatment and discernment of character.

If in France, as elsewhere, *gravure au burin* is in a dying state, at least it can be said that for some time past praiseworthy efforts have been made to create a renaissance, which it is to be hoped may soon be an actuality, if it were only for the sake of able artists such as M. ADRIEN DIDIER, MM. ACHILLE and JULES JACQUET. At the present time it is etching that triumphs, and there can be no doubt that the etchers have displayed works this year in their Salon in which quality was joined to quantity. At the head is a master whose career has been marked by a series of successes. After making a name as a landscapist, M. THÉOPHILE CHAUVEL has etched his own and other artists' compositions. This year, for the first time, he attacked the figure, and has given a magnificent interpretation of the figure of GOETHE'S "Mignon," after a pastel by an American painter, Mr. JULES ROLSHOVEN, in which the features of the mysterious child are rendered as if they belonged to a girl from the neighbourhood of Florence. M. CHAUVEL has imparted elegance and delicacy to the figure.

Around the eminent aquafortist was a company of the artists who co-operate with him in producing the plates of *L'Art*, of which M. CHAUVEL is the artistic director, and their works display zeal and talent. M. LAGUILLERMIE justified the award of the Médaille d'Honneur last year by his very large plate, *The Young Duke*, after Mr. ORCHARDSON, and which denotes considerable progress in the art. There were also this year interesting examples of lithography and wood-cutting.

WIND-PRESSURE ON BUILDINGS.

A FEW years ago very pointed attention was directed to the question of wind-pressure, on account of an important railway structure being destroyed during a hurricane. Now, although as a matter of fact that work had been designed without any regard being paid to the probable effect of wind-pressure, it is not to be supposed that up to that time wind-pressure had been neglected by engineers, or that anything new was evolved during the investigation which followed the disaster. The result was to authoritatively confirm the opinion that 56 lbs. per square foot may be safely assumed as the maximum direct wind-pressure in the British Islands.

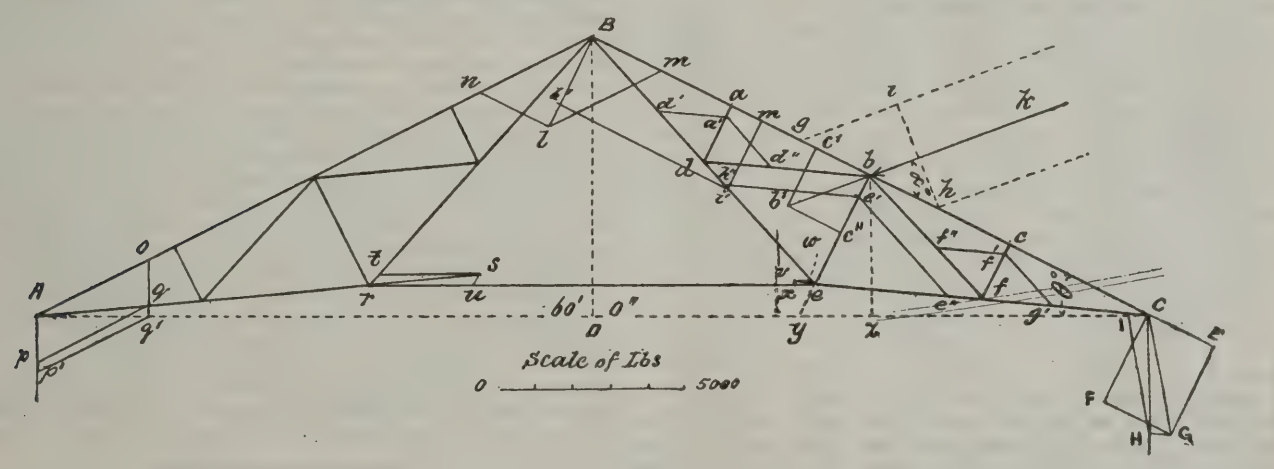
The resultant effect of this pressure upon structures of different classes will be varied according to the direction of its action and the mode in which it is resisted; thus it may be withstood by strength alone and become part of a load, or stability may also be an opposing force. If a work rocks under the action of consecutive gusts of wind a case may occur in which it must ultimately overturn if the wind action is maintained for a sufficient length of time, but this can only happen when the interval between the gusts of wind is equal to the period of one oscillation, to and fro, of the structure; then each oscillation will be widened by succeeding impulses until the point whence recovery is possible is passed. Lofty chimneys are most notably exposed to wind disturbance, and should therefore be carefully designed to withstand it. If executed in masonry it should not only be considered as a whole in regard to its stability, but also any length measured downwards from the cap towards the base must in itself possess the same stability as if it were an independent chimney, for the tensile resistance of the joints is not to be taken as of any value. If we consider any part of the chimney, from the cap down, its moment of stability will be equal to its weight multiplied by half its width or diameter, and this should be at least equal to twice the moment of wind-pressure, for the tendency of the wind is to tilt the brickwork and so bring its weight upon the edges of the bricks, which would be liable to crack off and so reduce the effective width of the supporting surface. The moment of wind-pressure on a square chimney will be calculated as the area of one side multiplied by 56 lbs., and by the height of the centre of gravity of the side area above the point of overturning. The pressure upon a round chimney is one-half of that upon a square one, of which one side is equal to the diameter of the former. When sheet-iron or steel is the material used in the construction of a high chimney, its weight will be insufficient to afford the requisite stability, and it must therefore be steadied by guy rods or wire ropes from the top, and if need be from various points in its height. This latter requirement will depend upon the transverse resistance of the chimney, for when held by the top guys the wind will act the part of a load on a hollow beam, and if its transverse strength is insufficient for its whole height—considered as span—this must be divided by rings and guy attachments at suitable heights. These transverse strengths will be calculated from the usual formula for hollow beams.

With structures of low altitude such high pressures of wind are not encountered, and do not need to be provided for, as is evidenced all around us. Take for instance a boundary wall 14 feet high and 18 inches thick. Let f= overturning force per square foot of surface in pounds. Taking 1 foot run of the wall, the overturning moment will be $f \times 14 \times \frac{14}{2} = 98f$. The centre of pressure of the wind will be half-way up the wall. Brickwork weighs about 112 lbs. per cubic foot, and the wall is 1·5 feet wide; hence the weight of a strip will be $112 \times 14 \times 1{\cdot}5 = 2352$ lbs., and the overturning moment $2352 \times 0{\cdot}75 = 1764$ foot lbs. Equating this with the overturning moment, we have $98f = 1764$ and $f = 1764 \div 98 = 18$ lbs. per square foot; and yet such walls stand. For large structures in exposed places it is necessary to allow the large wind factor; but it is highly improbable that in towns, and at the elevation of ordinary buildings, that the wind-pressure ever reaches 30 lbs. per square foot. Factory chimneys are of course excluded from this estimate pressure.

The effect of wind-pressure upon roofs demands careful attention on the part of the architect or engineer engaged in designing large covered works, and this we will now consider. The force with which we are now dealing cannot properly be added to the load upon a roof because it does not act in the same way as a load which produces vertical pressures. The strains due to the loads should be first calculated, and those due to wind afterwards added to them.

Whether the roof is formed upon rafters meeting in the ordinary way, or is carried by curved principals, it is obvious that the wind cannot be blowing on both sides at once, and it cannot therefore be classed with a load which is uniformly distributed; the principals will become unequally loaded, and in the case of the curved roof some distortion is produced. The normal pressure upon the roof covering will very materially depend upon the angle at which the wind strikes it, and this will always be greater if the wind is blowing across the roof than if its direction is longitudinal, because of the lateral pitch of the roof surface. The direction of the wind in a vertical plane will not necessarily be horizontal; it may to some extent blow downwards upon it. In general cases we may assume that the wind will not take a direction inclined more than twenty degrees to the horizon. For works erected in special localities this particular must be ascertained on the spot. Our example is an ordinary case, such as commonly occurs in towns. It is

no use, and contrary to economy, to make margins of strength in every direction, especially when, as is usually the case, an ample factor of safety is adopted in designing the work.



In figure 1 is shown a diagram of an iron roof of ordinary type, consisting of two trusses, *ABr* and *BCe*, connected by joint-plates at the apex *B*, and by a horizontal tie *re* at the points *r*, *e*. We will consider the wind pressure as acting on the side *BC*. The roof is assumed to be 60 feet span, with a 15 feet rise at the centre. The line *BD*, divided by *DC*, is the tangent of the angle *BCD* of the rafter *BC*, and is $15 \div 30 = 0{\cdot}5$, which we find, from a book of trigonometrical tables, is the tangent of an angle of 26° 34′. The length *BC* will obviously be equal to the secant of this angle multiplied by *DC*. Secant 26° 34′ = 1·118, and $BC = 1{\cdot}118 \times 30 = 33{\cdot}54$ feet. As *BDC* is a right-angled triangle, the length *BC* may also be found by taking the square root of the sum of the squares of the base and perpendicular thus :—

$$BC = \sqrt{(BD)^2 + (DC)^2} = \sqrt{225 + 900} = 33{\cdot}55 \text{ feet.}$$

The difference, which is due to not carrying the decimals further in the first calculation, is inappreciable practically. The length of the rafter is divided into four equal parts by the struts *ad*, *be*, *cf*, and each of these struts carries half a division on each side ; that brings upon it one-quarter of the total pressure on the rafter. The strip of roof carried by each strut will be, in width, $3354 \div 4 = 8{\cdot}385$ feet. Let the principals be placed 10 feet apart from centre to centre, then the roof surface carried by each strut will be $8{\cdot}385 \times 10 = 83{\cdot}85$ square feet. Next is to be ascertained the normal pressure put upon the roof by a current of air with a force of, say, 30 lbs. per square foot blowing down upon it in the direction shown by the line *kb*. Now the wind-pressure as given is measured on a surface square to the direction of the current, such as is shown by the dotted line *hi* ; but on the roof this pressure is spread along the space *hg*, and therefore the pressure per square foot on *hg* would be, calling *P* = the wind pressure per square foot, $P = \frac{hi}{hg}$; but $\frac{hi}{hg}$ = line of angle *hgi*, and this angle is equal to the angle *kbh*, at which the wind strikes the roof, assuming the vertical plane of the direction of the wind to coincide with, or be parallel to, that of the main principal *ABC*. Let this angle *kbh* = *a*, then if *P′* equal the pressure in the direction *kb* on the roof, $P' = P \sin a$. Produce the line *kb* to *b′*, making *bb′* = *P′*. The force carrying the air along will be expended partly in pressure on the roof and partly in continuing its course in a direction parallel to the roof surface, that is, in the directions *be* and *ba*. Complete the parallelogram *bc″b′c′*, then *bc′* will represent the normal pressure on the roof surface, and if we represent this by *P″*, then $P'' = P' \times \frac{bc'}{bb'}$; but *b′c′* is parallel to *bc*, therefore the angle *bb′c″* = the angle *kbh* = *a* ; because the straight line *kb′* falls upon the parallel lines *b′c″* and *bc*. But $\frac{bc'}{bb'} = \sin bb'c'' = \sin a$, and therefore $P'' = P' \sin a = P \sin^2 a$. As this is the only part of this investigation in which we shall use trigonometrical expressions (except in checking a thrust which requires the values of sin *a*), it may be convenient in order to save the trouble of referring to a book of trigonometrical tables, which may not always be convenient, to give here the values of sin *a* and sin² *a* for ordinary pitches of roofs ; but first we must decide upon a maximum value for the angle which the direction *kb* of the wind makes with the horizon in a vertical plane, because the sum of this angle and the angle made by the rafter *BC* with the horizon is equal to the angle *a*. For the class of work with which we are dealing the wind angle is taken as twenty degrees. Let *θ* = the angle of the rafter with the horizon, then in the following table are given the angles made by the rafters with the horizon, and the secants of those angles whereby to calculate the rafter lengths, the values of sin *θ* for checking the thrusts above referred to, and the values of sin² *a* for determining the normal pressures upon the roof surface.

The first column A contains the ratios of span to rise of roof. We will now proceed to resolve the stresses on the roof bars by parallelograms of force. For this purpose a diagram should be drawn to a convenient scale, such as a quarter of an inch to a foot, to allow the stresses to be measured up with accuracy. It is of no advantage though

A	θ	Sec. θ	Sin. θ	a	Sin.² a
4	26° 34′	1·1180	0·4472	46° 34′	0·5274
4½	23 45	1·0925	0·4027	43 45	0·4782
5	21 48	1·0770	0·3714	41 48	0·4442
5½	19 59	1·0640	0·3417	39 59	0·4128
6	18 26	1·0540	0·3162	38 26	0·3863
7	15 57	1·0400	0·2748	35 57	0·3341
8	14 3	1·0306	0·2427	34 3	0·3136

to make the parallelograms excessively large, as in that case the instruments used in drawing them are not so well under control. For this purpose it is preferable to use two set-squares, one riding upon the edge of the other, as parallel rulers are not always to be relied upon. From the foregoing formulæ and the table it is found that the normal pressure at each of the points *a*, *b* and *c* on the rafter *BC* is $= P \times \sin^2 a \times 83{\cdot}85$ square feet $= 30 \times 0{\cdot}527 \times 83{\cdot}85 = 1325{\cdot}67$ lbs. We will first deal with the local stresses on the truss *BCe*, due to wind-pressure. On *da* and *fc* mark off to scale *da′* and *ff′*, each equal to the load 1327·67 lbs. Complete the parallelograms *dd′a′d″* and *ff″f′g′*, then *dd′* = *dd″* = *ff″* = *fg′* = 1807 lbs. by scale. This will be the stress put upon the bars *bd*, *bf*. There will also be a like stress on the bars *dB* and *fC*. Half the load at *a* and half that at *c* are carried by the ties *bd* and *bf* to the point *b*, so the strut *be* has with its direct load a stress of 2651·31 lbs.; make *ee′* equal to this and complete the parallelogram *eh″e′e″*, then *eh″* = *ee″* = 3615 lbs., which is the stress on the bars *ed*, *ef*. These stresses pass to the point *B* and *C*, therefore the stresses on *Db* and *fC* will become 1807 + 3615 = 5422 lbs. From *B* along *Be* mark off *Bi″* equal to this stress and complete the parallelogram *Bh′i″m′* ; *Bm′* represents the thrust on the rafter *BC*; it scales 5048 lbs. This is equilibrated by a similar thrust from *C* towards *B*, and the local stresses in truss *BCe* balance each other. The stress *Bi″* is at *B* resolved into a stress *Bm′* and a force *Bh′* acting in a direction normal to the rafter. At *B* there also acts in the same direction the wind-pressure on half the width *Ba*.

This is equal to 662·83 lbs., and is to be added to *Bh'* by producing it to *l*. The force *l* is resolved upon the two rafters *BA*, *BC* by the parallelogram *Bnlm*; *Bn* is the thrust on *BA* and *Bm* the thrust on *BC*. From *A* mark off *Ao=Bn* and draw the parallelogram *Apqo* with the sides *Ap* and *qo* vertical. The thrust *Ao* is then resolved into a vertical pressure *Ap* upon the support at *A* and a tensile stress *Aq* on the tie *ar*. Produce *Ar* to *s*, making *rs* equal to *Aq*, and complete the parallelogram *rtsu*, then *ru* represents a tension of 2750 lbs. upon the tie-bar *re*, which joins the lower parts of the trusses *ABr* and *ACe*. We will next deal with the thrust *Bm* on the rafter *BC*. This is additional to the local stress *Bm'*. Produce *BC* to *E*, making *CE=Bm*. At the point *C* there will be a normal force equal to *Bl* which acts at *B* (ascertained in a manner similar to that used in determining *Bl*); draw *CF* to represent this and complete the parallelogram *GFCE*; *CG* will be the resultant of these two pressures, and it must be resolved between a vertical line of pressure on the support at *C* and the tie-bar *Ce*. Draw the parallelogram *CGHI*, making the line *CH* vertical, then *CI* will represent the tension on the bar *Ce*. Produce *Ce* to *v*, making *ev=CI* and complete the parallelogram *exvw*; *ex* shows a tension of 545 lbs. upon the tie *re*. The tensions on the horizontal tie do not balance, but leave an excess of 2750−545=2205 lbs. The stress on *re* will pass through the tie *Ce* to the bed-plate at *C*, and on the tie *Ce* the stress will become equal to *rs*=3000 lbs. There will also be an additional stress on bar *Be* equal to *tr*, which represents 375 lbs.

This unbalanced lateral force is due to the side pressure of the wind; how much of it will pass along the main ties *AreC* will depend upon the condition of the bearings. If *A* were absolutely fixed, the wind thrust *Ao* would be taken up by its horizontal resistance, but if it were free to move, the stress would pass to *C*. If the roof is carried on columns or walls, capable of yielding, it is probable that the displacing force will be divided between the bearings, but in what ratio it would be difficult to surmise. Under these circumstances it is necessary—to be absolutely safe—to allow for the whole stress to pass through the tie. As these computations have involved the use of consecutive parallelograms, it may be well to check the results by a trigonometrical calculation showing the lateral displacing force. We must first resolve the thrusts *Ao* and *CG* horizontally instead of along the ties *Ar* and *Ce*. To resolve the thrust *Ao* horizontally and vertically, complete the parallelogram *Aoq'p'*, the *Aq'*, then horizontal outward thrust, scales 2972 lbs. Similarly at *C* will be found by resolving *CG* horizontally and vertically an outward thrust of 591 lbs.; the difference of these, 2972−591=2381 lbs., is the resultant displacing force found by the parallelogram method. To check this produce *Be* to meet the horizontal dotted line *AC* in *y*, and draw *bz* at right angles to *AC*. Let *by* represent the whole normal wind-pressure on rafter *BC*, then *bzy* will represent half a parallelogram resolving this pressure vertically and horizontally. The horizontal force is shown by *yz*, and the vertical by *bz*. Let *M*=the horizontal force, *V*=the vertical force, and *L*=the total normal pressure=5302·62 lbs. The triangles *Cby* and *bzy* are similar, and the angle *ybz*=the angle *yCb=θ*. Therefore

$$M=yz=by\times\sin.\ \theta=L.\ \sin.\ \theta=5302{\cdot}62\times0{\cdot}4472=2371 \text{ lbs., and}$$

$$V=bz=by\times\cos.\ \theta=L.\ \cos.\ \theta=5302{\cdot}62\times0{\cdot}894=4761 \text{ lbs.}$$

The first is very close to the previously obtained figures 2381, being less than a half of one per cent. different, and if the vertical components of *Ao* and *Cg* are measured an equally close approximation will be found for the vertical force.

The tensile and compressive forces thus found on the various bars are to be added to those due to the vertical load, which are ascertained in the usual manner. The quantities to be added in our example are as follows:—

On rafter *BC*, stress *Bm'*=5048 lbs.; on tie *de*, stress *eh''+tr*=3615+375=3990 lbs.; on the *BD*, stress *eh''+dd'*=3615+1807=5422 lbs.; on tie *re*, stress *ru*=2750 lbs.; on tie *ef*, stress *rs+ee''*=3000+3615=6615 lbs.; on tie *fC*, stress *rs+ee''+fg'* = 3000 + 3615+1807=8422 lbs.; on each strut *ad* and *cf*, stress *da'*=1325·67 lbs.; and on strut *be*, stress *ee'*=2651·31 lbs.

Of course both trusses *Abr* and *BCe* must be made alike, as the wind may blow on either side of the roof.

In applying the principles explained above to crescent, girder or other forms of trussed curved roofs, it will be necessary to determine separately the normal pressure of wind at every point at which the stress is taken up by the structure, as on account of its convexity the angle at which the wind strikes it will be different in different parts. At each point it will be sufficiently accurate to take as the wind-pressure angle the angle at which it would strike a tangent to the roof at that point.

ST. MICHAEL'S, COVENTRY.

A MEETING of the general committee for the restoration of St. Michael's Church and spire was held this week at St. Mary's Hall, Coventry, the business being "Arrangements to be made for discharging the balance to the architect and contractor and outstanding liabilities on the restoration account." The Rev. J. R. Mills, D.D., vicar, was voted to the chair. Mr. A. Seymour, hon. secretary, gave an explanation of the finances of the undertaking, in which he said that not only had the late Mr. Woodcock promised to pay into the bank a further sum of 500*l.* during the week of his illness, which terminated fatally, but a cheque was actually drawn and signed, but not paid into the bank. Long negotiations had been carried on with the Charity Commissioners, with the result that they had consented to the mortgage of the church estate for 4,500*l.*, which was to be repaid by means of a sinking fund at the end of thirty years. The appeal to the donors to subscribe a further 5 per cent. upon the amount they had already subscribed had not produced as much as had been expected—only something under 100*l.* The total amount of income from subscriptions, &c., had been between 33,000*l.* and 34,000*l.*, and the total liabilities 38,963*l.* 7*s.* 2*d.*, against which payments had been made of 33,926*l.* 5*s.* 4*d.*, leaving a balance due of 5,937*l.* 1*s.* 10*d.* After reckoning up all the possible sources of income, there was an outstanding balance of 756*l.* Mr. Thompson, the contractor, had been written to, and had promised to assist the committee by making an abatement of 2½ per cent. if the balance of upwards of 5,000*l.* due to him were promptly paid; and it was decided to request Mr. J. Oldrid Scott, the architect, to also make some abatement from his charges, which totalled up to over 1,800*l.*, including travelling expenses. After a long and desultory discussion, during which it was stated that Mr. Woodcock's solicitors had intimated they should pay the 500*l.* which he had last promised, and that the Charity Commissioners would not consent to the completion of the mortgage until all the outstanding liabilities had been paid or guaranteed, Mr. W. Andrews proposed, and Mr. E. Mander seconded, a resolution approving of the action of the churchwardens, &c., in mortgaging the estate, and appointing a committee to take the necessary steps to raise the balance required. This was carried unanimously.

TESSERÆ.

Ancient Dials.

THE first sun-dial that was set up in Rome was erected by Papyrius Cursor, about the year of the city 447; for Pliny says there was no mention in any account of time, but of the sun's setting and rising. This dial was set up in the temple of Quirinus, but it went not right. About thirty years after this, M. Valerius Messala, says Varro, being consul, brought out of Sicily, from the taking of Catana, another dial, which he set up on a pillar near the rostrum; but it not being made for that particular latitude, it could not go true. Nevertheless they made use of it for eleven years, and then Marcius Philippus who was censor with Lucius Paulus, set up another that was more exact. The Greeks also were a long time without clocks and sun-dials. Some ascribe the invention of sun-dials to Anaximines Miletius and others to Thales. There are many kinds of dials mentioned by Vitruvius; as one invented by Berosus the Chaldean, which was on a reclining plain, parallel almost to the equinoctial; there was an half circle upon it, and thence it was called hemicyclus. Aristarchus Samius found out the hemisphere-dial. And there were some spherical ones with a needle for a gnomon. The discus of Aristarchus was an horizontal dial, with its limb raised up all round to prevent the shadow from extending itself too far.

Sir Godfrey Kneller.

According to Professor Ackermann, who has hunted up all the memorials still extant in Lubeck, the family name was Kniller. His father, Zacharias, was born on November 16, 1611, in Esleben, and was inspector of mines to Count

Mansfeld, who figured in the Thirty Years' War, but being compelled to seek a retreat in Lubeck during those troubled times, he turned his taste for drawings and mechanics to account, and in 1659 he became overseer of the works, and building curator of St. Catherine's Church and College, an ancient and extensive Gothic pile, used to this day as the gymnasium, library and picture-exhibition premises of Lubeck. According to the registers of this church, old Zacharias Kniller, who had, in October 1639, married Lucia Beuten, had four sons, Zacharias, John, Godfrey and Andrew, born in 1642, 1644, 1646 and 1649. Godfrey Kniller was, therefore, born on August 8, 1646, and not in 1649, as is usually stated. He was destined for the military profession, and sent to Leyden to pursue his studies in mathematics and drawing, but the muse had the upper hand in a generation when Holland swarmed with clever draughtsmen, brilliant colourists of land and water, and humorous observers of real life. It was in the school of Ferdinand Bol at Amsterdam that he went through his apprenticeship to this charming art, and the large, noble style of this master, as well as Kniller's admiration of, and personal acquaintance with Rembrandt, led him away from the minuteness of the Dutch cabinet school. On his return to Lubeck he painted the well-known picture of *Youth Instructing Age*, in the golden tone of Rembrandt, a charming work, but certainly without the magic power of the great prototype. It still hangs on the walls of St. Catherine's Library at Lubeck. After a visit to Italy, where Guido, Albano and Sasso Ferrato had brought the silver tone into full vogue, he settled in England. Then began that long series of portraits of azure-clad maids of honour, whose blonde ringlets floated amid trim Dutch gardens and close-clipped yews, and those naval and military heroes of the wars of William and Anne with curling battle-smoke and foam-crested waves in the background, and in the middle distance disporting Neptunes and Naïads, the appropriate and habitual population of the Nore and the British Channel. With a flowing tide of court favour, fame and gold, Kniller, now Sir Godfrey Kneller, glided pleasantly down the straits of life, equally remote from the Scylla and Charybdis of British party, on which many a bigger craft had been irretrievably wrecked.

Early Perspective.

Perspective, *perspectiva*, is an old name for optics. In this sense it was used, for the first time perhaps, by Roger Bacon, whose friend and pupil, John Peckham, Archbishop of Canterbury, did as much to spread the word as any one by his work on optics, "Perspectiva Communis," which lived till the invention of printing, and then went through many editions. In spite of doubts recently raised it may be assumed that Bacon's "John of London" is no other than Peckham, and that he is also the "Auctor Perspectivæ" to whom Bacon refers in the "Opus Tertium." If so, it is some proof of the notoriety which this work had attained that Bacon distinguishes Peckham by reference to the optics, when really quoting one of his logical works, of which it is otherwise known there were several. Peckham, or Peccamus, is of that notoriety under which a name is transfigured. Baldi, while calling him Betsan, laughs at the ignorance of those who call him Pisano; and Schott calls him Pethsan. All the authors on *perspectiva*, optics, are set down in one place and another as writers on what we now mean by the word: Bacon, Peckham, Alhazen, Vitello, &c. Some historical epitomists have even given critical accounts of the draughtsmanship of these optical writers, praising or blaming their manner of performing processes on which they never cast a thought nor wrote a line. The earliest work on perspective in catalogues is the "De Sculpturâ" of Pomponius Gauricus, Florence, 1504, in which *perspectiva* is a title-page promise. And this means optics if anything; and the optics is about the eye, which, we are informed, may be large, small, middling, prominent, &c.; after which we are introduced to the nose. Those who made catalogues did not look into books; those who looked into books did not correctly say what books they used: and these two negatives do not make an affirmative, unless positive falsehood or absolute confusion have a right to the name. The old sense lived in our language until after the Revolution. The small pocket Galilean telescope, which we now call an opera-glass, was the perspective glass, the pocket perspective, of Swift and Defoe, through which Gulliver watched the Blefuscuans and Robinson Crusoe the cannibals. And the word here does not mean a thing to spy through, but is a synonym of optic; the "optic-glass" would have done as well, and was, in fact, a tolerably common technical name. So that the readers of Milton should be aware that though "Tuscan artist" is undoubtedly poetry for Galileo, "optic-glass" is merely prose for a telescope.

Water Pipes of Alder.

Formerly the large alder was much esteemed for such parts of works as lie continually under water, where it sometimes became as hard as stone, but if suffered to lie exposed to the weather and at other times under the ground in watery places, it decayed in a short time. Vitruvius informs us that the morasses about Ravenna, in Italy, were piled with alder timber, in order to build upon, for which use he highly commends it. The Rialto, at Venice, is said to have been built upon piles of this wood. Trunks of trees or poles of alder were at one time much used in England for water-pipes for the conveyance of water through bogs and dams, and also for water-pipes for conveying water to supply houses from any spring. Large poles of trees of this wood were also used for ground-cuts. The poles were about 8 or 10 inches diameter, and the cavity in them about 4 or 4½ inches. But for water-pipes, poles above 4 or 5 inches diameter were sufficient, with the cavity about 1¼ inch or 1½ inch diameter. The method of boring alder pipes was as follows. The poles being laid on tressels of a proper height to rest the auger upon while boring, the men set up a lathe to turn the least end of the poles to fit them to the cavities of the great end of the others. The lathe being set up and the poles cut to the lengths they would conveniently hold, 8, 10 or 12 feet, they turned the small ends of the poles (about 5 or 6 inches in length) to the size they intended to bore the larger ends (about the same depths, viz. 5 or 6 inches). It was generally intended to make a joint to shut each pair of poles together; the concave part being the female part, and the other part the male of the joint. In turning of the male part they turned a channel in it, or a small groove at a certain distance from the end; and in the female part they bored a small hole to fit over this channel. This being done, they bored the holes through, and, to prevent them from boring out at the sides, they stuck great nails at each end, to be a guide to them in boring straight through, though they usually bored them at both ends, by which means, if a pole were crooked one way they could bore it through and not spoil it. The holes being bored, they formed them into pipes in the ground, for which purpose they dug a trench, and prepared it with clay to ram in the concave part, which was first bound with an iron ring round it to prevent it splitting. Afterwards they drove in the convex part till the groove in it was just under the hole, and poured melted pitch, hot, into the hole in the female part. By this means the junctures were rendered very compact and close, and they proceeded until they laid all their poles or pipes in their order.

Wood of Bath.

John Wood, commonly spoken of as "Wood of Bath," was an architect of considerable repute and merit in the time of George II., in ability and taste little, if at all, inferior to any of his contemporaries, although he has obtained less notice from architectural and biographical writers than some of them have done. In fact, very little can now be collected relative to him, beyond what he himself has incidentally told us in his "Description of Bath." That city is indebted to him for its architectural fame; and he may be considered as having there introduced a style of street architecture till then quite unknown in this country, by combining a number of private houses into one general design; and, although such mode of producing continuous façades was afterwards adopted by the Adams, was followed by Nash, and has since become very general, Wood still continues to be nearly the first in point of merit as he is of date. It was about the end of 1726 that he began his Bath "improvements," which he carried on uninterruptedly for about twenty years, within which time he entirely changed the architectural character of the place, and conferred upon it even a degree of magnificence, at least as displayed in such parts as the Parades, the Circus, the Royal Crescent, Queen's Square and some of the public edifices, and even some of these would have been superior to what they are had they been executed entirely according to the original designs. If not altogether proof against criticism, they are at any rate free from the sneering reproach levelled against many later works of the kind, as being mere "lath and plaster;" and if Smollett has spoken of them very deprecatingly, in his novel of "Humphrey Clinker," others have been even prodigal of praise. Among these last is the author of the "Principles of Design in Architecture," who says:—"With all its faults in parts, I must reckon the Crescent, at Bath, among the finest modern buildings (1809) at this day existing in the world." And he further laments the decay of architectural taste in Bath since Wood's time. What he did, therefore, at Bath alone, would justly entitle Wood to an eminent place in the history of English architecture; and, not least of all, for the very reason which has perhaps occasioned him to be passed over with mere general notice, inasmuch as he distinguished himself rather as the founder of a system of improvement than as the author of any individual structures of importance. Still, he produced some works of the latter class which would have preserved his name from oblivion, and among them are the noble mansion of Prior Park, erected for the "Generous Allen;" that of Buckland, for Sir John Throckmorton, and the Exchange at Bristol, first opened in September 1743. This last is, if not a very large, a very handsome structure. Wood, who at that time was a justice of the peace for Somersetshire, died May 23, 1754.

NOTES AND COMMENTS.

THERE is a class of men around London who may be called earth-robbers, for they live by carrying off the surface of building sites without authority. Sometimes one of them enters into negotiations for a lease of a piece of ground that consists of good gravel and contrives to get possession; he loses no time in commencing operations, but with all the excavations there are no signs of the brickwork. There is a sudden suspension of operations, and when after more or less delay the owner gazes over the paling which is so carefully put up around the site, he discovers that his property has become a vast chasm which it will be expensive to fill up. A case that was tried in the Court of Appeal on Tuesday shows the complications to which such robberies can give rise. In August 1889 a man agreed to purchase five plots of building land at Southend, and the conveyance was signed in the following October. When he took possession he discovered that immediately after his offer was accepted about four hundred cartloads of soil had been removed. He brought an action against the owner (to whom also the removal was a surprise) for negligence in not keeping the grounds in their original state, and a jury awarded him 75*l*. The owner applied for a new trial on Tuesday, but was not successful. The damages were, however, reduced to 50*l*. The Court held that on the signature of the contract for sale the defendant became a trustee for the plaintiff of the property, and he ought not to have allowed the soil to be removed without the plaintiff's consent. "It had been argued," said Lord COLERIDGE, "that under the circumstances no care was necessary on the part of the defendant, but he was undoubtedly bound to take reasonable care to preserve the property in the state in which it was, and to take no care was not reasonable." It was further argued that even if the plaintiff had a remedy against the defendant in respect of the deterioration of the property, he waived his right to any such remedy when he executed the conveyance. That, no doubt, would be so in some cases, but when, as in the present case, neither party knew what had happened to the property, or was aware of the deterioration, it was impossible to say that the execution of the conveyance was a waiver of the plaintiff's rights. The decision of the Court in the case was fair and reasonable, but is nothing to be done to punish those who carried off the soil and thus set two honest men at loggerheads?

THE Luxembourg Gallery in Paris is now as well arranged as it is possible for a place to be which is subject to periodical transformations. Every visitor will be glad to welcome the beautiful examples of medals, plaques and enamels which have been introduced in the sculpture gallery. It would, however, be more satisfactory if all those objects, which are on a small scale, were separated from the large works in bronze and marble, which seem to oppress the tiny new-comers. The most startling innovation among the pictures is the appearance of EDOUARD MANET'S representation of some brazen VENUS of the Batignolles. This work, when it was first sent to the Salon in the days of the Empire, was rejected; but it appeared in an exhibition of rejected works, and then, like the clarion of HERNANI, it appealed to all the young revolutionaries in art and literature. M. ZOLA saw in it a revelation of that realism which he was afterwards to expound. There were writers also who were unable to discover one trace of skilful draughtsmanship or faithful colour. As a work of art it would be out of place among a collection of the worst pictures of the gallery. It seems to be little more than a sketch of a figure which is covered with the first coat of paint, and which subsequently might be made to resemble flesh. The picture was forced into the Luxembourg, in spite of rules and regulations, by the steadfastness of MANET'S friends. They were eager to see a production which, if valueless as a work of art, was still notorious as the representative of the war against grace and beauty, set up prominently at the public expense, and they have succeeded. High officials in France are squeezable, and will sacrifice much to avoid collisions with any sort of force. MANET'S friends knew this, and hence the picture which originally captivated ignorance now becomes a manifestation of the weakness of French Governments.

IN spite of all its defects, or it may be in virtue of them, this year's Salon has been financially successful. It appears that the money received for admission has amounted to 315,000 francs, or 77,000 francs in excess of the sum paid in 1890. In 1889 the receipts were only 189,000, owing to the rivalry of the International Exhibition. From the returns, it would appear that little was lost through the second exhibition in the Champ de Mars. Everyone who visited the more remote show was sure to have seen the Salon, but it does not follow that all those who paid a franc in the Champs Elysées felt they were under an obligation to patronise the new show. An *entrepreneur* looking at the vacant spaces in all the galleries of the building on the Champ de Mars could hardly refrain from concluding that, as a speculation, there must be losses attending the venture of the reformers.

THE use of wells as a source of water supply is becoming so general in many parts of the country as to give importance to the decisions in the action brought by the Tendring Hundred Waterworks Company against Messrs. TREE, RODWELL & Co., brewers. In 1886 the company, that was formed to supply 4,000 inhabitants in Essex with water, purchased a piece of ground from the defendants in which to sink a well that was to yield 48,000 gallons daily. It was stipulated that the defendants were not to sink any well between the railway and the road. But recently a well was sunk beneath the road and the river, and it was anticipated that in consequence the water company's supply would be diminished, besides being affected by the incoming of salt or brackish water. An application was accordingly made for an injunction to restrain the brewers from doing anything that would lessen the water company's supply or be prejudicial to its purity. But a judge cannot be expected to yield to panic, and Mr. JUSTICE HENN COLLINS refused the injunction. An application was accordingly made before Mr. JUSTICE DENMAN and Mr. JUSTICE WILLS, but without bringing any change in the circumstances of the case. Their lordships held there was nothing in the deed to prevent the defendants from sinking a well on their own land. There was only a stipulation not to do so within a certain limited area, which left them free as to the rest. Nor was there any legal ground on which they were precluded from endeavouring to obtain a supply of water on their own land. The mere apprehension that the effect might possibly, by letting in brackish water, injure the plaintiffs' supply of pure water, was not sufficient to preclude them. The defendants had as great an interest as the plaintiffs in the purity of the supply. It was not necessary to show an utter impossibility of any injury; it was enough that it appeared improbable, and it was not a case for an injunction. The directors of water companies, if they anticipate that wells may be sunk in the vicinity of their property, will have to take more general precautions than were adopted in the Tendring case. It should also be remembered that when a supply is underground all the operations are invisible, and it is no easy matter to convince judges that the conditions of affecting causes correspond with those which are visible in supplies drawn from rivers, streams and gathering grounds.

THE ruins of the Cour des Comptes on the Quai d'Orsay, in Paris, have so long amazed natives and foreigners, it is only natural to assume that they are destined to go on decaying until in some remote period when there will be an energetic Government that will make short work of them. It appears, however, that a new treaty has been entered into which concerns the ruins. The Ministers, it is said, have agreed to hand over the remains of the buildings to the Union Centrale des Arts Décoratifs. The conditions are that the Union will expend a sum estimated at 3,170,000 francs in converting the ruins into a museum, which, with all the collections, will become national property at the end of fifteen years. The site is not adapted for a museum of industrial art, as the men who will make use of the collections are to be found on the opposite side of the city. But we suppose something must be sacrificed to get rid of an eyesore. If the ruins can be converted into useful buildings much will be gained; but as similar arrangements have been entered into from time to time during the past dozen years, the Parisians are likely to be sceptical until they see the new museum opened.

NEW WELSH PRESBYTERIAN CHURCH, RUTHIN.

THE new Welsh Presbyterian Church and schoolroom just completed occupies a commanding site in Well Street, Ruthin, and was formally opened on April 24. The buildings are constructed of limestone, with Denbigh stone dressings. The front portion of the church is circular on plan, having a radii of 27 feet, and measuring internally 55 feet by 54 feet. Accommodation is provided for 550 persons. The sittings are arranged in a circular-gallery form, with stepped aisles leading to the body sittings. The schoolroom is 41 feet 6 inches by 24 feet, and is at the rear of the church, having minister's vestry, lavatory and conveniences adjoining. A large room, 54 feet by 24 feet, forms an upper schoolroom over. The church is lighted by the "Stott-Thorp" patent coronas; heated by Messrs. MINSHULL & Co., of Oswestry. The architect is Mr. T. G. WILLIAMS, 3 Cable Street, Liverpool.

BREWERY TAP FOR CITY OF LONDON BREWERY COMPANY.

ARTIST'S FEES.

A CASE was lately tried in the Scotch Courts before Lord Stormonth Darling. It was an action by William Small Black, artist, Edinburgh, against John Watson, of Earnock House, near Hamilton, Lanarkshire, for payment of balance of 715*l.*, said to be due in respect of his designing and executing for the defender a large allegorical oil-painting and three small ones for the ceiling of his drawing-room at Earnock House, and decorating the wall-panels and generally superintending the colouring of the room. The defence was that the limit of the cost for the work was 450*l.*, and, to save further litigation, 220*l.* was tendered, which, added to 230*l.* paid to account, made 450*l.*

Mr. Black was the first witness. He said he was an artist and designer, and that in consequence of a letter he received in May 1890 from Mr. Grieve, of the Waterloo Hotel, he went down to Earnock to see Mr. Watson about the decoration of the drawing-room. Mr. Watson impressed on him that he wanted a very fine piece of work, and, after consultation, asked him what the work would cost. Witness said that work of this kind was now very rare in Scotland, and the price could not be fixed. He went down to Earnock and began his work about June 12, and stayed there until September 12, devoting himself entirely to this work. Sometimes he worked nine hours a day, sometimes ten, and sometimes eleven hours a day. The oil-painting on the ceiling was worked upon French ceiling canvas. The sketch design occupied him several days in preparation, and the human figures were drawn and painted from living models which he brought from Edinburgh. He left Earnock on September 12, and was not allowed to go back again till November 19, after which, on account of the weather, the work was carried on under very disadvantageous circumstances. The work was finished on February 2, 1891, and after that he rendered an account to the defender's agents amounting to 945*l.*, of which 205*l.* was outlay and expenses. Mr. Watson, at an interview on September 6, said:—"I will give you a fair price, a good price, but not a fancy price." Witness replied that that was all he wanted.

Cross-examined, Mr. Black said that no parts, either in the ceiling or in the panels, were copied. He followed the style of Louis XVI., but the design was original. It was false to say that at the interview of September 6 witness said to Mr. Watson that the cost would be more than he had thought. What he said was that, so far as he could see, it would not be a penny less than 500*l.* or thereby. The only thing fixed at the interview was that the price should be a fair price, a good price, but not a fancy price. The sum now claimed was not a fancy price.

Professor Baldwin Brown said that on June 5 last he, along with several other artists, visited Earnock House in order to examine the paintings and decorations in the drawing-room. He examined them thoroughly, and, as a whole, the work produced an extremely good impression upon him. He thought it was thoroughly artistic and carried out in a very workmanlike way. The design seemed to be suitable and in accordance with the traditions of that kind of work. It would hold its place very well with similar modern work. Witness would call it artist's work, as distinguished from the work of a mere journeyman painter. Work of this kind was very rare in Scotland, and, in the opinion of witness, was a credit to the Scottish school.

Cross-examined: The work, strictly speaking, was Louis XV. There were, as witness knew, a great number of decorators in Paris who did decorative work, but he thought that this ceiling painting was above that class of work. The scale of the centre-piece seemed perfectly suitable. *Q.* What do you think of the aerial perspective? *A.* The general effect one looks for is there. *Q.* Was it not rather crude? *A.* No, it was crisp without being crude.

Mr. J. Lawton Wingate, R.S.A., said that he had visited Earnock House. He was very much delighted with the work and with the fact that it should have been executed by an Edinburgh painter. Mr. Black's account of 900 guineas was, witness thought, a fair and reasonable price, not very much in Mr. Black's favour. Mr. Watson had got a beautiful room for a very moderate price.

Mr. Robert Macgregor, R.S.A., who had also visited Earnock House on June 5, said that Mr. Black's work struck him as being very fine in colour and composition.

Mr. Robert Alexander, R.S.A., characterised the work, the colouring and the design as good.

Mr. Robert Purvis Bell corroborated.

Mr. Thomas Bonar, painter and decorator, Edinburgh, said that he had made decoration his special study. He visited Earnock House on June 5 and saw Mr. Black's work, which he thought most artistic and successful. With few exceptions, it was the best specimen of the work he had seen in Scotland. The work, to his mind, was surprisingly quickly done. He formed a proximate idea of what the price would be, and thought that 1,000*l.* was a moderate figure. Cross-examined: The work done at Earnock was so unusual that he would not estimate for it. The flowers might stand for pictures, and in this sense were superior to the work usually done by foreign decorators. Mr. Bonar said that he had frequently refused to undertake such work because he did not know where to get a man qualified to carry the designs into execution. This case had brought the matter to the front, and he was glad to know that men were now to be had for the work, of whom the pursuer was at the head.

Mr. W. S. Cumming, artist, Edinburgh, gave it as his opinion that 900 guineas was a moderate price for the work done by the pursuer at Earnock House.

Mr. John Grieve, of the Waterloo Hotel, deposed that at the meeting between the parties no estimate of the price was given.

Mr. Watson in his evidence stated that it was on the suggestion of Mr. Grieve, of the Waterloo Hotel, that he decided to get his drawing-room decorated. Mr. Grieve mentioned the name of Mr. Black, and in an interview with Mr. Black, Mr. Black informed him that it would cost about 300*l.* He thought that a large sum, and told him so; but agreed that Mr. Black should go on with the job. Had he known it would cost much more he would never have sanctioned it. After the work had been partly executed, Mr. Black wished a payment to account. He said he was doing more work than he expected, and must have 500*l.* for the job. He expressed his willingness to go the length of 350*l.*, but Mr. Black said he would strike 50*l.* off the 500*l.* He gave him a payment to account of 150*l.*, and on leaving for the Continent in September left instructions with his local agent to square up with Mr. Black on the lines of witness's understanding of the contract. In February he received the pursuer's account for 900 guineas.

Thomas Ciceri, fine art dealer, Edinburgh, said that he had large experience in artistic work. He had carefully examined the work of Mr. Black in the drawing-room at Earnock, and his estimate of the cost was 383*l.*, the value of the panels varying from 35*l.* to 7*l.*

Cross-examined, he said he would not yield to Robert Macgregor, James Lawton Wingate or Robert Alexander as a judge of this class of work. Their work was entirely different, and they had no experience of that done by Mr. Black.

Other witnesses were examined to show that the price was excessive.

Lord Stormonth Darling, in giving judgment on Saturday, stated that between the middle of June 1890 and the beginning of February 1891 the pursuer, on the employment of the defender, decorated the ceiling and walls of a large drawing-room at Earnock House, and he now claimed a fee of 900 guineas for the work. The defence was twofold—(1) that the pursuer agreed to do the work for 450*l.*; and (2) that the sum claimed was excessive. The defence of agreement had not, in his lordship's opinion, been made out. Admittedly, there was no agreement to begin with, and the conversation which took place in September, when a payment to account was made, did not come to more than this, that the plaintiff named 500*l.* as

the probable cost, and said something not very definite about making a deduction of 50*l.* But the defendant did not agree to this, and the conversation ended without any terms being arranged. His lordship was therefore left to fix a *quantum meruit* for work of a kind which was rare, for which, therefore, it was very difficult to find a standard, and about the value of which opinions differed very widely. In fixing a sum his lordship was simply exercising the functions of a jury, and he was not required to state his reasons for coming to the conclusion that a sum of 600 guineas was reasonable remuneration for the work. But it might be convenient that he should indicate the leading considerations which had led him to that result. It was clear, he thought, that the defendant started with too low an idea of the probable cost. He had formed the impression (on no data of any kind and without skilled advice) that it ought not to exceed 300*l.* But none of his witnesses put it so low as that, and some of them estimated the value of the work at very nearly 500*l.* The plaintiff's witnesses to value, on the other hand, said that the sum claimed was in their opinion reasonable—some of them even said that it might fairly have been higher, but none of them, except Mr. Bonar and Mr. Walter Crane, gave any data for their opinion. If his lordship had merely to choose between these conflicting statements, he should probably have looked for the truth somewhere between the extremes on either side. But it seemed to him that a safer guide was to be found in the indication—rough, no doubt, and not obligatory, but still most important—which the plaintiff himself gave in the conversation to which his lordship had alluded, in the month of September, when the greater part of the work had been done. He knew then the nature of the work, and the probable time it required to complete it. After giving such an indication, his lordship did not think he was entitled to go so far as nearly to double the amount. On the other hand, his lordship could not throw out of view that he was fairly entitled to expect that he would be allowed to resume his work after the immediate cause of its cessation (a marriage in the defendant's family) had gone by. If that had been done, he could have finished before the winter. As it was, he was prevented by the defendant from getting access again to the room till the middle of November, by which time the state of the light made the work much longer and more difficult. For that reason he thought he was entitled to a substantial addition to the sum which he had indicated in the early part of September. His lordship held it proved, notwithstanding the adverse criticisms of some of the defendant's witnesses, that the plaintiff's work was of a high order of excellence, and that, viewing it simply on its merits, the sum which he had fixed was by no means an excessive price. Had the plaintiff been a man of more established reputation in this branch of art it was probable that he might fairly have been entitled to claim a higher price for it. But he was a young man who never did so important a piece of work before, and, at all events, as his lordship had said, he ought not even to have indicated a sum of 500*l.* when three-fourths of the work was done, if he meant at the end to make a claim of 945*l.* His lordship found that the plaintiff executed the work in question on the employment of the defendant without any agreement being made as to price, and that he was entitled to payment of the fair value of the work done, and found, further, that the sum of 630*l.* was the fair value of the work, and that 230*l.* had been paid to account. He ordained the defendant to make payment of 400*l.*, with interest, and found the plaintiff entitled to expenses subject to a large modification.

Counsel for the plaintiff—Mr. M'Kechnie and Mr. Kennedy. Agent—J. D. Macaulay, S.S.C.

Counsel for the defendant—Mr. Jameson and Mr. Dewar. Agents—Simpson & Marwick, W.S.

THE BRITISH SCHOOL AT ATHENS.

ON Friday Lord Justice Bowen presided at the annual meeting, held in Albemarle Street, in support of the British School at Athens.

The Hon. Secretary read the annual report, which, after referring to the excavation of the theatre at Megalopolis, gave the names of the students admitted or readmitted in the school in the course of the session, and stated that Miss Eugenie Sellers, who was well known in London as a lecturer on archæology, had been admitted as the first lady student. Messrs. Schultz and Barnsley, who had returned to England in December, had continued during the past session their valuable work on Byzantine architecture. They might possibly return to Greece in the autumn. The report concluded by referring to the finances of the school, and recommending a large increase in the number of annual subscribers, as there was no adequate endowment.

The Chairman, in moving the adoption of the report, said:—Ladies and Gentlemen,—We may venture, I think, this afternoon to indulge in the belief that the fortunes of the British School at Athens are steadily, although slowly, progressing. I recollect that when, some few years ago, that distinguished representative of English scholarship, Professor Jebb, first brought before the world the plan of such an institution he indicated two sources from which its friends might reasonably expect support. One was the kindness of our Universities. It cannot be unnatural to hope that they will extend confidence and sympathy to this work. The colleges of the United States have done much for their American institution, and the Universities of Great Britain and Ireland will, I am sure, sooner or later feel themselves directly concerned in the welfare of the English Athenian School. Till a somewhat late period it was on the side of archæology and local investigation that Greek scholarship amongst us was weakest. And it seems to be generally conceded that the teaching of our Universities and public schools still requires much strengthening in this direction. To the educational bodies of the future it will seem an essential qualification for a Greek professor or lecturer that he should have studied the language, literature, history and art of Greece by the light of modern archæology. The best context by which to read a national literature is that furnished by the skies under which it flourishes and the soil from which it sprang. To the absence of accurate acquaintance with this natural context may be attributed something of the narrowness of the grooves in which Greek scholarship amongst us seemed fated, some little time ago, to run. But the borders of English scholarship have been broadening. The Hellenic Society and the British School at Athens are two welcome products of the new movement. And the spade is revolutionising the Classical curriculum as completely as thirty or forty years ago, under Todleben, it revolutionised the science of war. Out of the funds of our English Universities one can readily understand that it is difficult to ask for much aid. But though the hands of the University authorities at Oxford and Cambridge are somewhat tied, the individual colleges and their governing bodies have ample power of encouraging and assisting the British School at Athens. Among the academical events of the last year there is one which deserves special mention this afternoon, as affording an instalment of generous sympathy from the side of one of our Universities which we may hail as an auspicious omen. In order to enable Mr. Ernest Gardner to continue his services to the cause of archæology and of classical study as director of the Athens School in the chair first filled by Mr. Penrose, Caius College has re-elected Mr. Gardner to a Fellowship for a renewed term of three years. Is it too much to trust that other colleges at Oxford and at Cambridge will come to the rescue also by treating work done or to be done at Athens for the British School as worthy of special encouragement and privileges? Among those present to-day there must be several who have the means of securing that this point of view shall be seriously considered and weighed by the common rooms of Oxford and of Cambridge. But there is another source from which succour might reasonably be expected, namely, the generous sympathy and assistance of some of those lovers of learning and of art of whom in England there are so many. Possibly those who are always ready to further a good cause will accept the assurance of English scholars, such as some of those I see around me, that the British School at Athens is an object well deserving of their attention and their goodwill. France, Germany and America are even ahead of us in what they have done. Their schools at Athens started in front of yours and rest on a more solid pecuniary foundation; yet it is this year a pleasure to be able confidently to say that the English work at Athens has begun to make itself felt, and is likely to continue to do so. The completion of the excavations at Megalopolis, in particular, furnishes us with a matter for just congratulation. If fortune is propitious we may regard these explorations as the first of a series of happy enterprises over which your director will, I hope, be called upon to preside. To all whose personal tastes lead them in the direction of similar adventures the British School at Athens affords an invaluable basis of operations. To have the assistance, upon the spot, of the wisest advice, of the best local experience, and the best books is an advantage not to be despised. I hoped to see this afternoon Sir Charles Newton among us, with whom all such enterprises as ours are so intimately connected. I trust that his absence is not due to any failure in his restoration to health and strength. I am sure his name will never be forgotten by the friends of such an undertaking as this. I will not detain you by further observations, but will conclude what I have to say by at once moving the adoption of the report.

Lord Lingen seconded the adoption of the report, and observed that a new and living interest would be given to the old classical studies by more intimate acquaintance with the birthplaces of the noble literatures of Greece and Rome. He hoped that as a British School had been established at Athens, other schools would be set up at the great centres of antiquity in the way in which the French had established a school of painting at Rome. The report was unanimously adopted.

Mr. Ernest Gardner then read the report of his work during

the last year, and expressed his gratitude to Mr. Penrose for so kindly taking his place at Athens during his absence last year at Cambridge, and to his college for re-electing him to a Fellowship. He then gave an account of the lectures and the work of excavation which had been going on. They had been able to continue the work at the theatre at Megalopolis, and the decision of the committee to continue the excavations had produced very satisfactory results. After giving a detailed account of the work accomplished, Mr. Gardner expressed the belief that there still remained valuable discoveries to be made, and he was glad to say that any misunderstanding which might have existed between Dr. Dörpfeld and himself and colleagues had been removed, and that they were now all working together in harmony. As to the difference of opinion on matters of detail between Dr. Dörpfeld and the British School he would ask for a suspension of judgment until a later date.

Mr. Penrose then gave a short account of his work at Athens, which was mainly devoted to the site of Megalopolis.

Professor Lewis Campbell, in moving the election of officers of the school, said that he had visited Athens this spring, and was glad to bear testimony, not only to the good work done by the school to its own students, but also to the kindness which Mr. Gardner and the members of the school extended to all visitors who had any interest in classical studies. He had also realised the admirable work which was being done at Megalopolis. For himself, he could not dig, but for such a cause he should not be ashamed to beg.

Dr. Perry, in seconding the motion, expressed regret that this country should be so far behind Continental countries in the maintenance of such work as was now being carried on by the British School.

Professor Jebb moved a vote of thanks to Lord Justice Bowen, which was seconded by Sir George Bowen.

DUNDEE INSTITUTE OF ARCHITECTS.

THE annual meeting of the Dundee Institute of Architecture, Science and Art was held last week, Mr. Charles Ower, C.E., presiding.

Mr. Henderson, the secretary, submitted the annual report, showing that the membership last session consisted of 49 members, 152 associates, and 7 honorary members. This year's roll contained the names of 50 members, 168 associates, and 8 honorary members. The council put on record its sense of the Institute's loss caused by the removal by death of such men as Captain Adams and Mr. W. J. Small from the associate roll, and of Professor Carnelly and Mr. Patrick Allan Fraser, of Hospitalfield, from the roll of honorary members. Of Mr. Fraser's courtesy and kindness and devotion to art the Institute had had rich experience; and of Professor Carnelly's devotion to science, in its bearing upon the health condition of life, the Institute had received lasting proofs. The council had seen fit to enter upon some experimental work by way of providing a library and consultation-room and adding to the attraction of the conversazione. Extra prizes to competitors and additional advertising of the lectures accounted for the remainder of the increased expenditure. The rest of the report dealt with the lectures, excursions and competitions which had taken place. The treasurer, Mr. George A. Harris, submitted the accounts. They had commenced the year with a balance of 60*l.* 5*s.*, and the total income had amounted to 131*l.* 5*s.*, while the expenditure had reached 89*l.* 13*s.* 8*d.*, leaving a balance in hand of 41*l.* 11*s.* 4*d.* The sum of 14*l.* 3*s.* 6*d.* had been paid in prizes, as compared with 5*l.* last year. The report was unanimously approved.

The President drew attention to the proposal that the branch affiliate with the Royal Institute of British Architects, which was, as they were aware, the principal body in this country representing architects and architecture. It had instituted examinations, and by other means was endeavouring to raise the status of the architectural profession throughout the country, and part of their programme was to endeavour to affiliate or ally itself with societies whose rules were in such a state that they could be conformed to the charters of the Royal Institute. They had had a long correspondence with the secretary of the Royal Institute, and one of the first points he had noted was the form of application to membership and the form of declaration which had to be taken. The latter provided that the member signing it was engaged in the practice of architecture, and, in consideration of his being elected to membership, to promise and agree that he would not accept any trade or other discounts or illicit or surreptitious commissions or allowances in connection with any works the execution of which he might be engaged to superintend, or with any other professional business which might be entrusted to him. That, Mr. Ower said, looked on the face of it a most objectionable thing. It appeared to be a most objectionable thing to ask a body of honourable men to sign a declaration like that; but they found that the declaration had been signed by every architect of any eminence in this country, and while to an honourable man it made no difference, it acted as a check to those who were not so honourable. In connection with the election of Associates, the rules had been amended so that ladies should be admitted, and not be dependent on gentlemen for tickets to the meetings of the Institute.

Ex-Bailie M'Culloch asked if this question had been raised on the initiative of the Dundee Institute.

The President said his impression was that it arose from a suggestion made by the Royal Institute.

Bailie M'Culloch remarked that the Royal Institute had been the chief opponents of the Registration Bill. They had boasted in their opposition that they represented the architects of the country, and if they managed to get the assistance of such Institutes as that of Dundee, it would give them still greater standing. The Dundee Institute as a Society had petitioned in favour of the Registration Bill year after year, and to Bailie M'Culloch's mind it was a very desirable measure. Architects had taken great interest in the plumbers' registration, and it was really very absurd, after the interest they had evinced in that subject, to imagine that they were satisfying themselves by remaining an open body. Another point he should like to touch on was that in London surveyors were separated from architects, and were not included in the Institute. In Dundee they had no separate body, and therefore, before joining with the Institute, they should see that they did not hamper themselves in this respect.

Mr. J. J. Henderson said there was a difference between plumbers and architects. Plumbers went in for voluntary registration, but architects wanted Parliamentary registration. He further mentioned that if they were not satisfied with their alliance with the Royal Institute they could terminate their connection on three months' notice.

The Chairman moved that the proposal to affiliate with the Royal Institute of British Architects be approved.

Mr. W. Mackison seconded, and said he was satisfied that by affiliating they would receive much benefit. It might, among other things, be an outlet for young men getting situations in London.

The motion was carried.

ST. MARTIN'S CHURCH, COLCHESTER.

AT the monthly meeting of the Colchester Town Council the following report was presented by the Museum, Muniment and Library Committee:—

In accordance with the resolution of the Town Council, the committee have carefully considered the subject of the restoration of the parish church of St. Martin, Colchester. The committee have abstained from going fully into the legal aspects of the question, and how far the by-laws of the borough affect the liability of the church authorities to submit plans of proposed alterations to the Urban Sanitary Authority previous to their being carried out; and into the intricate ecclesiastical laws bearing on the general question of church buildings.

The church of St. Martin has always had much interest for Colchester people, irrespective of their religious views, from the historic associations connected with it, and the picturesque appearance which the building has until recently presented. The tower, built for the most part of Roman tiles, was a good deal injured by the cannon of the besiegers in 1648, and remains in about the same state as then. Some amount of regret was caused by the destruction of the ivy which had grown in beautiful masses on the tower, and this has made many persons very sensitive as to any fresh proposals for altering the building. The church is of the decorated period of Gothic architecture, with a very fine timber roof. The font is of Caen stone, elaborately carved, and interesting from there being embedded in it several bullets fired in the siege of Colchester.

The alterations proposed comprise the following:—General repairs to the walls and roof. To effect the former the mural tablets have been removed, but the rector (who has been communicated with by some members of the committee) has given an assurance that they will all be replaced on the walls of the nave or tower. The floor of the chancel is being raised to the extent of about 2 feet at the east end by means of steps, four in number, of the whole width of the chancel. The effect of this is to considerably alter the appearance of the interior from its original state. Although the seats of the sedilia have been raised, they are now very close to the floor, and could not be suitably used for their intended purpose if so required. The sill of a doorway on the north side is about a foot below the floor, owing to the latter being raised. There are to be built a choir vestry and organ chamber outside the church, and communicating there by two arches, one to the east end of the north aisle, the other by opening out an old arch into the chancel. By removing a portion of the wall a fine specimen of a fifteenth-century window will be taken out, and it is understood it will be inserted in the wall of the new vestry. The

ancient simplicity of this part of the church will by these changes be lost. As regards the tower, the rector has undertaken that no change will be made in it beyond making it safe, nor will the font be in any way interfered with; and, should the Council desire, permission will be given for a suitable tablet to be placed in the tower, mentioning the fact of the damage occasioned to the structure and font during the siege of Colchester, for the information of visitors. The rood staircase is to be opened out, a few other minor changes made, but the "squint" will not be altered.

The work is being carried out by the rector and churchwardens. There does not appear to be any town or parish committee, but funds have been raised by voluntary subscriptions and by a bazaar, to which the inhabitants of Colchester liberally contributed. The proceedings have the sanction of the bishop of the diocese, and it is stated that a faculty permitting the alterations has been granted by the ecclesiastical authority.

Having informed the Council of the present position of matters, the committee, although aware that many persons interested in the subject do not approve of what is being done in this restoration, have not seen their way to recommend the Council to take any action in the matter.

The committee have, however, in the course of their investigations considered some other points not bearing immediately on the special subject in question, and have agreed to submit the following recommendations to the Council:—(*a*) The committee are of opinion that great care should be taken to preserve the old buildings of the town, many of which contain fine woodwork and are of superior architectural merit and better construction than the modern style of house and shop-buildings. With this view they recommend the Council to revise the building by-laws, so as to permit the use of timber construction in conjunction with stone or brickwork, whether for new buildings or the repair of old structures. (*b*) The committee further recommend that an account be taken of all the mural tablets and memorials of the dead which are to be found in the various places of worship within the borough, and that such account should be placed in the archives of the town. The committee believe that the ministers of the churches and chapels would readily assist the Council to obtain a full and accurate list of all such monuments and memorials.

Mr. Marriage, in moving the adoption of the report, said they were in danger of losing some of their old and interesting houses, in which a good deal of timber was used in the construction. Since the report was issued, a fine timber-built house which had stood 500 years had been removed to make room for an inferior erection which probably would not last fifty years. Mr. Marriage alluded to the apparent inability of the architects and builders of the present day to put up picturesque and substantial buildings, and observed that they pulled down the Colchester Town Hall, which had lasted for centuries, and built a new one, which probably would not last another fifty years. He appealed to architects and builders as to whether they could not take some measures, whenever they had an opportunity, of preserving these interesting old structures. As to the second paragraph of the report monuments did disappear from the churches and chapels of the town which might be of great interest to families, and therefore it was very desirable that an account should be taken of those that now existed, so that there might be a reference to them. The report was adopted.

ARCHITECTS' FEES.

IN the Court of Queen's Bench, before Lord Coleridge and a special jury, the case of Eedle and Another *v.* Alston was heard. It was an action by a firm of architects for architects' fees and sums paid, and to quantity surveyors for quantities taken out. The plaintiffs' claim was for architects' fees, 176*l.* 11*s.*, and for surveyors of quantities, 183*l.* 19*s.* 6*d.*—total, 360*l.* 10*s.* 6*d.* The defence, in substance, was that the plaintiffs had been employed to make plans, &c., for certain work, the expense of which was not to be above 2,000*l.*, and that, in fact, it was found that it could not be done under 4,779*l.*, so that the plaintiffs' services were wholly useless to the defendant, and nothing was due to them.

Mr. E. Tindal Atkinson, Q.C., and Mr. Crispe were for the plaintiffs; Mr. Winch, Q.C., and Mr. Haigh were for the defendant.

The plaintiffs carry on business near London Bridge, and on October 15, 1889, the defendant, occupier of the Prince of Wales Hotel, in Paddington, saw Mr. Eedle and told him he desired certain structural alterations in the house, and wished him to prepare the necessary plans, &c., which he proceeded to prepare accordingly. According to the account given by Mr. Eedle of the conversation, the defendant, who was accompanied by his son, said nothing as to the expense, or as to any limit of expense, though as they were going away the son said, "I suppose the expense will be about 2,000*l.*," to which, however, Mr. Eedle said he replied that it would cost much more, and according to him the defendant said nothing at any time as to any limitation of expense. In the correspondence, however, it appeared to be admitted that the defendant had mentioned 2,000*l.* as the amount he could afford to expend, but it was asserted that there were subsequent alterations which would greatly increase the expense. The alterations at first contemplated were only on the basement and the removal of the kitchen to the next floor, and these, it was admitted, could be done for 2,000*l.*, though the parties differed as to whether that sum was mentioned as a limit. But soon other works were suggested, and among others an alteration of the front, to which the next-door neighbour objected, and the superior landlord, whose license was necessary, and for these further plans and drawings were required. The plaintiffs prepared the plans, which had to be submitted by the defendant to the vestry and the County Council, and were not approved by the latter, and new plans were prepared, of which, according to the plaintiffs, the defendant approved, and upon these—in order to ascertain the expense—the plaintiffs employed surveyors to "take out the quantities," and the "quantities" were taken out, upon which builders made tenders for the work, the lowest of which was 4,779*l.*, on which the defendant threw up the design, but employed another architect, and did certain works to the amount he had contemplated. The plaintiffs claimed for the charges of the surveyors who had taken out the "quantities," and also claimed their commission of 3 per cent. on the estimated expense of the works done. The defendant disputed his liability to pay anything. When the nature of the case appeared,

Lord Coleridge said the plaintiffs, no doubt, were entitled to recover something, but they could not be permitted to recover by way of commission on the estimated expenditure. That was a claim which architects might consider reasonable, but which they had never been allowed to enforce. They could only in such a case recover a reasonable remuneration.

The counsel for the plaintiff assented to this.

Mr. Winch, for the defendant, said his case was that from the first he had told the plaintiff Eedle that he could only afford 2,000*l.*, and he read a letter of Mr. Eedle's admitting this, and though, no doubt, he added that there were alterations, yet the defendant was never told that the expense would be increased.

Lord Coleridge: But none of this work was done. No doubt it would be admitted that if the plans had been carried out the cost might well have been 5,000*l.*

Mr. Winch: Certainly, but all through the defendant kept saying, "Mind, you must not exceed 2,000*l.*"

Lord Coleridge: But what was the use of saying that in the face of these drawings and plans?

Mr. Winch: Your lordship is carried away by that fine drawing—the elevation, as it is called. But it never was sanctioned by defendant.

Lord Coleridge: I do not look only at that, but at the whole of the drawings and plans, which showed additional expense.

One of the jury observed that it did not appear that at that time the defendant interposed and forbade any further expense.

Lord Coleridge: No. That is just what occurred to me. I am afraid, Mr. Winch, your client "had a taste!" and he must pay—I do not say all that the plaintiffs claim, but what the jury may consider reasonable. His lordship read a passage in one of the defendant's letters to Mr. Eedle:—"I leave it in your hands to do what is right and proper, only get the estimates as soon as possible."

Evidence having been heard on each side,

Lord Coleridge, in summing up the case to the jury, told them that the plaintiffs were clearly entitled to recover the surveyor's charges, which were reasonable. As to the architect's own charges, he had already said that he objected on principle to a percentage on an amount not expended; and the question would be what was a reasonable amount. But in some cases where the work was headwork and involved skill and experience, it was difficult sometimes to make a charge in any other way, and here the commission charged was small, and at all events the amount charged did not appear to be unreasonable. Now, as to the defence set up, the work had been done, and apparently well done, and the defence was that it was of no use to the defendant. But he knew it was done, and done for him. He set up, indeed, that there was an agreement that the expense should not exceed 2,000*l.*—that is, that there was a guarantee to that effect, for if it did not come to that, it was nothing. And in this case, as in the recent case of Colonel North, though there was a memorandum, there was no mention of the amount. The plaintiff, Mr. Eedle, denied having given any estimate, and it would have been impossible and idle to have attempted to do so until the plans were settled as to what the work would be. The plans were shown to the defendant from time to time, and there were the letters, which appeared conclusive. In one of them, from the defendant to the plaintiff in answer to a letter sending the plans approved, he wrote, "I leave the matter in

your hands," &c. Nor would the defendant swear that he ever asked the architect if the expense would exceed 2,000*l.* Ultimately, no doubt, he threw up the design, and, like a sensible man, resolved not to exceed the expense he could afford. But why had he let the other architect go on so long? Why had he not stopped him at once when he saw the expense would exceed 2,000*l.*? The reasonableness of the charges was not disputed, the only question raised was whether anything was due.

The jury consulted for a few minutes, and then appeared to hesitate as to whether the surveyor's charges should be additional to the architect's, or rather not included in them; and one juror pointed out that 360*l.* was 8 per cent. upon 4,779*l.*

Lord Coleridge said the reasonableness of the charges was really not disputed. The sole question was whether the special bargain had been made—that the expense should not exceed 2,000*l.*

The jury still hesitated, some of them appearing to think that the surveyor's charges ought not to be paid in addition to the architect's.

Lord Coleridge: The defendant himself does not dispute that, if he owes anything, he owes 360*l.* 10*s.* 6*d.*

The jury returned a verdict for the plaintiff for the full amount claimed—360*l.* 10*s.* 6*d.*

THE LONDON AND BRIGHTON RAILWAY BRIDGES.

THE following report by Sir John Fowler, C.E., is appended to Major-General Hutchinson's report to the Board of Trade on the accident that occurred in May last at the Portland Road (Norwood) Bridge of the London, Brighton and South Coast Railway, which, with correspondence relative thereto, has already been published:—

2 Queen Square Place, Queen Anne's Mansions,
Westminster, S.W.: June 17.

Gentlemen,—Mr. Banister has supplied me with full information respecting the cast-iron bridges on the Brighton Railway and its branches. The total number is 171, of very varied size and character. I have not thought it necessary to make rolling-load tests personally, partly because such tests, if properly done, would involve a long time and much interference with traffic, but chiefly because I find such tests have been carefully made from time to time by your engineers, and the deflections observed. These tests, with deflections, have been supplied to me, and I find they agree with the results of my calculations of what the deflections ought to be. I have, however, personally inspected the Victoria Bridge over the Thames, the Ouse Viaduct, the Shoreham Viaduct, and several typical bridges. The Victoria Bridge is a strong and good bridge in every respect, and will be so for very many years. The timber of the permanent-way now requires renewal, and this is being done. Being an arch-bridge, passing trains cause a movement which may be termed "vibration" as distinguished from the movement or deflection of an ordinary girder bridge, which has less vibration, although probably more movement. No anxiety whatever need be felt about the Victoria Bridge. I walked over the ground of the site of the Ouse Viaduct and examined every pier and arch. I found this fine structure, which is exceptionally strong, in excellent condition. The few bricks in special places which have been affected by weather have been promptly replaced by new bricks set in cement. This work of reparation is very trifling, but is evidently never neglected, and the viaduct is maintained in the same sound state of efficiency as on the day of its completion. The Shoreham Viaduct consists of 36 spans of 30 feet each, with cast-iron girders resting on timber piers. The time has arrived when this viaduct would require renewal in a few years by substituting iron cylinders for timber piers, and wrought-iron girders for cast-iron. I recommend, however, that this renewal be carried out as soon as arrangements can be made, and whilst the viaduct is in a perfectly safe state. Being a work of some magnitude it will occupy longer time than any other work of renewal, and I think it will be more convenient and economical to construct a new viaduct alongside the old one, and thus avoid all interference with traffic, and afterwards connect the ends with the old line by short curves. Besides the Shoreham Viaduct there are about twenty bridges which, in my opinion, should be reconstructed by the substitution of wrought-iron (or, preferably, steel) or cast-iron during the next twelve months, or sooner if possible, and about sixty other bridges should then be reconstructed. Before any actual steps are taken with reference to the works of any bridge I advise a very early conference with Mr. Banister, the manager of the traffic department, myself and Sir Benjamin Baker, with a view to settle the best order to be taken with the work, having reference to traffic convenience, season of the year and other considerations, it being understood that all the eighty or eighty-one bridges are to be reconstructed in the shortest time reasonably possible and not exceeding two to three years from the present date.

The advice given in this report for the gradual reconstruction of the bridges is based upon considerations affecting the vast majority of railways in the kingdom, viz. the great increase in the weight of modern locomotives and the superior endurance of wrought-iron or steel as compared to cast-iron when high speeds, heavier engines and consequently a greater vibratory action has to be provided for. The result of my investigation does not indicate any unusual weakness in the Brighton bridges, which are neither better nor worse in that respect than those on similar lines of railway at home or abroad.—I am, &c.,

JOHN FOWLER.

To the Directors of the London, Brighton and
South Coast Railway.

WESTMINSTER ABBEY.

(*Concluded from page* 14.)

A SOMEWHAT similar proposition, also accompanied by a ground-plan, was submitted to us by Mr. Somers Clarke, F.S.A. It differed from Mr. Pearson's plan in that it would cover the sites of Nos. 1 and 5 Old Palace Yard, in addition to those of Nos. 2, 3 and 4, and would present a frontage almost identical in line with that of those five dwelling-houses, the leading principle and greatest attraction of both schemes (that of Mr. Pearson and that of Mr. Somers Clarke) being that the new building would be actually united with the Abbey church by a covered way. This advantage was clearly explained in the following question and answer:—

"Sir H. Layard: Your plan is to have a separate building under a separate roof, but still in connection with the Abbey, that people making the tour of the church would pass through it, or into it as part of the Abbey itself?"

"Mr. Somers Clarke: Yes. The whole thing would be one continuous scene in their eyes, and could not be more incorporated." This view was also strongly urged by His Grace the Archbishop of Canterbury.

Of these two proposals, that of Mr. Pearson appears to us to be less open to the serious objection that the erection of any structure on a site cleared by the removal of the Old Palace Yard houses must inevitably have the effect of masking more or less the beautiful outlines of the chapter-house and of interrupting the view of the chapel of Henry VII. Mr. Pearson himself acknowledged the inexpediency of again concealing the chapter-house and adjacent parts of the Abbey from view, and, in order to meet the objection, he prepared a modified plan in all respects similar to the former, save that it would occupy a site 25 feet further to the south, and would therefore, he considered, be less open to criticism. In this opinion we agree, and we should not hesitate to recommend the adoption of such treatment of the site at Poets' Corner, if it should be considered that no better place for the required monumental chapel could be found.

It remains for us to consider—

4. *The Utilisation of a Vacant Space Adjoining and Communicating with the South Side of the Great Cloisters.*

In dealing with the proposed adoption of a site on the south side of the great cloisters the details of the ground plan of the Abbey precincts must be kept in view. The boundary of the great cloisters on the south is denoted by a double line indicating the position of a wall of greater thickness than that of others in the immediate vicinity, and extending from the site of an ancient tower near the entrance of the deanery premises to the northern extremity of the dark cloister. This wall, which is more than 150 feet in length, was, in fact, a party wall, forming at the same time the southern boundary of the great cloisters and the northern limit of the ancient refectory of the Abbey, "a magnificent chamber, of which the lower arcades were of the time of the Confessor or of the first Norman kings, the upper storey which contained the hall itself being of the time of Edward III." It is pierced by a wide doorway, which exactly faces the west walk of the great cloisters, and is directly opposite to a corresponding entrance opening into the nave of the church, so that the west walk forms a vista from the refectory site to the interior of the Abbey. The wall is in fair preservation considering its great antiquity, and rises to a height of 34 feet, being about 12 feet above the roof of the adjoining cloister. On its south face the wall is exposed for the greater part of its length, the remains of its ancient arcading and remarkable architectural features being plainly visible from the courtyard at the back of Ashburnham House; while the only structures on that side which at present interfere with its integrity are a few subordinate buildings of recent construction and no special interest or value, some of them having been erected by way of a cheap enlargement of the outbuildings of Ashburnham House, and others, which are little more than sheds, being the workshops and lumber-rooms of masons and

other workmen. In fact, the removal of a few modern brick structures on the south side of this wall would clear an area of about 130 feet long by nearly 40 feet broad. It will be seen, too, that this space or site is in the very centre or core of the ancient Abbey precincts as indicated by the dotted line enclosing them on the plan; and it may be added that not only was the refectory, which stood on this plot of ground, a building devoted to the purposes of the inmates of the Abbey, but that "it was a chamber only inferior in size and beauty to Westminster Hall." A great Council of State was held within its walls by Henry III. in 1244, a great assembly of clergy and laity by Edward I. in 1294, and various conventions of the Commons of England from time to time, notably in the reign of Edward II. for the impeachment of Piers Gaveston; and on several occasions during the reigns of Richard II., Henry IV. and Henry V. The rescue of this site sooner or later from its present prosaic purposes seems desirable, if for no other reason, for the sake of that historical continuity of which the Abbey, as a whole, is the embodiment and the symbol.

We are not unmindful that a difficulty in the way of an immediate adoption of the refectory site might be found in certain circumstances connected with the transfer in 1881 of Ashburnham House from the Dean and Chapter of the Abbey to the governing body of Westminster School, which were the result of somewhat hurried legislative action, taken in the year 1868. One effect of the erection of a chapel upon the site of the "refectory," of which the garden at the rear of Ashburnham House forms a part, might be to obscure to some extent the "ancient lights," of which the right of enjoyment is, presumably, vested in the owners of the latter building. This difficulty, as well as others which might arise from the same circumstances, need not, in our opinion, arouse alarm. It is in evidence that a structure erected on the ground, and to the height of the ancient refectory, would be "far enough from Ashburnham House not to interfere with the light, except in the case of one classroom," and any such disturbance would be a matter to be adjusted, if necessary, by the payment of a very moderate sum as compensation. It may be remarked that the only purpose to which the garden has been put by the authorities of the school has up to the present been the construction of a latrine at one end of it; it is not used by the school even as a playground; the grass and weeds which cover it are untrodden, and there would seem to be some doubt as to the exact extent of the appurtenances which passed to the governing body with Ashburnham House itself under the Act of 1868.

With regard to the architectural possibilities connected with the adoption of the refectory site, we have had the advantage of the advice of Mr. Pearson, who, having fully considered the suggestion, gave it as his opinion that it was quite possible to erect "a charming building" on that site, and that "the site would lend itself very readily to such a purpose."

Mr. Pearson proposed "to add a row of columns along the north and south sides of the building and to groin over the whole space in stone. The arcading which exists in the north wall could be preserved, and the difficulty which has been suggested of supporting any roof on this wall could be got over by building columns in advance of the wall, and then, at the level of the top of the Norman arcade, turning arches over the intervals, which would carry the walls; these walls, together with the columns, would form abutments for the arches and groining above, and recesses would by this treatment be formed, in which the existing windows of the upper part of the north wall of the refectory would come. The arches, which would be pointed, and which might form a handsome and interesting feature of the suggested monumental chapel, would reach up to the sills of the windows, but they would not go above them. The other arches would run from west to east, and extend up to 30 feet in height, making a sort of aisle, as it were.

"In that way the antiquarian beauties and value of the old wall would be entirely preserved, and there would still be room for monuments for a long time to come. On the opposite side the same treatment would be carried out, and there would be ample space in the nature of recesses for monuments."

Mr. Pearson prepared for us a perspective sketch of the inside of such a chapel, showing the effect of the treatment he had suggested in the passages above quoted, and he roughly estimated the cost of such a building at about 30,000*l.*

It would seem that the area of this chapel, or annexe, if built so as to occupy the portion of the proposed site immediately available, would be little less in length than that of the chapel of Henry VII., or of St. Margaret's Church, and of a width of 37 feet, and that in such a building room would be found for national commemorations for one hundred or two hundred years to come; and it has been suggested that it might be the first instalment of a larger design for covering later on the whole extent of the refectory and Ashburnham House, should it ever be restored to the Abbey, with another cloister, of which the proposed chapel should form the northern side.

The adoption of this plan has, in our opinion, a further special merit, which is not shared by any other which has been brought before us, namely, that such a chapel as it is proposed to erect upon the refectory site would be hardly, if at all, visible from the outside, and therefore could not interfere or come into comparison with the chapel of Henry VII., the chapter-house, or any of the other older buildings. It is agreed that the additions proposed in the various other schemes submitted to us should be at once in harmony with, and subordinate to, the ancient edifice; but, however skilful the architect who might be chosen, his work must necessarily run the risk of being deemed either an insignificant appendage, or, if ambitious in its design and details, a presumptuous rival to the Abbey.

SANITARY ARRANGEMENTS ABROAD.

IN a report made to the Mayor of Philadelphia by Dr. Keyser on systems of sewerage and sewage disposal the following passages occur:—

I found in Berlin a complete set of sewers running through the city, which, uniting in larger ones called conductors, carry the great mass of sewage to the places of deposit, where machinery is erected to pump it out, as the river Spree, which is a small sluggish stream running to the city, cannot be used as a receptacle or dumping place for anything. Nothing but surface water, waste from yards, kitchen and water-closets is permitted to run into the sewers. Even to prevent the great quantity of the dirt from the ordinary dropping of the horses and wear and tear of the streets, men are continually employed gathering such waste together and depositing it in ornamental iron receptacles, which are to be seen in every square, from whence it is removed at night by carts. No bits of paper, garbage or débris of any kind are suffered to be thrown into the streets. These are collected in bags or boxes, and hauled out of the city for whatever use they can be put to. Everything, more or less, is put to some use in one way or the other. Waste as in this country is really unknown. All of the sewage matter is used for cultivation around the city. Berlin was founded on a barren sand plain, and for a long time all the fruits and vegetables were brought into the city from distant parts of the country. But since the utilisation of sewage matter the surroundings of Berlin have become magnificent fertile tracts, developing gardens producing almost everything necessary in the way of food for the inhabitants.

To make this sewage useful sewers were built in every street, large and small, according to the character of the street, and uniting into a system which carries the matter into large places or basins from which it is pumped up to give it flow into other canals or sewers running out into the country. As the whole territory around is very flat it is necessary to have stations for pumping the water up to get the required elevation to give the further flow to extend to certain distances. From these stations it runs into many canals, which are connected and can be shut off as needed. The smaller canals run throughout the country, irrigating the soil and permitting the deposit of the solid matter as it runs along. This solid matter is at times scraped out of the canals and thrown on the land, making very fertile soil.

From Berlin I went to Dresden, which I found a very clean city, with a system of sewers not as thorough, but sufficient to relieve that city for its present needs. The river Elbe running through the city, dividing the old from the new parts, is a large, swift-flowing stream, in which the sewers empty, and everything is carried down in the rapid flow. I next visited Frankfurt-on-the-Main. The country around the city of Frankfurt is so good for all character of cultivation that it is not needed to irrigate with the water from the sewers, and here is found a different system for the disposal of the sewage. There is the same arrangement as to the cleanliness of the streets as is found in all the cities in Germany, and nothing but the surface-water and that coming from the kitchens, yards and water-closets passes into the sewers. There is a regular system of sewers, small and large, running throughout the city, and all make final connection into a large one which runs along the river front and down below the city a distance, when it dips under the river, crossing over to the other side to a large works called Klarbecken Anlage (works of the settling basins). As this large sewer reaches the left bank of the river, it is met by one coming from Sachsenhausen, an old town which is now part of Frankfurt, but on the opposite side of the river. These settling basins are made quite deep under the ground, so as to get the proper fall for the sewer-water to run into them. As the water, which comes with quite a force, enters the works it runs over grates or sieves to catch the larger particles of stuff that may be carried along the stream. These large particles are shovelled off by men constantly, day and night, and hoisted up to the surface and deposited in a place therefor, from whence it is sold and hauled away. Destructible matter which would decompose is burned. After passing over the grates the water runs into the settling basins, which are 6 mètres wide at the top, 5·4 mètres at the bottom and 82·4 mètres long. At the entrance 2 mètres and exit 3 mètres deep. There are two sets or series of these basins, with six in

each, making twelve in all. Each basin has the capacity of 1,100 cubic mètres, so that the water in each remains six hours. The rapidity of flow is equal to five in and three out, at an average of four m. m. per second. Each group is calculated to receive a normal flow up to 20,000 cubic mètres, and in stormy weather a flow up to 40,000 cubic mètres per day. The whole works are arranged for 40,000 to 80,000 cubic mètres per day. These basins are covered with arches of brick, with many large air-holes to admit light and air. To destroy any odour or deleterious action of the water, an arrangement is made to mix two solutions—one sulphate of thonerde (clay), the other lime—with it, just as it is about going into the basins. These solutions are made by machinery, and run through tubes with many holes, and are placed just over the duct as the sewer-water comes through the sieve to the settling-basins. These mixtures destroy all deleterious matter and action, and cause the solid matter to settle by the time the lower end of the basin is reached in the regular course of the flow. At the lower end of each basin is a large gate, which can be raised when necessary to cleanse or make repairs. These gates are kept closed, and the water passing over is perfectly clear, and is run into the river Main. The slimy settling from the water flows to the lower part of the basin, and is pumped out by steam machinery and deposited in spaces or vats made for it just beyond the works. From here it is taken away free of expense by the farmers in the neighbourhood, who come for it in waggons or ship it in boats up and down the river to more distant places. In connection with the sewers there are in different parts of the city high beautifully-built ventilation towers, which carry off all the gases so that nothing rises up from the openings in the street. These towers are very ornamental and not in the least objectionable.

In Paris there is a complete system of sewers, large and small, and only surface water with that from the yards, kitchens and water-closets is permitted to flow into them. At one time the sewers emptied into the river Seine, which divides the city, but these outlets are now all cut off by large sewers called conductors, which convey the contents to the outer parts of the city for utilisation in irrigating and cultivating the surrounding country. The whole system is a perfect one, and of much benefit in the production of fine fruits, vegetables and flowers. In the collecting and removal of cesspool matter there are at present four systems—the permanent, the movable, the filter and the sewers. The permanent is the oldest method, which consists of a large cesspool in the courtyard of each house into which the waterclosets drain, and when the pool is nearly full its contents are pumped out at night and carried away. This system, although not introduced into any houses the past two years, is still the most in use, there being 64,700 such pools in the city. The cleansing of these is done by steam pumps in charge of a company, who take the matter out to dumps in the country, where they have factories to manufacture sulphate of ammonia by distilling the liquid after the separation of the solid and making poudrette from the latter. In the outskirts of the city the cleansing of the sinks is still done by old hand pumps. The movable system is that of receptacles like barrels, crocks, &c., with covers, which are stood in the closets on the different floors of the houses and removed when full. This removal is done in the day time. They are cumbersome and very unhealthy. The use of such receptacles is decreasing very fast. There are 17,700 in use. The filter system is much used, there being 33,800 in existence. This is composed of a cistern of masonry having a filter pipe running into the sewer. In the centre of this cistern stands a tub into which the pipes from the closets open. The solid matter flowing into this tub settles therein, while the liquid flows over into the surrounding cistern, to pass out through the filters into the sewer. It is the purpose to clean the inside tub when full before any of the solid matter contained therein can run over into the cistern and block up the filters. But this is not always attended to in time, and when an overflow occurs the whole affair becomes a filthy, dirty place, and becoming infectious, is a great source of disease. To get rid of all such infectious spots, a law was passed in 1886 requiring all closets and slop drains to be connected directly with the sewer.

The sewer system is well known and similar to that used here in this city, except in the sizes and shapes, the only difference being in that which is permitted to flow therein. Great care is taken that no solid particles, such as vegetables, papers, &c., are permitted to be thrown down the inlets nor into the streets. Any one throwing such into the street is obliged by the police to pick them up at once and carry them away. The sewage water is carried to the outskirts of the city in different directions to stations, where it passes over iron gratings or sieves to separate the larger particles that may unavoidably get in, and runs into a reservoir, from which it is pumped up into another reservoir, raised 10 or 12 feet above the surface of the ground, to give it fall enough to cause it to run into and through many ditches in the land to be irrigated. The openings in these elevated reservoirs are in the bottom, so that the settlings can run out with the flow. This system is an excellent one, and is of great utility to the surrounding country. The final running of the water from these irrigating ditches is perfectly clear and pure (by chemical tests made continually on the spot), and runs into the river.

In passing through the sewers I was surprised at the loss of odour. Nothing unpleasant was found. The sewers are constantly flushed by letting water run in the different streets daily at stated times. This is nicely done by an arrangement much better than our unsightly fire-plugs, and the stream is not thrown out into the streets, but only in the gutter, where the hydrant or plug is situated.

In reviewing the different methods as to their utility and adoption for this city, I must say that the surroundings of Philadelphia are such that the system in use in Berlin and Paris could not be applied here. There are no sandy or unfertile lands in the neighbourhood which could be irrigated, and only in New Jersey, on the opposite side of the Delaware river, can such be found, but too far to be reached, and even to do so it would necessitate the passing under the river, which is impracticable. It therefore narrows down to the one system—that of Frankfurt-on-the-Main.

Correspondence

What is an Artist?

SIR,—There has recently been a discussion on architecture and its relation to art. Architects, in my opinion, are artists because they are something else in addition, or, to put it in another way, few painters are artists because few are practical men, except where their individual interest is concerned. I venture to think that architects would not absorb the membership of a Royal Academy to the exclusion of painters and sculptors, as the painters in the Royal Academy virtually do, by practically excluding all the arts but painting. I also venture to think that an architect's conception of a saint would be different to Mr. Calderon's beau ideal, notwithstanding that his idea appears likely to immortalise his name, along with those of the Chantrey Trustees, on the roll of funny people. An architect has to think before he designs, as the best of architects and painters always have done. Modern painters, however, are able to dispense with meditation and historical knowledge when dealing with ecclesiastical subjects. Curious ideas are found where ecclesiastical art is concerned—the two mosaics in St. Paul's Cathedral, for instance. They occupy two adjacent spandrels in the dome. The second of these has been placed in the cathedral within the last week by Salviati. It is supposed to represent the prophet Daniel. The other mosaic, which at the foot bears the name of St. Matthew, represents the typical city magnate with a fashionable modern beard signing "the minutes of the previous meeting." The staid air of the business man is admirably rendered in the countenance. In default of a table a she-dragon with preposterous wings, as though representing one of many attempts in the production of a flying machine, is holding the book for him, while behind the Lord Mayor, say, a figure of a human type, and by no means angelic, if the budding wings are left out of calculation, having no work to do, is apparently looking out for a job. The introduction of gold and colour is, however, a great improvement to the dome, and the subject as representing the Lord Mayor and the griffin would be perfection in the Guildhall. In the second mosaic just erected Daniel would never recognise himself in the prizefighter form of man with the handsome countenance, who appears to be stretching himself after a nap, subsequently—judging from the lock of hair hanging down over his forehead—to having dined exceeding well. An angel above is balanced by another—angel, I was about to write—though the effect is that of an acrobatic bundle of linen done up for the washerwoman. A head is attached to the bundle, and there is a suspicion of impossibly-placed feet. These two objects are engaged in some mysterious operation over Daniel's head, if Daniel it be, indeed. They are probably snapping a bonbon cracker, stolen from the dinner-table, just as the awakening takes place. The drapery is certainly original in its treatment, to say the least. The moral seems to be:—Paint your picture or execute your decoration first, and then get a friend to give it a name. It is to be hoped that no painter will attempt to depict St. Catherine as a lady cyclist, but there is no knowing. If art and craft is to excel amongst us it will be through the help of architects rather than of painters, and to architects and other artists, excepting painters, is mainly due improvement in our arts and crafts, as also for the inspiring of love for art workmanship and the spirit of emulation to excel.

Yours truly,

ARTS AND CRAFTS.

Westminster Abbey.

Sir,—The labours of the six members of the Royal Commission appointed to inquire into the want of space for monuments have resulted in a deadlock, three recommending the erection of a chapel to the east of the Abbey, and the other three advising that one be built to the south of it. As to Mr. Pearson's north aisle scheme, they are unanimous in rejecting it, though the architect said in his evidence "he had a great love for such a solution of the problem." They admit that "neither of these (the above chapels to the east and to the south) would provide a building in such immediate contact with the main body of the church." Very good reasons ought to be forthcoming before a plan is sacrificed which provides what has all along been made an ultimatum for building any chapel at all in connection with the Abbey. The Commissioners go on to say, "We do not believe that the slightly greater distance at which they would stand could seriously hinder them from gradually sharing with the Abbey the place which it alone now holds in the feelings of the people," and they speak of "the unpopularity which would certainly beset its adoption." The Commissioners may be right in their estimate of the "feelings of the people," but much might be said against it. Then, to support their views on this point, they give the Archbishop of Canterbury's objections, which, however, are rather of the nature of recommendations, unless we are to admit that such adjuncts to our cathedrals as chapels, chapter-houses, cloisters, &c., do not add to their beauty and picturesqueness. This is what his Grace says of the north side :—"It is the only part of the Abbey in which you see the whole design of the church by itself, the south side is so entirely blocked up by other buildings, and the east end so altered by Henry VII.'s Chapel . . . the projection of the chapter-house is so great, and the alteration of the west end is so great, that there is no other part of the Abbey which gives you an idea of what was the original design of it as a great church." Well, Dr. Benson will not object to artists differing from him, and I therefore venture to say that, if asked to give the most beautiful view of the Abbey, they would decline to waste time on one from the north-west "showing the whole design of the church by itself," but would draw with delight a view from the south-east showing "Henry VII.'s Chapel, the projection of the chapter-house" in harmonious connection with the glorious Abbey itself as a background. Of course this is matter of opinion; but even a doctor of divinity will admit that it is an artistic question with which divinity has nothing to do. It is the nakedness—the modern nakedness—of the north side that at once suggests to artists and ecclesiologists that it is the most fitting site for an additional building, whether it be an aisle, a cloister or a chapel.

Surely something more than this deadlock was expected from this august Commission when it was agreed to incur the expense of it. What will Mr. Shaw-Lefevre, who has given so much time and careful study to this question, and who gave up his motion in the House of Commons for a Special Commission at the request of the Government, say to this absurd imbroglio? I apprehend that the House did not agree to leave this matter in the hands of the Government for so negative a result, and I presume therefore that, after all, a Special Commission, bent upon business, will have to be appointed, for on one point the six gentlemen are unanimous, viz. that there is no further room in the Abbey for future monuments commemorative of the nation's illustrious dead. Benedict.

The Eight Hours' Movement.

Sir,—Mr. Renton Gibbs, the well-known heating engineer, St. James's Works, Liverpool, having decided to give the eight hours' movement a fair trial, has accordingly arranged with his workpeople for a forty-eight hours' working week; and this he has done without any solicitation from the men, and with the view they will so appreciate this change that it shall become a permanent arrangement; for although this will necessarily cause a considerable increase in the wages, it is believed that by less hours' labour the men will be the better able to perform their daily work, and thus recoup their employer for this welcome concession. The Workers.

The Chester Corporation called in lately Sir John Coode to give an opinion as to the practicability of erecting floodgates in the river Dee at the old bridge, so as to prevent the sewage from being carried up the river to contaminate the water supply of the city. Sir John, who has sent in his report, states that damming the river as proposed is practicable, but holds that it is inadvisable, as it would prove detrimental to the shipping interests on the river. He suggests the advisability of removing the present intake, and the possibility of the sewage being diverted from the river and passed to a sewage farm below the city, or being dealt with by chemical processes.

GENERAL.

The Youngest Artist who has attained the honour of a medal at the Paris Salon is Mr. Harry Vander Weyde, who received his honours on July 2. He was born in Boston, is a descendant of the famous fifteenth-century old master of that name, and son of Major Vander Weyde, one of the veterans of the army of the Potomac, and now a well-known photographer in London. The young artist has also a picture in the Royal Academy.

The Full-length Portrait of Mr. Felix Joseph, by Mr. Knighton Warren, which the Corporation of Nottingham commissioned some months since for their Castle Museum, and which has been much delayed through Mr. Joseph's serious illness, is nearly completed, and will be on view at Mr. Warren's studio in the course of a few days.

The Dean and Chapter of St. Paul's Cathedral have given permission for the erection of a memorial to the late Right Hon. Sir John Macdonald in the cathedral.

An Heraldic Exhibition, organised as an adjunct to the forthcoming Archæological Congress, has just been opened in the Scottish National Portrait Gallery, Edinburgh.

The Wellington Monument, near Wellington, Somerset, is to be restored. The cost, including the building of a caretaker's house, is estimated at 1,200*l.*

The Court of Common Council have increased Sir John Monckton's salary as Town Clerk from 3,000*l.* to 3,500*l.*

Sir John Hawkshaw has bequeathed 500*l.* to the Institute of Civil Engineers, of which he had been president. The personal estate has been proved at 218,549*l.*

The Appointment of a surveyor to the estates of the Skinners' Company is announced, Mr. E. H. Burnell having resigned after thirty years' service. Applications are to be sent in to Skinners' Hall, Dowgate Hill, by Tuesday, the 14th inst.

Mr. A. Nelson Bromley, of Nottingham, has secured first prize in the competition for the Bury Municipal Buildings. Mr. H. T. Hare, of London, obtained second prize, and Messrs. Everard & Pick, of Leicester, third prize. In the competition for the Bury Market Buildings, Mr. A. Neill, of Leeds, obtained first prize, Messrs. Hornblower second, and Mr. H. B. Buckley third prize.

Messrs. Quilter & Wheelhouse, of London, have obtained the premium of 15*l.* offered for a design for the Oddfellows' Hall, Stafford.

M. Wyse has brought forward a scheme for the completion of the Panama Canal. It consists in creating a great inland lake, which would be reached by three locks on either side.

Mr. Freeman has just been re-elected city surveyor for Dublin.

A Society of Architects is proposed to be formed for Bedfordshire, the objects being (1) to promote personal acquaintance and good feeling amongst members of the society; (2) the general advancement of architecture in the county; (3) the maintenance of the interests, status and uniformity of the practice of the profession; (4) to consider questions of general practice; and (5) to promote the education of junior members of the profession.

The Library Committee of the Bolton Corporation invite designs for a branch library to be erected on land at the south-west corner of the Town Hall Square.

The Gloucester Archæological Society will hold its sixteenth annual meeting at Moreton-in-Marsh and Oxford on the 14th and three following days.

The Death is announced of Mr. R. C. Reade, M.A., diocesan architect of Torquay. Mr. Reade had been bathing in Compass Cove, Dartmouth, and it is supposed that in trying to reascend the cliffs he lost his footing and fell on to the rocks beneath.

The Board of the London Homœopathic Hospital, Great Ormond Street, have instructed Mr. William A. Pite, A.R.I.B.A., to prepare plans for a new hospital to be re-erected on the present site.

The Prizes have been awarded as follows to students of the classes in University College, London :—Architecture (under Professor T. Roger Smith) :—Fine Art—Donaldson Silver Medal, A. E. Kirk, of Leeds; prize, W. E. Hazell, of London; certificate, T. G. Lucas, of Hitchin; second class, H. E. Church, of Clapham, H. E. Matthews, of London. Construction—Donaldson Silver Medal, H. C. Corlette, of Sydney; prize, G. Gonsalves, of Trinidad; certificates, W. H. H. A. Kettle, of Brentwood, F. K. Kendall, of Blackheath; third class, W. J. Keith, of Ealing, E. Lyon, of Valparaiso, P. E. Newton, of Sydney, E. H. Terry, of London, R. M. Whellock, of Nunhead. Modern Practice—Prize, J. Borrowman, of Godalming; third class, T. H. Bishop, of Leighton Buzzard, C. W. Dawson, of Croydon.

The Architect.

THE WEEK.

On Tuesday the Hanover Chapel Bill came before the House of Commons on the second reading. Lord Cranborne explained the character of the measure. The chapel was not well attended; it stood in need of repairs that would cost 500*l.* or 600*l.*, and there was no fund available. The Duke of Westminster therefore offered a site worth 20,000*l.* for a new church, and powers were sought in the Bill for the sale of the building—probably to the Crown—and to apply the money in the erection and endowment of a new church. His lordship considered that any architectural reasons that could be brought forward would not weigh against the substantial arguments in favour of the Bill. Mr. Norris moved that the reading of the Bill should be postponed for three months. He pointed out that petitions against the Bill came from the Royal Institute of British Architects and the Council of the Royal Academy. He considered it was a desecration to destroy such old edifices. Colonel Makins said the church was only sixty-five years old; the real question was the convenience of the parishioners, and the House would be paying too much attention to sentimental objections if the Bill were rejected. Mr. Isaacson, as one of the oldest inhabitants of the parish, said the passing of the Bill would be a great boon to the people of the West End. Mr. Beadel said the church failed to answer its purpose. Mr. Labouchere opposed the Bill because, if the church was removed, it was only fair that the land, or its value, should be given back to the nation. Mr. Courtney said the question was whether it was for the convenience of the neighbourhood that the proposed change should be made. There were 107 in favour of the second reading and 91 against. A larger majority was to be anticipated, for the weight of argument was in favour of the Bill. The opponents, as is usual in measures relating to buildings, did not master their case, and it is a pity so important a part was assumed by Mr. Norris, who evidently considered the church was ancient. It is worth noticing that there was no recognition of the architectural value of the work.

A gentleman who had more than the average amateur's skill in art has lately passed away. This was the late Dr. Giron de Buzaremgues, who died in his eighty-sixth year. Originally he was trained as a doctor, and he practised in Paris for about twenty years. Then he was fascinated by politics. He was elected deputy for l'Aveyron, and as a staunch Imperialist he rose to the presidency of the Conseil-Général of the district. On the fall of the Empire he entered with ardour into the study and practice of art. Some of his figures appeared in the Salon. He also formed a valuable collection of ancient masters.

The report of the Improvements Committee of the London County Council shows that alterations are contemplated which will cost over two millions sterling. First in importance is the widening of the Strand, which will cost at least 501,500*l.* The committee recommend:—"(*a*) That the Council do apply in the next session of Parliament for powers to remove the block of buildings on the south side of Holywell Street, and to deal with the enclosed spaces, together with the public conveniences adjoining the churches of St. Mary-le-Strand and St. Clement Danes. (*b*) That provision be made in the Bill that the owners of the property, which by the removal of the block of buildings on the south side of Holywell Street will become the north side of the Strand, shall contribute about one-half the cost of the improvement by means of an improvement rate, the remainder of the cost being paid by the Council." Various schemes for more direct communication between the Strand and Holborn were considered by the committee. The one recommended is that for the formation of a new street 90 feet wide from the Holborn end of Little Queen Street, running straight in a southerly direction, passing between Freemasons' Tavern and the Sardinia Street Electric Lighting Station, intersecting Great Wild Street, Vere and Stanhope Streets, to the point where Drury Lane is intersected by White Hart Street and Blackmore Street, and then gently curving to the Strand, taking in the east corner of Catherine Street. The object of bending the street in this direction is to provide an easy gradient. The estimated cost is 933,000*l.*, including 121,000*l.* for rounding off the corner of Wellington Street. To make the thoroughfare a first-class one it is suggested that some novelty should be introduced, such as projecting galleries somewhat similar to those in the Rue Rivoli, Paris, and in Turin, or some system of glazed roofing, of which the gallery at Milan is suggestive; otherwise provision should be made for the planting of trees. Other improvements are the removal of Boziers Court, Tottenham Court Road, cost 50,900*l.*; widening of Nine Elms Lane, Battersea; widening of Battersea Park Road; widening of Bell Lane, Middlesex Street, a southern approach to the Tower Bridge. The total estimated cost, after deducting contributions, but without reckoning amounts to be received from the "Strand Improvement Rate," is 2,133,625*l.*, which is equivalent to a charge on the rates for net cost the first year (diminishing annually) of 0·7223*d.*, or rather less than $\frac{1}{4}d.$ in the pound.

On Tuesday the annual meeting of the Society for the Preservation of the Monuments of Ancient Egypt was held at Burlington House. The report did not record much success. During the year the energies of the Society had been directed principally to two points—the necessity for an official inspector or superintendent in Egypt, whose duty should be the care of the ancient monuments, and an endeavour to do something towards arresting the gradual destruction of the Great Temple at Karnak. Reports concerning a proposed scheme for barring the Nile below Philæ to make a vast reservoir for purposes of irrigation had appeared in the public papers from time to time, and recently various more definite communications had been received by the committee on the same subject. The result would be, it was acknowledged, to completely cover this beautiful island and temple with water. There had been some correspondence on this subject with the authorities in Egypt; but as nothing had as yet been decided as to any scheme of irrigation, and as a committee would be appointed to consider the whole question, it might be considered as suspended for the present, and the committee had thought it best to wait before taking any further action; but they would not lose sight of this important matter, and would oppose to the utmost of their power any engineering scheme which would involve injury or destruction to this world-renowned spot.

In *Black and White* of July 11 an article entitled "A Conception of Westminster Abbey as it would have been" is published. The article is accompanied by three sketches from the pencil of Mr. H. P. Burke-Downing, A.R.I.B.A., one showing the Abbey as it is, while a second gives Mr. Downing's conception of the Abbey if completed according to the probable intention of the original design. Mr. Burke-Downing's scheme includes a central tower, the height of which has been kept subservient to the general grouping of the building, and because it was probably the intention of the builders to keep the lantern low, judging from the lightness of the supporting piers. Wren's towers are replaced in the sketches by Gothic towers, in harmony with the general design. The third sketch shows the north transept as now restored, and also includes the proposed new central tower. As suggested by the article, there is nothing exactly new in a proposal for a central tower. Designs for a completion of the Abbey on what are supposed to be the lines of the original designers have been made from time to time by well-known architects; but this, we believe, is the first time an architect's design has been published. Mr. Burke-Downing advocates that there should be no interference with Wren's towers, while he shows that there can be no objections from a sentimental or structural point of view to a central tower. If Mr. Downing's suggestion is the means of rousing practical interest which will result in some such adequate restoration being taken in hand, he will have done good work in directing public attention to the matter.

ITALIAN ARCHITECTURE.*

THE instalment of M. PLANAT's admirable encyclopædia which is being issued to subscribers is of a character that would almost justify its appearance as a complete work. A volume that contains exhaustive articles on Gothic architecture, especially the German and English varieties, Greek architecture in general, the architecture of the Ile de France, Indian architecture, Italian architecture, the architecture of Languedoc, the Ionic order, Latin architecture, with others on Workmen's Dwellings, Commissions, Hospitals, Gardens, Hotels, Dwelling-houses (*hôtels privés*), Jubés, Covered Markets, &c., has manifestly a completeness which seems to be due to foresight rather than to the contingencies of alphabetical arrangement. All the articles, like those in the preceding volumes, are adequately illustrated by cuts that have been specially prepared. M. PLANAT continues to be lavish in expending money on his encyclopædia, and we trust he will receive the recognition to which he is entitled.

Every one of the articles is deserving of careful notice, but for the present we must confine our attention to the account of Italian architecture by Signor ALFREDO MELANI, a gentleman who labours with assiduity in order to make the art of his country better known and appreciated throughout the world. In this case he is not satisfied, like so many historians, with putting down the dates of the erection of buildings in proper order. The principal object of the article is to show how the Italians were not satisfied with deriving inspiration from foreigners, but at all times possessed native schools of architects, among whom independence and invention were fostered. In taking this side, Signor MELANI follows Signor DESPOTTI-MOSPIGNOTTE, whose "Della Razionalità Architettonica" appeared in 1852.

That even in a prehistoric age there were builders in Italy who could impart a special character to their work is evident from the remains of polygonal masonry at Fiesole and Volterra, and of rectilinear work, afterwards known as *opus quadratum*, at Rome and elsewhere. The Etruscans, who for the purposes of the argument can be taken as Italians, were, as constructors, far in advance of other peoples, and were the pioneers of sanitation. But it is, of course, impracticable to discuss questions of priority relating to work in so remote a time. There is less mistiness in considering such a subject as Doric. In the book mentioned above it was maintained that the characteristics of the style were known in Italy at a period when the Greeks had not got out of that nebulous state which is not favourable to art. Signor MELANI says there can be no doubt that the earliest Greek examples of the style are less primordial than in Italy. In one country the development can be pursued out of primitive forms onwards, and subsequently through tokens of decadence; while in Greece, of the tentative efforts there are few traces. At a later time a similar course appears to have been followed in relation to the Corinthian order. According to Signor BASILE, a Sicilian architect, the Corinthian of the Temple of Vesta at Tivoli has nothing in common with the Corinthian of the Temple of Jupiter or with the Choragic Monument at Athens, while it appears to belong to a class that has representatives at Palestrina, Pompeii, Solonte and elsewhere.

It is held by Signor MELANI that the architecture of Rome itself was grafted upon Etruscan work, and had acquired a character of its own prior to the exercise of Greek influence. Up to the third century of the Christian era the temples were erected by Etruscan architects; it was subsequently that the imitation, often cumbrous enough, of Greek forms came into favour. They possessed native examples of arches and vaults, as well as of columns called Corinthian, and there was no need to import similar, although more graceful, forms. Hence at a later period, when the study of Roman remains was pursued with ardour throughout all parts of Italy, there was not only an acknowledgment of the greatness of the city, but at the same time a recognition of a native principle in art. The Italians were ready to admit the supremacy of Greece in literature and sculpture, while remaining satisfied with the Roman buildings.

When Christian churches were allowed to be erected the type followed was the Roman basilica. But in course of time that type was modified under the influence of Byzantium. Signor MELANI does not attempt in his eagerness to make out his case to minimise that factor in the development of ecclesiastical art. Before as well as after the thousandth year of the Christian era the Byzantine spirit, he says, operated on all Italian work. It is seen in Lombard architecture. The Longobard DIDIER, afterwards known as Pope VICTOR III., brought a multitude of Greek artists to Monte Cassino, who, amidst the wreck of the old order, preserved the treasures of ancient literature by their copies of Classic authors and fixed a standard of art by their mosaics and *miniatura*. Ravenna and Venice are evidence of the fascination which the artists of Byzantium could exercise in Italy, although, of course, they were less powerful in more northern districts. But Signor MELANI insists that even in two such most characteristic works as St. Vitalis and St. Apollinaris it is possible to trace the plan of a Roman basilica. In Italy the Byzantine spirit was not blindly followed, rather it was acclimatised, and for that purpose it had to associate itself with local traditions and utilise the various local materials in construction. As regards St. Mark's, Venice, so little is known about the architects that M. BAYET conjectures they were Greeks, and according to M. CATTANEO, when Italo-Byzantine art arrived in the lagoons it found adversaries in the Greeks, and it required nearly a century before the new-comer partially triumphed by the fusion of the two styles. Further south, in Sicily, it seems to be manifest that such detail as appears at Monreale could only come from minds in which something of Greece still lingered.

Turning northwards, Signor MELANI is able to derive support for his theory from such catastrophes as the early invasions. The Longobards, he says, did not import any novelty in building, and were forced to employ Italian artists, the *Comacini* being numerous among them. The Lombards followed. The church of St. Ambrose, at Milan, founded in the ninth century, is a type of their architecture. Parts of course are fondly imagined to belong to a still earlier period, while Signor MELANI is doubtful whether the body of the building does not date from a later time than the ninth century. Whatever may be the period, in the Milan basilica, as in Lombardic churches in other parts of Italy, he sees local characteristics which suggest to him that the Lombardic style was not incompatible with an architecture that could be taken as belonging to Piedmont, Tuscany, Venice, Padua, &c. The degrees of assimilation varied. In St. Andrew, Vercelli, we find that the union of the two styles was not considered to be irregular as late as the thirteenth century. The building was erected by an English architect, DOMINIC BRIGHINTH or BRIGHINTZ. At Trent also the cathedral shows a similar experiment successfully carried out. In Tuscany, on the other hand, "the architecture of the Lombard period was unable to develop itself, for the conservative element there predominated, and was always attracted by classical antiquities." In Rome the Lombard style hardly gained a footing, but there are remains in the neighbouring Viterbo. Wherever found, it becomes evident that, whatever may be the value of Lombardic work as exemplifying style, it does not display any quality which is not racy of the soil of Italy. The originators were not great architects, and they seem to have improved in skill by absorbing whatever struck their fancies in local buildings.

In dealing with Italian Gothic, Signor MELANI has no easy task. The style cannot be said to have attained the perfection which seemed to be within command in France, Germany and England. But it is difficult to expect an Italian to underrate the importance of anything which exists in his own land. On the other hand, was Gothic an exotic, and therefore an exception to the theory which Signor MELANI expounds? The author frankly admits at starting, that owing to the character of the Italian climate, and the tendency of the people towards Classic art, it was impossible for Gothic to become fully developed in Italy. The cathedral of Milan was not commenced until 1386, but at that very time the Florentines were busy with the arrange-

* *Encyclopédie de l'Architecture et de la Construction.* Directeur P. Planat. Vol. V. Premier Fascicule. Paris: Dujardin et Cie.

ments for making their Duomo magnificent, that is to say, Classic, for GIOTTO, TADDEO GADDI and ORCAGNA set out in the course which BRUNELLESCHI followed. Gothic was introduced too late, and it was only in Piedmont, a frontier province, that it displayed any vitality. The style, too, was especially adapted to northern climates, and needed too many modifications before it was applicable in Italy. It was truly an exotic, and this was made apparent in the difficulties which attended the erection of the cathedral of Milan. The directors of the works were mainly foreigners, and, if they could have realised their desires, all the workmen would be foreigners also, for the masons and sculptors of the district were not familiar with the style, and in consequence it would be difficult to find another costly building having so much detail that is valueless, as being examples of labour that was joyless throughout.

In contrast with the treatment of the style in Milan may be placed the Venetian manner. Signor MELANI explains this by saying that Venetian Gothic is Oriental Gothic or Arab Gothic, although the work of Italians who had imbibed the Eastern spirit of the city, and that its peculiar character is to be traced to the ornamentation and the use of marbles rather than to a recognition of the principles of the style. Again, in Florence there is another variety to be seen in Sainte Maria del Fiore and GIOTTO's Campanile. But these cases also are exceptional; the style "is based upon a system of polychromy applied to decoration; it has a tendency to the horizontal rather than the vertical; much is sacrificed to produce a sort of tabernacle work, and an elaborate system of framing is used to emphasise the principal divisions decoratively." In Siena there was also independence of foreign precedents and rules. The history of the cathedral reveals that the people were indifferent to any fixed plan, and changed the arrangements according to circumstances; for, as is well known, the existing building was originally intended to be no more than a portion of the cathedral.

The Renaissance of the fifteenth and sixteenth centuries must have had a peculiar meaning for an Italian. He could only interpret the new movement as a sign that people in various parts of Europe suddenly had become worshippers of the ancient works produced by his countrymen in Rome or elsewhere in Italy. He knew of no higher standard, and could not understand how anybody cared to look beyond Italy towards Greece. To an Italian in that age Athens was little more than a dust-heap, and the remains were supposed to indicate a very small and poor Rome. Even when there was peace between Venice and the Turk, and the dangers of the journey were diminished, there were no scholars or artists forthcoming who were eager to gaze on the works of PHIDIAS or ICTINUS. Strong as was the passion for ancient works, it never led men beyond Rome.

It was therefore excusable if an Italian architect considered that whatever was best in his art was to be found in Rome, and that he was as justified in utilising the remains for suggestions as the scholars were when they derived inspiration from Classic literature. He was without any fear of an imputation of heresy when he rearranged the details of a building to suit his patron's convenience or his own, and saw no reason why he should not also create precedents. As Signor MELANI says, it was the ambition of PHILIPPE DE SER BRUNELLESCO LAPI to gain renown as the "rénovateur de l'architecture classique," and ALBERTI and MICHELOZZI had also a similar aspiration. But the spirit of the age in regard to innovators was seen in the history of one of BRUNELLESCO's works, the church of St. Lawrence in Florence. When he died the building was not completed. His successor, ANTOINE MANETTI, disregarded the plans and instructions left by the master, and followed his own notions of fitness in carrying out the final works. There was nothing fixed in those days, for old and new masters were treated alike.

Florence, Venice, Milan and Rome are taken by Signor MELANI as the cities where Renaissance architecture flourished. The architects of those districts, through prudence or principle, appear to have sacrificed occasionally some of their individuality for the sake of securing a local style; but it generally happens that the characteristics are associated with the artists, as is observed especially in the cases of BRAMANTE and PALLADIO. Even the baroque style which, as our author says, formed a connecting link between Palladianism and the free treatment of the seventeenth century, was only an effort to secure still more individual independence, especially in the use of ornamentation, than was possible when severe models were kept in view. MICHEL ANGELO must be classed among the exponents of the style.

In the next period still more license was claimed by BERNINI, BORROMINI and their followers, when stone seemed betwitched, for it was subservient to the most extravagant whims, and all the old rules of construction became obsolete. Everything became a sign of a personal feat in dexterity, and it is only in Venice Signor MELANI can discover the "influence du milieu" exercised as a restraining force over the artists.

Then there was a reaction, but not until nearly a century had elapsed. In the second part of the eighteenth century men were eager for definite codes of all kinds, and the old Vitruvian theories served for one in architecture. An impulse was also given to the study by the discoveries at Herculaneum and Pompeii, which revealed the beauty of an unexpected class of Italian work. The publication of PIRANESI's etchings of Roman buildings also helped to increase the power of antiquity. But the Italian nature is not to be manifested in faithful reproductions. The reformed architecture was, as Signor MELANI says, conventional, imitative and pedantic. A few good works were produced, such as GALLO's cupola for the church at Mondovi, and other structures at Cuneo, Fossano, Bene Vagienna. LOUIS CANINA was the best examplar of the style in Rome. But after all is allowed in favour of the return to ancient models there is no doubt Signor MELANI is correct when he says:—"Imitation at all times has been the most formidable of the enemies of art, and at the present time in Italy, through enthusiasm for the study of styles, we are daily found to be more distant from the true source of art—originality."

A few works merit to be distinguished from the countless showy mediocrities which represent modern architecture in Italian cities. The remarkable building known as the "Mole Antonelliana," which was designed for a synagogue, but remains in an incomplete state as a memorial of VICTOR EMMANUEL, deserves to be considered as a masterpiece which surprises the most intelligent constructor. The Victor Emmanuel gallery or arcade in Milan would be noticeable if size alone were considered. It has a length of about 650 feet, contains 1,260 chambers, and cost seven millions of francs.

There are many difficulties in the path of the successful architect in Italy. Finance counts for more than elsewhere, and financiers who are so often distinguished by the showiest of jewellery have a fancy that buildings which are to be profitable cannot be too obtrusive. A striking building is also supposed to be a sign of departure from old-fashioned ways. On the other hand, in no country is it easier for critics to find standards that will put all novelties to shame. The public insists on novelty, the judges decry it, an unlucky architect finds it hard to reconcile the two sets of ideas in his work. There is, too, an element of hopelessness in all things Italian, for few things realise the expectations of their creators, and where everybody is at heart a pessimist, the architect runs the risk of thinking that in the long run bad work serves as well as what is secure, thoughtful and refined. But these thoughts do not much affect the arguments of Signor MELANI. His countrymen in past ages cared more for designs which represented their own ways of thinking than for foreign work, although of superior quality. Whether it was wise to be so independent of the Greek mind is a question which cannot yield much profit to those who discuss it. The best Italian architecture, like the best Italian literature, was produced without regard for Greece, and there is no reason why excellent buildings should not be erected in Italy in which there is no trace of Neo-Grec. Signor MELANI has rightly grasped the character of his countrymen when he advises them to place a higher value on other things than accuracy in copying architecture.

The article is illustrated by a great many views of buildings that have been selected with care, and are executed in a manner that is suggestive of style. Altogether it may be said that Signor MELANI has infused new life into a subject on which it was supposed the final word was said long ago.

THE LINE OF FRONTAGE AND PRIVATE ACTS.

THE appeal in the case of the City and South London Railway Company *v.* the London County Council, before Lords Justices Lindley, Fry and Lopes, raised an important question, involving the right of the Electric Railway to keep its station at Newington in its present position, part of the building being erected beyond the general line of houses in Kennington Park Road. It was an appeal by the London County Council from a decision of a Divisional Court allowing an appeal from an order of a magistrate directing the demolition of part of the station. The City and South London Railway Company were empowered by their Acts of 1884 and 1887 to construct an electric railway from King William Street to Stockwell. Section 4 of the Act of 1887 provided as follows :—"Subject to the provisions of this Act, the company may make and maintain in the lines and according to the levels shown on the deposited plans and sections the subway hereinafter described, with all necessary approaches, tunnels, shafts, hydraulic lifts, buildings, works, machinery and conveniences connected therewith, and may enter upon and take and use such of the lands delineated on the deposited plans, and described in the deposited book of reference, as may be required for that purpose." By section 27 the company were required not to make any approach to the subway or any permanent tunnel, shaft, or other work, in such a manner as to interfere, after the completion thereof, with the carriage or footway of any street, nor to make more than two temporary shafts or openings in the surface of any street in the parish of St. Mary, Newington, without the consent of the Metropolitan Board of Works and of the vestry of the parish. The company acquired land at the corner of New Street and Kennington Park Road within the lines as shown on the plans, and constructed thereon two shafts, in one of which was a spiral staircase, and in the other hydraulic lifts affording access to the underground platforms. Over and adjacent to these shafts the company erected a station, part of which was erected beyond the general line of buildings, in contravention of the Metropolis Management Act, 1862. This part of the station contained the entrance-door, which opened on to the pavement of the Kennington Park Road, the booking offices, part of the waiting-room from which the lifts were entered, and another room. While the buildings were in course of erection the company were informed by the district surveyor that their buildings projected beyond the general line of buildings, and that unless the company obtained the consent of the London County Council to such erection they would be proceeding therewith at their own risk. The consent of the London County Council was never obtained. On June 27, 1890, the superintending architect of the London County Council, in pursuance of section 75 of the Metropolis Management Act, 1862, as amended by the Local Government Act, 1888, certified that the buildings of the railway company had been erected beyond the general line of buildings. If the company had acquired certain other lands, as they were entitled to do, adjoining those which they actually acquired, they could have erected a building equally convenient for the purposes of their undertaking within the building line. The magistrate found, as to the necessity and convenience for the company's said building, that a station building at the corner of New Street was necessary and convenient for railway purposes ; that the station building, without reference to the provisions of the Act of 1862 (25 and 26 Vict. c. 102, s. 75) was a reasonably convenient building ; that it was, however, not necessary for the purposes of the railway that any part of the station buildings should be erected beyond the general line of buildings ; and that it was convenient only in that the company saved expense by acquiring less land. The magistrate held that the company were not entitled to build as stated, and ordered the demolition of so much of the building as was beyond the general line of buildings in Kennington Park Road. The company appealed. The Divisional Court (consisting of Mr. Justice A. L. Smith and Mr. Justice Grantham) considered that the provision of the special Act which authorised the company to erect buildings necessary for their undertaking impliedly repealed the general Act, and they accordingly allowed the appeal. From this decision the London County Council appealed.

Lord Justice Lindley said that the question turned upon the joint effect of the Metropolis Management Act, 1862, and the City and South London Railway Act, 1887. The general Act which was first in point of date prohibited in general terms the erection of buildings beyond the building line of the street, except with the consent of the Metropolitan Board of Works, whose power had since been conferred upon the London County Council. The question was whether the special Act of 1887 had authorised the railway company to build a station in the way in which they had constructed it, some portion of it projecting beyond the building line. The view of the Divisional Court was that upon the true construction of the special Act it was impossible to read that Act so as to make it consistent with the general Act. The question turned upon the construction of section 4 of the special Act, and particularly upon the meaning of the word "necessary" and the expression "as may be required for that purpose" as used in that section. In his lordship's opinion the view of the Divisional Court was right. "Necessary" meant necessary for the undertaking without reference to the locality provided the buildings or other authorised works were within the lines shown on the deposited plans. The words "as may be required for that purpose" implied that the company were to be the judges of what they would require. The findings of the magistrate were important. He found, first, that it was necessary and convenient that a station should be erected at the corner of New Street, but he found further that it was not necessary for the purposes of the railway that any part of the station should be erected beyond the building line. Upon that finding the controversy arose. If the Court adopted the construction which his lordship had put on section 4, and were to accede to the contention of the appellants, that would be equivalent to telling the railway company that, though they had erected a building which was necessary for the purpose for which they were authorised to acquire land, it was nevertheless open to the County Council to dictate to them (the railway company) precisely where the building was to be and how it was to be erected. In his lordship's opinion, provided that the building was necessary for the undertaking, and was within the scheduled lands, it was no answer for the County Council to say that the building might have been erected quite as conveniently for the purpose of the undertaking somewhere else. The matter was made still plainer by certain limitations upon the powers of the railway company in the Act itself. The powers conferred by section 4 were declared to be subject to the provisions of the Act, and by section 27 the railway company were expressly prohibited from interfering with the street without the consent of the Board of Works ; but that section contained no prohibition as to projecting beyond the building line. The appellants had relied upon several cases, of which the Queen *v.* Wycombe Railway Company was the first ; but those cases turned upon the necessity of the thing to be constructed. The Court having found in this case that a station was necessary, there was no authority for compelling the company to build their station on any particular spot. The appeal failed.

Lord Justice Fry agreed. The special Act empowered the railway company to take and use such of the lands delineated on the deposited plans as might be required for the purpose of erecting a station, the magistrate having found that a station was necessary. These lands were partly within and partly without the building line in Kennington Park Road. It was obvious that section 4 was inconsistent with the general Act unless it were to be read subject to a proviso that nothing contained in that section should enable the company to build on land within the lines on the deposited plans unless it was also within the building line. His lordship did not think that the special Act ought to be so altered in order to make it consistent with the general Act.

Lord Justice Lopes concurred.

THE LONDON WATER SUPPLY.

THE Select Committee on the Metropolis Water Supply Bill met on Tuesday and agreed upon the terms of their report. The amended report led to considerable discussion. Mr. J. W. Lowther proposed the insertion of four new clauses —(*a*) dealing with the question of the adequacy in point of quality and quantity of the present supply, and the question of the sources from which an additional supply should be obtained; (*b*) recommending the appointment of a Royal Commission, composed of specially-qualified scientific members to consider how far, if at all, the supply at present derived from the Thames and Lea, and the springs and wells in the metropolitan water area, should be limited or extended ; (*c*) expressing the opinion that the complaint against the Chelsea and West Middlesex Companies respecting their agreements for additional intakes from the Thames have not been satisfactorily answered ; and (*d*) suggesting that local authorities within the metropolitan water area having their own independent rights should, in the event of purchase, be guaranteed in the exercise of their present rights. Of these all were rejected except the last (*d*), which was added to the report. The following is the text of the report as finally adopted and presented to the House :—

Your committee have proceeded upon the assumption that in the opinion of Parliament it is desirable to establish a single public representative water authority for the metropolis. The Royal Commission presided over by the Duke of Richmond reported in 1869 "that the future control of the water supply should be entrusted to a responsible public body, with powers conferred on them for purchase and extension of existing works, and for levying certain rates referred to." And the Select Committee of which Sir W. V. Harcourt was chairman, and

which examined into the provisional agreements for purchase contained in the Government Bill of 1880, reported "that it is expedient that the supply of water to the metropolis should be placed under the control of some public body, which shall represent the interests and command the confidence of the water consumers." Since these reports much valuable experience has been gained of the growth of population, and of the undertakings of the water companies and the demands upon them. Parliament also, since 1886, has adopted the policy of enforcing more stringent provisions in case of the issue of any fresh capital. An important inquiry into the whole matter, too, has recently been held by the Corporation of the City of London, and it is evident that there is much fresh light for the consideration of the question from every point of view. Your committee therefore consider it to be most desirable that the problem should be carefully and deliberately examined by the newly-constituted municipal authority, the London County Council, in the interests of the water consumers of the metropolis. The London County Council were, in the session of 1890, entrusted with powers to initiate negotiations with the water companies, and to incur certain limited expenditure in preliminary inquiries, but those inquiries are necessarily as yet incomplete. Your committee recommend :—

(i.) That powers should be granted to the London County Council to expend such further sums as may be reasonably necessary, in order that they may examine thoroughly for themselves, as the responsible municipal authority of London, the whole position of the metropolitan water supply, and come to a conclusion as to the policy which, for financial and other reasons, it is desirable to adopt.

(ii.) That, if they should so resolve, they should have power to promote a Bill or Bills in Parliament for the purpose of constituting themselves the responsible water authority for London, acting through a statutory committee, appointed either wholly by themselves or partly in conjunction with the Corporation of the City of London, as suggested to your committee on behalf of both bodies. Such statutory committee to comprise a certain number of members possessing special knowledge and qualifications, not necessarily members of the body or bodies appointing.

(iii.) That the London County Council, if constituted the water authority, should be required to purchase, either alone or in conjunction with such of the authorities of the outside areas as may be arranged, the undertakings of the eight water companies (except possibly certain lands of the New River Company) by agreement, or, failing agreement, by arbitration, within a fixed period.

(iv.) That, subject to any such arrangements, the new water authority should take over the duties and obligations which the present water companies now have towards the consumers of water in the districts outside the boundaries of the county of London, but within the limits of supply of the present companies.

(v.) That, in the event of purchase by the new authority, power should be given to that authority and to the authorities of the outside areas to negotiate for the purchase by the latter (i.) of so much of the works of distribution as is appropriated to the district of such local authority, and of the right to a supply of water in bulk from the new authority; or (ii.) possibly of some of the sources of supply which, with their works of distribution, it might be found practicable and advantageous to sever from the general scheme.

(vi.) That those local authorities which, like Croydon, Richmond and Tottenham, are situated within the metropolitan water area, but have their own independent water-supply, should, in the event of the purchase of the water companies by the new water authority, be guaranteed in the exercise of their present rights.

In the event of the undertakings of the companies not being acquired by purchase, the committee recommend that there should be a Parliamentary inquiry, before which the interests of the whole of the consumers within the area of the present metropolitan water supply ought to be represented, into the statutory powers and obligations of the water companies, and the control which is now exercised by public departments and the metropolitan and other authorities over them. In the appendix to the minutes of evidence will be found a memorandum setting out the existing conditions, but it might possibly be found advantageous to make the obligations and the control more complete.

Your committee found it impossible, within the limits of the time at their disposal, to conduct satisfactorily any examination into the quality and quantity of the London water supply. But, apart from that consideration, they are of opinion that these questions will naturally form a part of the complete inquiry which it will be the duty of the London County Council to conduct, with the assistance of the professional advice which, as your committee have recommended, should be at their disposal.

Although your committee have not been able, for the same reason, to examine into any of the cases sought to be established before them by the various local authorities of the areas in which are contained the present sources of supply, for the protection of their separate interests, your committee have received sufficient indication that there exist complaints, founded or unfounded, that those sources are in some quarters being even already overtaxed. Your committee do not see their way to recommending any practicable method for the effective association of any of these authorities with the inquiry, for which the London County Council must be responsible. But they are of opinion that in any such inquiry regard must be had, on the one hand, to the statutory rights of the present water companies, and, on the other, to the legitimate wants and necessities of the inhabitants of those areas. It must remain with Parliament ultimately to decide upon the merits of any scheme submitted.

In view of the possibility of its being ultimately established that the present sources of supply cannot be extended and that additional sources of supply are required, and as the possible fresh areas of supply are limited and are already being drained for other large communities, your committee think that Parliament may well consider, before granting any powers for further encroachment upon those areas, how far provision ought fairly to be made for the possible requirements alike of the metropolis and of the other large populations upon the lines of supply.

Of the two Bills before your committee for the constitution of a new water authority, neither appears to them calculated to effect a satisfactory solution of the problem, but your committee desire to place upon record their opinion that both those Bills were promoted in the public interest and to considerable public advantage.

KIRKSTALL ABBEY.

THE historic ruin on the banks of the turbid Aire at Kirkstall, which Colonel North, with conspicuous generosity, presented to the town of Leeds, is now, as our readers are aware, says the *Leeds Mercury*, being rescued from the ravages of time. Thus, under the care of its new custodians, it will continue to tell its story of the dim but interesting past to future generations of the inhabitants, and, indeed, to all who come from near or far to gratify their love of the antique. In the work that is going on, under the supervision of Mr. Micklethwaite, of Westminster, architect and antiquary, no attempt at restoration is being, or will be, made. The slow, but sure, demolition by the ruthless hand of Time, which the former possessors of the picturesque pile had unhappily allowed to proceed too far, is simply being arrested. The portions on the point of falling are receiving the strength they needed by the application of fresh mortar; something is being done to preserve the remaining traces of the walls whose superstructure is gone; the mere *débris* is being cleared away; and well-directed efforts are being made generally to achieve the desirable object, while care is taken to avoid, as far as practicable, anything which would rob the ruin of its hoary grandeur. On Saturday afternoon a number of the members of the Thoresby Society, with their friends, visited the Abbey, with the twofold object of seeing the work of preservation now going on and of listening to Mr. Micklethwaite, while, as the spokesman of the eloquent ruins, he told of the builders of the Abbey, pointed out the peculiarities of their handiwork, and, by a graphic description, filled in the gaps, making for the imagination of his auditors a perfect whole. Much that was of interest he said regarding the daily routine of both the clerical and lay brethren, their religious services, the observance of the rules of the order, and the life generally of the pious Cistercians, who were the Puritans of the Catholic Church in Mediæval times. The idea of the original orders of monks was that to live in the service of Heaven they must spend their time at their devotions. The Cistercians, who built Kirkstall Abbey, however, took the view that the work of man's hands is also an acceptable service, and they therefore provided a place for those who could not read but who could labour. In the twelfth century very few men in Western Europe, excepting those educated for the clerical life, could read, and many of the untaught were imbued with the desire to follow the monastic life just as much as were the clerics. The Cistercians started a second order called the lay brethren, who were as truly monks as the others, though they worked in the fields for the common good and only spent a portion of their time in the church. The buildings of the Cistercian order, like their services, were as plain as they could possibly be made. The earlier abbeys erected by them were, said Mr. Micklethwaite, as bare as a coal-cellar, though they were of stately dimensions and exceedingly well built. Kirkstall was one of their later buildings. All this, and much more regarding the Cistercian order, was probably known to most of the gathering, but nevertheless the party must have been grateful for the address. What was no doubt of greater interest was the description of the various buildings, and the purposes to which they were devoted, by a guide who seemed to know every stone, and whose thorough acquaintance with all that pertains to the subject proclaimed

his devotion to this department of antiquarian research. There is one drawback in visiting Kirkstall Abbey. The pleasure of exploring it is sadly marred by the sight of the black, foul river in the immediate vicinity. What a change is there since the days when the monks supplied their table with trout caught in the stream!

TESSERÆ.

The First English School of Design.

THE Society of Arts, or, to give it its full and more suggestive style, the Society for the Encouragement of Arts, Manufactures and Commerce, was instituted in London in 1754, and incorporated by Royal Charter in 1847. The credit of having proposed the formation of this important Society, which has been of inestimable practical value in the precise directions indicated by its title, is due to a landscape-painter named William Shipley (brother of the then Bishop of St. Asaph), who in 1753 suggested its establishment, and a school of design was one of its first offshoots. Mr. Shipley himself superintended it, and Richard Cosway, the celebrated miniature-painter, received the first premium of 5*l.* at the age of fourteen. This school of design was the result of a meeting of noblemen and gentlemen, clergymen and merchants, held at Rawthmell's Coffee-house, Henrietta Street, Covent Garden, on March 22, 1754, when it was proposed, amongst other matters, to give rewards for the best pieces of drawing, "and it being the opinion of all present that the art of drawing is absolutely necessary in many employments, trades and manufactures, and that the encouragement thereof may prove of great utility to the public, it was resolved to bestow premiums on a certain number of boys and girls under the age of sixteen who shall produce the best pieces of drawing and show themselves most capable when properly examined." We learn from a note appended by Burnet to the earliest of Sir Joshua Reynolds's Discourses that there were present at this meeting Viscount Folkestone, Lord Romney, Dr. Hales, Mr. Goodchild, Mr. Lawrence, Mr. Messiter, Mr. Crisp, Mr. Baker, Mr. Brander and Mr. Shipley, who acted as secretary. At their next meeting, in the following week, an advertisement was drawn up offering their first premiums, viz. "for the best drawings by boys and girls under the age of fourteen years, and proof of their abilities on the 15th day of January, 1755, 15*l.*, to be determined that day fortnight; likewise for the best drawings by boys and girls between the age of fourteen and seventeen, with like proof of their abilities on the same day, 15*l.*, to be determined that day fortnight." Nor did the Society confine their premiums to youthful candidates only, but extended their patronage to historical paintings, landscape, sculpture and architecture, without limitation as to the age of the candidates, and in the space of twenty years expended the sum of 7,926*l.* 5*s.*, besides ten medals of gold and six of silver, seventeen gold palettes and eighty-four of silver.

Bricks with Designs in Relief.

During the excavations for the St. Katherine's Docks in 1831 six ancient bricks with designs in bas-relief were met with. The subject of the first was the Annunciation of the Blessed Virgin; of the second, the Nativity of our Saviour; the third appeared by the lion to be a representation of the Evangelist St. Mark; the fourth bore the figure of St. John, the eagle holding his inkhorn. Both the Evangelists were delineated in the act of writing their respective gospels. The design of the fifth brick was not scriptural, but intended for a representation of some naval combat celebrated in Roman history, as may be inferred from the costume of the figures, probably the battle of Actium. In the prow of one of the vessels (in a similar taste to many other examples of historical designs in the Middle Age) an anachronism was observable in the appropriation of offensive weapons—a Roman soldier was represented in the act of discharging a hand-gun. The sixth brick was impressed with a head, bold in its lineaments and wearing an over-arched crown, and on either side two dolphins connected with ornamental scrollwork. The bricks were all of the same dimensions and evidently of the same period, that is, about the beginning of the sixteenth century, or it may be a little earlier. Stamped bricks of this kind and age are articles of considerable rarity, and the antiquaries of the last century appear to have been much in error with respect to their makers. In Bagford's letter, appended to the editor's introduction to the later edition of Leland's "Collectanea," a stamped brick is noticed which was found in Mark Lane in 1670, about 28 feet below the level of the street, impressed with the story of Samson destroying the standing corn of the Philistines by attaching firebrands to the tails of foxes. Bagford was disposed to consider this brick Roman, and from the circumstance of some parched corn having been found at the same time near the spot that it had formed the key-brick of a vaulted granary erected in the Roman times. The very plain fact that the bas-relief on the brick represented the Scripture story stood much in the way of this opinion. An antiquary's conjecture is not, however, easily defeated, and Bagford got rid of the improbability that the Pagan Romans should represent the deeds of Samson on a brick by the suggestion that some Jews might wander into Britain, settle there under the Roman emperors, erect a granary in a Roman mercatorium, or mart, in Mart Lane, since, he supposes by corruption, called Mark Lane, and thus it happened that Samson's stratagem against the enemy of the chosen people was represented on a brick of the Roman age. By a communication inserted in the first volume of the "Archæologia" it appears that this brick was still at a later date considered to be Roman, but Dr. Tovey, the author of that paper, feeling dissatisfied with the manner in which the subject of its bas-relief had been explained by Bagford, referred it to a story in the "Fasti" of Ovid, to which, by several evident discrepancies, it had no real relation. The brick, engraved by Bagford, in form, dimensions and character corresponded exactly with those found at St. Katherine's Docks, as may be ascertained by a comparison with the print in the introduction to Leland's "Collectanea." This brick, and the burnt corn found with it, probably came from the ruins of some old house which had existed in Mark Lane before the fire of London. Considerable light was afterwards thrown on the age of Bagford's brick by the discovery of another of the same kind in the year 1808 in an old well at Gravesend, on which was impressed the story of the conversion of St. Hubert. Mr. Cruden, of Gravesend, published a small octavo pamphlet on the subject of that discovery and of stamped bricks in general, and plainly demonstrated that they could be no older than the period of Henry VIII. or the early part of the reign of Henry VII. From the external appearance of the six stamped bricks from St. Katherine's it was inferred that they were employed to decorate fireplaces before the introduction of the coloured and glazed Dutch tiles used for that purpose, and Mr. Cruden in his pamphlet makes the same conjecture.

Republican Rome.

The most densely inhabited areas of the city were the Suburra, between the Quirinal and the Esquiline, and the Velabrum, which descended from the Capitol and the Forum to the river side. While the hills were occupied by mansions of stone, surrounded frequently by courts and gardens, or connected one with another by colonnades, the lower levels of Rome were thronged with buildings sometimes of burnt, sometimes of unburnt brick, often merely of wood, constructed in lofty blocks of many houses each, which the law was constantly engaged in the vain endeavour to keep at a certain fixed distance from one another, to check the progress of the frequent fires. The houses indeed of the nobles were frequently encompassed by small huts, leaning against their outer walls, for the accommodation of their slaves and retainers; and to this extent the lower classes may have established themselves from an early date even on the Palatine; but it may be doubted whether the principal hills were traversed at all by streets, and whether they were accessible, except perhaps at a single point, for wheel carriages. The streets below were numerous, tortuous, and narrow. It is doubtful whether the houses, rising often to many storeys, were built with projecting upper works; generally there could have been no room in such close-thronged rows of buildings for any projection at all. We need hardly add that these wretched avenues were neither paved nor lighted; and when a distinguished warrior was rewarded with the special permission to ride home, when he supped abroad, on the back of an elephant, the honour must have been as embarrassing to himself as formidable to his fellow-citizens. The view of Rome from any of the elevated points within it or about it must have been singular to our notions, from the total absence of towers, spires and minarets, such as are equally conspicuous in the architecture of London and Paris, of Moscow and Kasan, of Constantinople and Cairo. The stranger who seeks to obtain a general idea of the features of the hallowed site at the present day climbs the lofty stair of the tower of the Senator's palace at the most central eminence; but there are innumerable churches from the domes of which a wide-extended view may be commanded of the city and the country around. Ancient Rome, till at least a very late period, had no such specular turrets. Even the columns of Antonine and Trajan rise from very low levels and barely overtop the heights around them. The Tower of Mæcenas, which stood on the loftiest site of the Augustan city, was probably but little raised above the noble mansions of the Esquiline quarter. To gain a general view of Rome, Martial as we have seen, directs us to the terraces of a garden on the opposite slope of the Janiculan. But every hill was crowned with the pointed apex of some conspicuous temple, and by such temples, indeed, rising above the general line of the housetop the horizon was almost everywhere bounded. And these, too, were surmounted by the statues of the gods, perched upon the highest pinnacles. The Roman as he walked in the streets, at least wherever an open space allowed his eye to range to the eminences around him, beheld the countenances of his country

gods bent down upon him from every side. The vision of the avenging deities of Greece, which Venus reveals to Æneas upon the walls of Troy, may have been suggested by the familiar spectacle of the divinities of Rome thus raised aloft, each on his own peculiar hill, to watch over the fortunes of the favourites of Olympus. After the conflagration of the city by the Gauls, it had been rebuilt, we are told, without any plan, and with no improvement in the style of its ordinary architecture. Every one ran up a house himself where he would, or built upon the roof of his neighbour; and so little were even the old lines of the streets regarded, that they were now frequently made to cross the sewers which had been formerly constructed to drain them. An old law had limited the thickness of the walls to one and a half feet in order to economise space; but when, with the increase of the population, and the expansion of the private dwellings of the rich, the precincts of the temples and the places of public meeting, it became necessary to raise storey upon storey, these foundations were not sufficiently strong to support the incumbent mass. The constant falling of houses is mentioned, along with the conflagrations and the inundations of the river, as one of the great dangers and inconveniences of city life. Things, however, grew worse and worse towards the decline of the Republic. The competitors for public favour expended their resources in erecting vast theatres, and contributing to the amusement of the voting multitude; but their tenure of office was too brief, their interest in the well-being of the masses too factitious, to allow them to devise wise and large schemes of metropolitan improvement.

The Dresden Gallery.

This gallery may be said to have been founded as early as the middle of the sixteenth century by the Elector Augustus I., who collected pictures by Cranach, Albert Dürer and other early German painters. It was enlarged by his successors, who brought together paintings scattered in royal residences, churches and public buildings, and purchased various specimens of the Italian and other schools. But it was the Elector Augustus III. (1733-63) and his Minister, Count Brühl, who acquired for the Dresden Gallery those treasures which have raised it to the first rank amongst the galleries of Europe. The Duke of Este Modena, being in want of money, like many other Italian princes both then and since, offered for sale the noble collection of pictures inherited from his ancestors. Negotiations were carried on through the agents of the Saxon Government with the greatest secrecy, in the dread of an attempt on the part of the people to oppose by open violence what they considered an alienation of national property. The intrigues and artifices devised by the Duke's Minister to outwit and cheat his German rival were worthy of the best period of Italian diplomacy. The price was, after prolonged wrangling, fixed at 100,000 golden sequins; but the Minister insisted upon a bribe of 100 sequins for himself, then exacted 8,000 more by sundry ingenious tricks, and triumphantly concluded the negotiations by robbing the Saxon of the gilded frames. The collection contained six pictures by Correggio, including the celebrated *Notte* and the *Magdalen*, Titian's *Christo della Moneta*, and Holbein's superb portrait of Thomas Morrett, goldsmith to Henry VIII., then believed to be that of Ludovico Sforza, surnamed "Il Moro," by Leonardo da Vinci; a remarkable instance of the uncertainty of picture nomenclature, as well as a signal tribute to the genius of the German painter. The next important addition to the gallery was the exquisite picture of the *Holy Family* by the same great master, which had passed from the possession of the descendant of the wealthy burgomaster, Jacob Meyer of Basle, for whom it was painted, into that of the Delfino family of Venice. The learned Algarotti, the friend and correspondent of half the royal literati of Europe, acted for the Elector, and the painter Tiepolo was the go-between. A thousand golden sequins was fixed as the price of the picture, but various conditions were insisted upon by the owners not unlike those attached to the sale of our own Paul Veronese by Count Pisani, and much cavilled at by hasty critics not acquainted with the manner of "doing business" in Italy. Signor Tiepolo was to receive "a present in silver plate and chocolate, and a cane with an amber head mounted in gold, worth fifty sequins," whilst 462 livres were to be divided between the major-duomo and other servants of the Delfino family. Ten years later the gallery acquired its greatest treasure—the *Madonna di St. Sisto*, by Raphael—which, for the union of the highest qualities of execution with the loftiest and tenderest sentiment, and the most exquisite beauty combined with dignity and majesty of expression and of form, is probably the most perfect picture that the art has produced. It was painted, as Vasari tells us, for the high altar of the church of St. Sisto at Piacenza. Tradition records that the painter, revolving in his mind during a sleepless night the treatment of his picture, suddenly beheld at the foot of his bed an apparition of the Virgin accompanied by St. Sixtus and St. Barbara, whilst two beautiful angels, leaning on the foot of his couch, gazed upon the divine vision. The looped curtains enclosed the heavenly picture. The enchanted painter seized the subject thus revealed to him, and produced his matchless work. The negotiations for the purchase were carried on with great secrecy through a Bolognese painter named Giovannini, and 20,000 ducats, about 10,000*l*., an enormous sum for those days, but certainly not too great for a priceless work, was finally accepted by the convent. The Dresden Gallery thus became possessed of the two masterpieces of the Italian and German schools. The Saxon Government have since employed agents, amongst whom at one time was Raphael Mengs, to treat for some of the most remarkable pictures in Europe, but no very important additions have been made to the gallery, which contains a large number of works of inferior merit, and is deficient in examples of painters of the early schools.

Ancient Gem Engravers.

Theodorus of Samos, about 540 B.C., is the earliest recorded. He engraved the celebrated emerald signet of Polycrates. Schiller has embodied a curious legend relative to this signet in a beautiful poem entitled "Der Ring des Polycrates." In the time of Alexander great progress had been made in this art, and many celebrated names belong to this period, among whom Pergoteles is pre-eminent, who alone was permitted the distinction of engraving the portrait of that great monarch, fortunate in possessing also the talent of Apelles and Lysippus. Between the eras of Alexander and Augustus flourished in Magna Grecia many excellent artists. Polycletes and Tryphon belong to this period. The time of Augustus beheld the perfection of the art. Dioscorides, Alexa, Aulus, Gneius, and many others of lesser celebrity, but principally of Greek extraction, lent their talents to the luxury of Rome. Ælius, Alpheus and Arethon maintained its reputation during the reigns of Tiberius and Caligula. Evodus, Nicander, Anteros and Hellen occupied the period from Titus to Hadrian, and Æpolianus belongs to the era of Marcus Aurelius. There are, besides, many artists whose chronological position is uncertain, among whom we may name Ætion, Agathemeros, Emon, Gaios, Glycon, Hyllos and others, all of whom were Greeks, practising under the Roman empire. The first development of the art in modern times took place under the fostering patronage of the Florentine family of the Medici, who gave great encouragement to this branch of the fine arts, and some of the works produced during the fifteenth century challenge comparison with the finest antiques, and the taste for collecting cameos was common among the princes of Italy. After a considerable decline, gem engraving again in the seventeenth century engaged the attention of artists and men of taste, and many fine works, both in Italy and Germany, were the result of this increased consideration bestowed upon it.

Laminated Beams.

The roof of the Leeds Town Hall, designed by Mr. Cuthbert Broderick, is noticeable for the absence of tie-beams, which allows of the ceiling of the hall being brought nearer to the exterior of the roof than is usually the case. The roof consists of eight sets of principals framed together. Each principal consists of a semicircular laminated rib, formed of twelve 1½-inch planks, 9 inches wide, nailed together and fastened with wrought-iron bolts and straps. They are placed in couples, and stand immediately over each of the columns in the hall. They are respectively 4 feet and 18 feet apart. The width of the room is 71 feet, and the springing of the ribs 53 feet from the ground. The entire height to the top of the roof is 99 feet, the hall being 73 feet high in the clear. This system of roof has been adopted more frequently in France than in England. The laminated rib is the invention of a French engineer. It was at first suggested for a bridge over the Rhine in the year 1811. Several years later M. Emy constructed several roofs on this plan, but all his roofs, being very near to the ground at their springing and without ceilings, are consequently much more manageable than the roof of the town hall, which has a very elaborate plaster ceiling attached to it, and the springing is at a considerable distance from the ground. Precaution had to be taken to insert several additional struts and braces as a preventive against any change of form or outward thrust. Both these points had been attended with the most complete success, there being not the least perceptible outward thrust or change of form. The latter fact was proved very satisfactorily by the plasterers, who were enabled to run the mouldings on the ceiling from the centre. The brackets for these mouldings were not gauged from a centre, but fastened to the ribs according to their sizes. If the principle of these laminated ribs were better understood, it is possible that many of our architects would adopt it instead of depending on three or four overstrained joints for one tie.

At Small Heath, Birmingham, a new Baptist chapel has been opened. The building was erected by Mr. T. Johnson, Nechells, to the designs of Messrs. Ingall & Son.

NOTES AND COMMENTS.

THERE is no city in Europe that can display so many reports about water as London, and yet the inhabitants seem to be as far as ever from obtaining an adequate supply. Nobody will be surprised at finding the latest Parliamentary committee proposing a fresh inquiry. It is a simple way out of a difficulty, especially when the holiday season is upon us. But do any of the members who prepared the report anticipate that the London County Council can make discoveries which have not been described in blue-books many a time and oft? The members of the County Council are already overburthened with business. If they will take up the inquiry there will be no lack of engineers and projectors forthcoming, their evidence will be reported at the utmost length at the cost of the ratepayers, plans will be lithographed, analysts will be employed, clerks of water companies will make protests, there will be discussions about the right of certain parties to appear, and the limits of the powers of the Council will be repeatedly defined. But, however involved may be the proceedings, they will simply result in demonstrating once more that there are few gathering grounds available, and that the use of any of them involves some risk. Having arrived at that end, there will be a short respite from the announcement of new schemes. The evil of these inquiries is that they make people imagine it is possible to obtain the best advice gratuitously. If the Council are serious in desiring control over the water-supply of the metropolis, the readiest and most economical way would be to seek reports from the most skilled hydraulic engineers in Westminster and pay an adequate price for the information. It will be much easier to consider half a dozen elaborate reports from experts than an indefinite number from the class of men who are likely to be heard at the inquiry.

THE French Commission of Historic Monuments has agreed to the application of the New York Society of Arts for permission to take a cast of the relief by RUDE on the Arc de l'Etoile, Paris, and which is known as *The Marseillaise* and as *The Departure of the Volunteers*. It surpasses the rest of the sculpture on the arch, and seems to be an embodiment of the revolutionary spirit which enabled France to assert itself against the rest of Europe. Nor is it necessary to be a revolutionist in order to appreciate it. The vigour seen in the group of men of various ages and in the youth who accompanies them, as well as the strange expression of the Bellona that hovers above them, elevate the work beyond political and social circumstances. The Americans have acted wisely in appreciating RUDE'S great production, which is worthy of a place beside the best work of all ages and nations. The cast will cost 40,000 francs. As it is the first time such a reproduction was undertaken, the French Government have ordered that another cast is to be taken for the Trocadéro Museum. It is possible the cast will be shown at the Chicago Exhibition with copies of other masterpieces of sculpture.

IF beauty of scenery can count for anything with archæologists, there is no doubt the members of the Royal Society of Antiquaries of Ireland will be able to carry all before them this year, for what other society, archæological, artistic or utilitarian, can discover such a place for meeting as Killarney presents? Shrewd Welshmen admit the supremacy of the Irish lake district, for the members of the Cambrian Archæological Association have wisely resolved to unite their stock of lore with that of the Irishmen, and to form a joint meeting of a kind that is unprecedented. In Fairyland there could be no more attractive excursions than await the members and their friends. On the first day, that is, August 11, Lord KENMARE'S demesne will be passed through to visit Ross Castle, Innisfallen and Muckross Abbey. Next day there will be an excursion to Aghadoe, and, it is said, "such as may desire can go on through the Gap of Dunloe and return by boats down the lake." Breathes there a man among the newest or oldest school of archæologists who can approach the scene and yet be free from such a desire? If one could be discovered, there are eagles enough left to render him a little justice. But Killarney, after all, forms only one item in the programme. The third day's excursion will be to Dingle, and there is plenty to be seen on the way, besides the Oghams at Ballintaggart. From Dingle there will be visits to Gallerus, Temple Gael, Kilmalkedar, St. Brendan's Oratory, &c., names which by themselves can excite interest. The stranger will find himself in a district where every step associates him with the legends of the dawn of Christianity in Ireland. To this remote region came bands of unknown solitaries, who found spiritual delight in the wild landscape, where there were only rocks and streams, sky and waves to be admired. Examples of the beehive houses, which were the scenes of many fierce mental conflicts, are still preserved, and are enough to give interest to any district. Some of these recluses, in their longing to be solitary, made voyages in frail skiffs of hide, and, according to the legends, saw the Atlantis of PLATO, the island to which some of the outcasts from Paradise were driven, and many other strange things rising from the waves of the Atlantic. St. BRENDAN was the most courageous of all, and the story of his adventures wiled away winter nights in many a Mediæval monastery. One of H.M. gunboats and a steam vessel will be available for members who desire to follow a part of the course of the primitive seekers after the unknown; but the character of the place is suggested by the official notice that, "owing to the precipitous nature of the Skellig rocks, the heavy swell of the Atlantic, and the absence of a landing-stage, the party will have to disembark in the ship's boats—a slow process, and one not to be attempted if the weather is at all rough." Archæologists who are not heroically adventurous will find provision has been made for them. After enjoying Killarney, they can follow another course that is safe as it is beautiful. A railway journey of three hours will bring them to Kilmallock, the Irish Baalbec, where there is much that can be called unique. Limerick comes next, and with it the Shannon, which leads to so much that is fascinating for eye and mind.

THE sixth section of the National Congress of Hygiene and Demography, which is to open on August 10, will be under the presidency of Sir A. W. BLOMFIELD, A.R.A. The subject of open spaces will be discussed by the Earl of MEATH; hygienic principles for the extension and internal improvement of towns by Herr STÜBBEN, city architect of Cologne; the control of the construction of buildings by Mr. BLASHILL, superintending architect to the London County Council. M. TRELAT will read a paper on the hygienic composition of walls; Messrs. LENNOX BROWNE and ERNEST TURNER on the sanitation of theatres; and Dr. THORNE THORNE on English isolation hospitals. Sir JOHN COODE will preside over section 7, that of engineering in relation to hygiene. Among the subjects to be considered will be sewage-disposal and water-supply, the drainage and irrigation of land in relation to health, and the destruction of refuse. Professors ROBINSON and PACCHIOTTI, Mr. BALDWIN LATHAM, Dr. CARPENTER and Dr. FRANKLAND will be among the speakers.

MEUDON is a favourite resort of Parisians on summer Sundays. Few of them, however, take much notice of a little house in the Rue des Pierres bearing marks of antiquity which has just been classed among the historic monuments of France, and is one of the smallest among them. This house was purchased on May 30, 1676, by ARMANDE BEGART, the actress, who was the wife of MOLIÈRE, and the cause of much of his unhappiness. It may be assumed that she made it the best-furnished house in Meudon. MOLIÈRE, by his appointment in the King's household, was connected with contractors for tapestries and furniture. As a theatrical manager, he was also interested in furniture. His own collection was sumptuous, and it was the property of his widow when she became owner of the Meudon cottage. Some looking-glasses that are fixtures are the only relics remaining in the house. The Maison d'Armande was found to be an obstacle to some public improvements, and accordingly a decree went forth for its demolition; but, in spite of the local authorities, the house is to be saved. After a long struggle it has been decided to include the building among the great cathedrals and other monuments which are the care of the State. The house will become more remarkable than ever, as its irregularity will be in contrast with the new buildings in which straight lines are predominant.

DESIGN FOR FACADE OF CHURCH OF THE HOLY TRINITY, CORK.

[The illustration of Entrance for Proposed Brewery Tap published last week shows premises of the New London Brewery Company, Limited. The architect is Mr. W. M. Brutton, 1 Catherine Street, Strand, W.C.]

THE FUNDS OF WESTMINSTER ABBEY.

THE following is a statement furnished by Dean Bradley as to the principal sources from which the funds have been drawn for the building, enlargement and maintenance of the fabric of the Abbey in early and recent times. It will be understood that up to the period of the dissolution of the monastery the word "abbey," when applied to the fabric, included not merely the church, but the whole of the monastic buildings of which it formed a part.

The history of the Abbey falls naturally into two periods. The first extends from the completion of the Abbey church of Edward the Confessor in December 1065 to the dissolution of the monastery under Henry VIII. in 1540. The second, from the grant of the charter of Queen Elizabeth in 1560, and the establishment of the collegiate body of deans and canons, &c., to the present time. The great changes which have taken place at a recent date will be briefly noticed.

During the first of these periods, a time covering nearly five centuries, the erection and enlargement of the Abbey church was mainly, though not entirely, the work of successive kings. The same was true as regards the first erection of the older monastic buildings. It will be remembered that the earlier of the two great Abbey churches, viz. that completed in December 1065, a few days before the death of Edward the Confessor, was entirely the work of that king; that the monastery and the church were both erected by him in close proximity to his palace, and that both were equally essential to the object which their founder had in view, viz. the erection of a burial-place for himself, and the endowment of a body of monks who, in addition to their other duties, should perform masses and offer prayers for his soul. Hence the twofold character of the Abbey church, which was at once a royal chapel and a monastic chapel; the chapel of a palace and the church attached to a Benedictine monastery.

The connection between the church and the adjacent palace was so far from being severed by the Norman Conquest, which followed within a few months of the Confessor's death, that it became closer, it may be said, with every reign, and was the source of unusual privileges and large grants of land and other sources of revenue to the abbots and the "conventual" body of Benedictine monks over which they presided.

The most conspicuous of royal builders were, it is hardly necessary to say, Edward the Confessor, Henry III. and Henry VII.; but the work of construction, both of the church itself and of the adjoining buildings, especially of the former, was carried on with much aid from many of their successors, among whom Edward I., Edward III., Richard II., Henry V. and Edward IV. were actually the most prominent. But there were few sovereigns who did not contribute in some measure to a building connected with English royalty by ties that grew stronger with every generation. It will be remembered that the work of Henry III. was limited to the eastern part of the existing church, viz. its centre and all eastward, the two transepts and a very small portion of the nave. The erection of the remaining portion of the latter was carried under his successors down to the time of Henry VII. The western front was not actually completed in its present form till 1741, about five centuries after the commencement of the work by Henry III. Even during the wars with France the completion of the western portion of the nave was aided by an annual grant from Henry V. of 1,000 marks, one moiety from the "Hanaper" office dues, the other from the duties on wool, hides, &c. Treasurers or, as we should say, commissioners were appointed for the prosecution of the work.

In addition to aid from kings, much of the constructive work was due to active and influential abbots. Not a few of these held high and lucrative offices of State, and in addition to special manors and estates assigned to their use had access to various modes of increasing the resources at their disposal, such as the obtaining the "impropriation" of the tithes of parishes on their property, a fruitful source of supply both to monasteries and to the founders and benefactors of colleges at Oxford and Cambridge, and the offering of spiritual benefits, such as masses and indulgences, to individual contributors.

The original lady chapel, afterwards replaced by that of Henry VII., attached to the east end of the fabric of Edward the Confessor, was mainly the work of two abbots, William Humez and Richard Berking. There is evidence that they obtained contributions from individuals in the manner mentioned above. It may have been the example and influence of Abbot Berking which suggested to Henry III., who, as a boy king of less than thirteen years old, had laid the foundation-stone of the new lady chapel the day before his own coronation at Westminster, on Whitsunday 1220, the great work of building the present Abbey, which he commenced in 1245 and completed, with the exception of the nave, in 1269.

In the fourteenth century Simon Langham did much as abbot (from 1349-61) for the fabric of the Abbey. He held, among other offices, those of Treasurer and Chancellor to Edward III., and in 1361 became Bishop of Ely, and Archbishop of Canterbury in 1366. He vacated the Archbishopric on becoming a cardinal in 1368, and died at Avignon as Cardinal and Bishop of Præneste in 1376. He was buried, as ordered in his will, first in a Carthusian church near Avignon, and after three years in St. Benedict's Chapel in the south ambulatory, the only Archbishop of Canterbury buried in the Abbey. By his will, drawn up at Avignon, June 28, 1375, he bequeathed the whole residue of his great wealth, after payment of certain legacies, to the fabric of the Abbey, using the word in its widest sense. There is evidence that he was exceedingly anxious for the completion of the nave westward, and had contributed largely to the funds required for the work; but the wording of his will is quite general. "Omnia alia bona mea quæcunque et qualiacunque ubicunque reperta fuerint lego fabricæ monasterii Westmonasterii predicti [*i.e.* prope Londoniam in Anglia]." The total amount of his benefactions to the Abbey in his lifetime and by his will were said to amount to 10,800*l.*, representing, it need hardly be said, a sum many times that amount in the currency of the present day. The great treasures thus disposed of were largely employed by his successor, Nicolas Litlington, whom he named first among his executors (abbot, 1362–86), in the completion of the south and west cloisters, the erection of the Jerusalem Chamber and college hall, the abbot's house (part of his work is still included in the present Deanery), the stone wall of the present college garden, and many other important portions of the monastic buildings.

A century later Abbots Esteney (1474–98) and Islip (1500–32), were especially distinguished as "builders." Both are said to have taken part in carrying to completion the west front, so far as it was completed before the time of Sir Christopher Wren, who speaks (in his report of 1713) of "the two west towers as not of equal height and too low, so that the bells are much lower than the roof; the great west window" (said to have been largely the work of Esteney) "is too feeble, and the gable end of the roof over it is but weather boards painted." Abbot Islip, together with Sir Reginald Bray, K.G., master of the royal workmen, Margaret Beaufort, "Countess of Darbie and Richmond," the king's mother and others, took part on January 24, 1503, in laying the first stone of the new "Chapel of our Blessed Lady." To make room for the new chapel, now called after its founder Henry VII., the earlier lady chapel, including within it that of St. Erasmus, the work of Edward IV.'s Queen, was entirely demolished. The building, the funds for which were provided by King Henry VII. in no small measure from the suppression and appropriation, with license from the Pope, of existing religious foundations, priories, chapelries and tithes, was sufficiently advanced to allow of his own interment on May 11, 1509, and the roof and walls were probably completed by 1512. The total cost is said to have amounted to 14,000*l.* Abbot Islip, within ten days of the king's death, received from him 5,000*l.* for the completion of the chapel, but the actual master of the works was the Prior of St. Bartholomew's. No further addition has been made since that date to the space covered by the Abbey church, with the exception of a small vestry for the use of the choir added in 1881. But Abbot Islip, besides his large share in the completion of the west front, also erected within the church his own chapel, and completed what is now called the "Jericho Parlour," adjoining the Jerusalem Chamber, and the rooms above it which still form part of the deanery.

The maintenance and repair of the fabric of the Abbey, in the word's wider sense, was no doubt a heavy tax on the resources of the community long before the Reformation. Even

* The first recorded instances appear to be those of Wandsworth and of Battersea under Abbot Laurence, abbot about 1159–75, in the reign of Henry II.

so early as Henry II.'s reign there is mention of a grant obtained from that king and the Empress Maud by Abbot Laurence for providing lead for roofing some of the monastic buildings. Their repair was no doubt largely provided for in ordinary times by the income derived from landed and other property situated in no less than fourteen counties, supplemented by the frequent impropriations of tithes and other measures. The result of the Wars of the Roses was no doubt greatly to diminish these resources, and in a remarkable letter from Edward IV. to Pope Sixtus, written in May 1478, he speaks, no doubt in exaggerated language, "of the Monastery of Westminster, consecrated by St. Peter himself, famous for the tomb of the Sainted King and Confessor, founded and built, though not yet completed, by our ancestors," as "now decayed by lapse of time, and almost on the point of actual ruin." The letter, which is in Latin, and dated from Greenwich, may possibly have been written by Abbot Esteney.

It will thus appear that up to the dissolution, or so-called "voluntary surrender" of 1540, the fabric of the Abbey had been both raised and maintained from the following sources:—1. The revenues of various sources expended by kings, either expended themselves or granted to the monastery. 2. The income arising from the estates and property of the monastery, and of those especially assigned to the abbots. 3. The gifts and bequests of individuals. 4. The impropriation of existing religious foundations, such as alien priories, tithes, &c., effected both by kings and by the monastery.

The question of repair and maintenance of the fabric was of course less prominent in this period than that of construction, not only from the comparatively short time during which the buildings had been exposed to decay, and from the smaller amount in the atmosphere of Mediæval London of any deleterious products of the combustion of coal, but also from the absence of any feeling against demolishing the work of former generations in order to replace it with new buildings.

The interval between the dissolution of the monastery in January 1540 and the establishment of the new Foundation, under the title of the Collegiate Church of St. Peter by Queen Elizabeth in 1560, was marked by strange vicissitudes in the history of the Abbey. In the ten years previous to the dissolution the king, Henry VIII., had received from the monastery large tracts of land in London, nominally in exchange for two newly dissolved priories, those of Poughley and Hurley; the property surrendered included Covent Garden, St. James's Park, Hyde Park, and the manors of Neyte and Eybury, &c., &c., much, that is, which is now included in Knightsbridge, Kensington, Chelsea, Belgravia and Westminster.

For ten years (1540–50) the Abbey was the cathedral church of a newly created diocese of Westminster. The Bishop lived in the abbot's house (the present Deanery). The Dean and twelve canons, with two masters and forty scholars, had estates assigned them, partly from the Abbey estates, partly from those of suppressed religious houses. In 1550 the Bishopric of Westminster was suppressed, and the Abbey was by Act of Parliament made a cathedral in the diocese of London. Many of the estates were alienated or "exchanged" with others belonging to the see of London; church ornaments, plate and property carried off. Even the abbot's house, *i.e.* the Deanery, was granted to Lord Wentworth. Queen Mary restored the monastery, recovered the house, and placed Feckenham there as abbot from 1556–58. Queen Elizabeth's charter for a collegiate church, &c., bears date May 21, 1560. Much of Henry VIII.'s settlement seems to have been followed. The great powers formerly enjoyed by the Abbot were largely continued to the Dean; the task of seeing to the repairs of the building was specially named as one of the duties of the treasurer, *i.e.* one of the prebendaries; but it is clear that no separate estates were set apart for the maintenance of the fabric.

Of the first four deans, Bishops Andrews and Neile are mentioned as having given special attention, the one to the repairs of the Deanery, the other to the general management of the property. During the whole of the interval between the death of Abbot Islip, 1532, and the appointment of Dean Williams, 1620, little or nothing appears to have been done for the actual fabric of the church. In 1571 the chapel of St. Catherine, in the little cloisters, was "taken down," and there had been much demolition and alteration of the monastery buildings in a period marked by the transition from a celibate to a married clergy.

Dean Williams (1620-40), who was also Bishop of Lincoln, and, later, Archbishop of York, and had been for a few years Lord Keeper to James I., spent large sums, not less than 4,500*l.*, on the church alone, besides no less, it is said, than 2,000*l.* on the present chapter library. He found the fabric in a dangerous state, and at his own cost repaired the north-west exterior and that of the south-east chapels. A Chapter Act of 1628 expressly contradicts "an unjust report" "that our Dean had repaired our Church out of the diet and bellies of the Prebendaries and revenues of the said Church, and not out of his own," proving both the absence of any real "fabric fund," and the curious survival of the general tradition that the responsibility for the maintenance of the fabric of the Abbey church rested elsewhere than with the members of the new ecclesiastic corporation which had succeeded to the Benedictine monastery.

Of course nothing was done for the fabric in the troubles of the Civil War. Much of the plate, vessels, and internal ornamentation of the church was carried away or demolished, and the clergy ejected, though the school and almsmen were maintained throughout under a "committee of management." Immediately after the Restoration, as large fines were received for leases, considerable sums were expended both in refurnishing and repairing the church in Dean Earle's short tenure of the deanery, 1660-62. But in 1662 Dean Dolben, afterwards Archbishop of York (1683-86), prevailed on the Chapter to assign henceforth a "prebend's share," *i.e.* one-fifteenth of the total annual divisible income, as derived from property in land or houses, to the fabric. The words of the Chapter Act passed on the day of his installation are:—"Ordered that the one-fifteenth part of every fine through the years beginning from the date hereof be reserved and employed for the repairs of the Abbey," the roof and vaulting of which were said to be in actual danger. So much importance was attached to this measure that in his epitaph at York, after mention of the part taken by the archbishop in building at Christ Church, Oxford, and in repair of the Bishop of Rochester's palace at Bromley were added the words "Cænobic Westmonaster. conservato."

The practice introduced by Dean Dolben of setting aside one prebend's share, *i.e.* one-fifteenth, to the fabric fund was adhered to till the handing over the estates to the Ecclesiastical Commissioners in the reign of Queen Victoria. The amount, however, thus produced, in spite of all that had been done by Dean Williams, proved quite inadequate; much of the property of the Abbey consisted of land in what is now part of London, but was then of small annual value. The average amount of the "fabric fund" a generation later, between the years 1711 and 1730, appears to have been 598*l.* 11*s.* 4*d.* The amount of "fines" received for the renewal of leases varied, of course, from year to year. Entries in the chapter-book show that there was a constant demand on the "fabric fund" for the repair of the houses of the Dean and prebends and of the school-buildings; and the introduction to "Keepe's Guide," published in 1683, speaks in the strongest language of the exterior of the building as "shrivelled and parched by the continual blasts of north wind, also by the continuous smoaks of sea-coal, which are of a corroding and fretting quality."

On February 2, 1697, a petition from the Dean and Chapter was laid before the House of Commons, stating that besides large sums laid out in the first two years after the Restoration, they had since that time expended nearly 20,000*l.* on the church, but that their surveyor reported that 40,000*l.* more was needed. A Bill had been read the second time on that day "for completing, building and adorning the cathedral church of St. Paul's." In committee the title of the Bill was enlarged by the addition of the words, "and for repairing the collegiate church of St. Peter, Westminster." The Bill received the royal assent on April 1, 1697. It enacts that one-sixth of the proceeds of a duty levied on coals imported into London should be paid over by certain Commissioners to a Commission, consisting of the Chancellor of the Exchequer, the Lord Chief Justice of the King's Bench and the Dean of Westminster for the repair of the collegiate church, and for no other purpose whatever. The Act was to be in force from 1700 to 1716. The amount produced by this I have not ascertained.

In the ninth year of Queen Anne's reign a fresh Act was passed for the completion of St. Paul's and the building of new parochial churches in London. It raised the coal duty from 1*s.* a chaldron to 3*s.*, and directed that 4,000*l.* a year should be devoted to the repair of the Abbey, which had for some years been vigorously prosecuted under the direction of Sir Christopher Wren, who wrote in June 1713 a very curious and interesting report in a letter to Dean Atterbury, both of what he had done in the time of Dean Sprat and what he still proposed to do. In this letter he speaks strongly of the state of the exterior. "The stone is decayed 4 inches deep, and falls off perpetually in great scales," and censures strongly "the senseless artificers from Normandy," who used the Reigate stone as the nearest like their own Caen stone, being a stone that would "saw and work like wood, but is not durable," so that "the whole fabrick is now disfigured in the highest degree." He speaks also of the north side as both disfigured and endangered by the close proximity of houses, the "tenants of which claim every inch to the walls of the church to be in their leases." The letter is printed in "Widmore" from Wren's "Parentalia." He reports even of Henry VII.'s Chapel, "A nice embroidered work, and performed with tender Caen stone," as "so eaten up by our weather as to call for some compassion." The Act was to be in force from A.D. 1716 to A.D. 1724. Even this large grant did not suffice for the needs of the Abbey.

Between the years 1731 and 1741 sums of 4,000*l.* were granted in at least four or five sessions of Parliament, and in

those years the greater part of Wren's projected plans, including the completion of the western towers and the removal of the houses from the north side, was carried out under Dean Wilcocks. In 1806 Dean Vincent applied to the Lords of the Treasury for aid to save Henry VII.'s Chapel. The Chapter had already expended 1,900*l.* on the roof, but their resources had been greatly crippled in 1803 by a fire in the Abbey roof,* which had involved an immediate expenditure of 3,800*l.*, and the chapel was in the greatest danger, owing to the decay of the stone, brought originally not from Caen, but from Huddlestone in Yorkshire, of which its walls and buttresses were built.

In 1807 a petition from the Dean and Chapter was presented to the House of Commons, in which a statement was made that in the last twenty years they had expended nearly 29,000*l.* on the church, and on the report of a committee of inquiry a sum of 2,000*l.* was granted for immediate repairs. Further grants in aid were made year after year, amounting in the aggregate, in the years between 1809 and 1822, to 42,000*l.* The Chapter continued to set aside for the fabric fund (including the repair of all prebendal houses, &c.) the one-fifteenth agreed to in Dean Dolben's time. To this was added, in due time, the produce of all sales of timber, of fees paid for the erection of monuments, and the interest or principal of any surplus sum from unused balances.

The following is a summary of the history of the Abbey fabric during the last half century. Early in the reign of Queen Victoria a great and growing increase in the revenue of the Dean and Canons was due largely to the great rise in the value of what had formerly been comparatively valueless suburban land owing to the growth of the metropolis and the demand for building sites. In pursuance with an Act of Parliament passed in 1840, the number of canons (or prebendaries) was definitely fixed for the future at six instead of twelve. To two of the canonries was annexed the cure of two Westminster parishes (St. Margaret's and St. John's), and the future income of the Dean and each canon was fixed at 2,000*l.* and 1,000*l.* respectively. The details were set out in Orders in Council of the dates of April 3, 1843, and August 8, 1853, respectively.

By the Public Schools Act of 1868 Westminster School ceased to be part of the "establishment" of the Abbey, and was placed under the management of the Westminster School Governing Body.

In accordance with an Act passed in 1868 an Order in Council was issued, dated August 7, 1869, by which the landed and other property of the Dean and Chapter was finally transferred to the Ecclesiastical Commissioners, and in accordance with a "commutation" or settlement then agreed upon, a certain portion of land and houses, calculated to produce about 9,900*l.* per annum, was made over to the Dean and Chapter, while another sum of equal amount in money was to be paid annually until a further assignment of real estate had been arranged. A sum of 20,000*l.* was also awarded to the Abbey for substantial repairs. The annual sum spent on the fabric out of the income of the Dean and Chapter in the fourteen years following the commutation amounted to 3,444*l.*; in those preceding the same date to about 2,320*l.* It will be remembered that the fabric comprised not that of the church only, but of all the collegiate buildings.

Shortly after the appointment of the present Dean (in 1881) the fabric of the church caused the gravest anxiety. This arose from two causes :—1. The very alarming character of a report on the state of the exterior of the fabric received in March 1882 from the architect and surveyor of the Abbey. It was obvious that a very large expenditure was required to prevent the most serious results. 2. The steady diminution of the resources at the disposal of the Dean and Chapter, owing to the fall in the value of the rents obtainable for the landed estates assigned to them by the "commutation" effected in 1869.

After much and constant communication between the Dean (on the part of the Chapter), the Ecclesiastical Commissioners, and Her Majesty's Government, two steps were taken to meet the difficulty. 1. An Act was passed in 1886 authorising the Ecclesiastical Commissioners, to whom the greater part of the Abbey property had been transferred, if satisfied, after full inquiry, of the urgent nature of the case, to make a grant to the Dean and Chapter of a sum of 10,000*l.* to assist in remedying the "present insecure condition of the Abbey." 2. In 1888 the Westminster Abbey Act was passed, followed by an Order in Council of November 17. In accordance with these the whole of the estates and property belonging to the Dean and Chapter, with the exception of the Abbey itself and the houses of its officials, were transferred to the Ecclesiastical Commissioners, they, on their part, undertaking to pay yearly to the Dean and Chapter a sum of 20,000*l.* Of this, after careful examination of the necessary annual expenses and charges, 3,250*l.* was to be set apart yearly as a fabric fund for keeping the Abbey and collegiate buildings in good substantial repair.

As this sum was obviously inadequate to meet the existing emergency, one of the six canonries, in accordance with the Act of 1888, was suspended, and various clauses introduced for enabling the Dean and Chapter to add, whenever possible, to the funds at their disposal for preserving the fabric.

Every effort is being made at present to repair the decay to which the building is constantly exposed. How far the resources at present available will prove adequate it would be out of place to discuss here. The object of this paper is to show, first, how large has been the part taken in the construction and repair of the fabric of the Abbey by kings of England in earlier ages and by the Parliamentary representatives of the nation in later times; and, second, that while some enlargement of its area may well be considered a matter of urgent national interest, it is of the utmost importance that due provision be made for the maintenance and repair of any addition which may at any time be made to the existing fabric.

The history of the Abbey is full of warnings of the absolute necessity of unceasing watchfulness on the part of those who are entrusted with the care of buildings, whether ancient or modern, which are exposed through a long series of years to the action of a London atmosphere.

* A full account of the fire, which so nearly caused the destruction of the Abbey, remains at the Deanery, in the handwriting of Dean Vincent. It was caused by the carelessness of plumbers, and broke out on July 9, 1803, about noon-day, in the central tower of the roof. It was extinguished before nightfall. Service was carried on from July 13, 1803, till May 9, 1805, in Henry VII.'s Chapel.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE usual monthly meeting was held last week, the president, Mr. Wm. J. Anderson, in the chair, when a paper on "English Renaissance" was read by Mr. John White. The revived Classic style that had its birth in Italy made its appearance in England towards the end of the sixteenth century. First seen in tombs at Westminster and elsewhere, it was before long employed in the princely mansions that the affluence of the period called forth, such as Longleat and Wollaton. English Renaissance is, however, seen at its best in the more modest country houses, and in the tombs and monuments to be met with in every old church. Of all these types the essayist showed beautiful illustrations. A discussion followed the reading of the paper, opened by Mr. John Arthur.

ARCHITECT'S FEES.

AT the Kent Assizes on Saturday the claim of Mr. Frederick Rogers, architect, against Mr. James, for 123*l.* 6*s.* 9*d.*, balance of account for professional services, was heard before Mr. Justice Mathew. According to the evidence, the plaintiff, in the years 1888 and 1889, was brought into connection with Scott's trustees, who were desirous of breaking up a park between Bromley and Chislehurst for building sites. In the course of his duty as architect and surveyor, he met the defendant. A portion of the park was called Sundridge Avenue, and here Mr. James decided to erect a residence. Acting upon his instructions, plaintiff prepared plans, which were in the first place accepted by defendant, but afterwards rejected, on it being ascertained that the cost of the house would amount to about 2,500*l.*, which was more than defendant was willing to spend upon the building. Other plans were afterwards submitted. These were accepted, and tenders were invited for the building of the proposed house. The tender of a Mr. Lay, builder, was accepted, plaintiff being advised that he was a responsible man. The estimated cost was 1,900*l.*, and it was not considered necessary that a clerk of the works should be appointed. Consequently the work of the contractor was entirely under the supervision of the plaintiff, as architect. It transpired that while making a pretext to observe the provisions of the contract with regard to the construction of the building, Lay, who failed before the completion of the contract, really did not do so, and it was ascertained that very defective foundations and footings were constructed, and other works carried out in an unsatisfactory manner. By reason of this defective work it was alleged against plaintiff that he had been guilty of negligence in having failed to discover that the provisions of the contract were not being complied with, and a counter-claim was brought against him to recover damages in respect of this negligence.

For plaintiff evidence was taken to prove that the defective foundations made but very little difference in the value of the house and that Mr. Rogers's charges were fair and reasonable.

For the defendant it was submitted that the omission of plaintiff to find out the fact that the builder was not complying with the specification prepared was negligence, for which he was responsible. There was no definition in law as to what negligence was in such a case, but a man who undertook to do duties for certain payments was bound to bring reasonable skill and care to bear upon the matter in reference to superintendence

and that sort of thing, and if, in consequence of his not exercising such skill and care damages arose, then he was liable.

Evidence was given by defendant and skilled witnesses, who put the amount of damages to which James was entitled by reason of plaintiff's alleged negligence at 870*l.*, which amount included a sum of 400*l.* allowed for a reduced capitalised rental even after all defects in the house had been made good.

Mr. Willis, for plaintiff, pointed out to the jury that, however disastrously a builder might carry out his work, if the architect exercised reasonable general supervision he was not responsible for any defects which were afterwards found to exist.

The jury found for plaintiff for 58*l.*, and awarded defendant 90*l.* on the counter-claim. His lordship gave judgment accordingly, with costs in each case, and declined to stay execution.

THE ROYAL ARCHÆOLOGICAL INSTITUTE.

THE approaching annual meeting of the Archæological Institute is fixed to take place at Edinburgh in the week between Tuesday, the 11th, and Tuesday, August 18. Earl Percy is the president of the institute itself, but the president of the meeting will be Sir Herbert Maxwell, M.P., F.S.A. (Scotland), and the members of the Council of the Society of Antiquaries of Scotland will act as a local committee. Amongst the vice-presidents are the names of the Hon. Hew H. Dalrymple, Archbishop Eyre, General Sir Murdoch Smith, Dr. Cameron Lees and Mr. J. Balfour Paul, Lyon King of Arms. Mr. John Evans, president of the Society of Antiquaries, will preside over the antiquarian section; the Bishop of Carlisle over the architectural section; and Dr. T. Hodgkin over the historical section. The sectional evening meetings, at which several interesting papers will be read and discussion invited, are to be held in the rooms of the National Portrait Gallery. Amongst the places to be visited during the week are the Royal Palace of Holyrood, the Castle of Edinburgh, Stirling Castle, Dunblane Cathedral, Linlithgow Palace, St. Andrews, Dunfermline, Rosslyn Abbey and Castle, Borthwick Tower, Crichton and Hawthornden; a day will be devoted to the caves of Fife, and another to the Roman wall, near Glasgow. On the last day a visit will be paid to the new Forth Bridge; and, if the weather should prove favourable, there is every prospect of a successful gathering.

THE ROMAN WALL, BONNYBRIDGE, N.B.

ANOTHER excursion of the Glasgow Archæological Society was made on the 4th inst., under Mr. Jolly's guidance, to the Roman Wall, near Bonnybridge, where several large and important excavations have been made, which have from time to time been surveyed and visited. The results are being prepared for permanent publication, and will duly be issued by the Society in a volume specially devoted to the subject. Many of the sections made have been filled up both here and on Croy Hill, from danger to animals and damage to property. Several still remain open for inspection, especially those in Seabegs Wood, near Greenhill, one of which shows a very good conduit running across the *vallum*, and these were visited on Saturday. But the chief point of interest was the attempt made by Mr. James Russell, Longcroft, who has admirably superintended all the explorations in that district, to restore the wall and ditch to their original dimensions and appearance, as they stood in the old Roman period, when occupied and garrisoned by the Imperial legions, nigh fifteen centuries ago. A portion of the ancient rampart was selected for the purpose, where the ditch was unusually well preserved, and the mounds on each side well defined, the southern mound representing the *vallum* and the northern the materials that had been excavated from the ditch. Here, as everywhere else, the stone foundation of the *vallum* was exposed, the kerbs being unusually well laid and the bottoming between them very firm. These kerbs, 14 feet apart, were larger and squarer than common, being on an average 12 inches long by 8 inches deep, all formed of the light-coloured, hard sandstone of the district, here everywhere easily accessible. Twenty-five feet of the *vallum* was selected, and on the original stone foundation an endeavour was made to rear up a rampart of turf and earth similar to the original turf wall or rampart erected by the Roman soldiers. The layers that remained lying upon the stone base were left intact, rising in the centre to some 5 or 6 feet, and all the materials that had fallen over the kerbs by time, pressure and decay, on both sides, were carefully thrown inside and packed as firmly as possible in their original position. The idea was that the amount of the existing layers remaining above the base, together with the earthy matters beyond the base down to the true soil, would afford approximately a means, and, in a remote degree, a measure, for restoring the wall to its original height. This, of course, could only be roughly approximate, much of the old rampart having necessarily been removed by natural causes during centuries of neglect and decay. The outside was faced with turf, as in the original plan, though it would have cost too much labour and expense, and been, moreover, beside the purpose intended, to have constructed the whole of turf in the Roman style. In this way the old wall has been completed to the height of 10½ feet, being thus 14 feet broad at the base, as determined by the old kerbs, which are visible on each side, and gradually contracting to a breadth of some 9 feet at the top.

There always exists, for military reasons, a considerable space between the wall or *vallum* and the inner edge of the ditch. This platform has been cleared down to the original surface, and it shows a breadth here of 25 feet, wider than usual; but this greater width is more or less maintained all through Bonnymuir Wood, on both sides of the camp of Rough Castle, in its centre. It was also an interesting point to determine, with some degree of certainty, the exact form of the ditch itself, for several forms were in use by the Romans. Diggings have been made at several places with this view, and both scarps, that next the *vallum* and counter-scarp opposite, have been found of the same angle and the shape that of the letter V, the average breadth at top being 40 feet and the depth of some 15 feet. Here the ditch has been carefully cleared down to the bottom of the V and up both sides, so that its contour is finely shown. The depth of the ditch was a difficult matter accurately to determine after the accumulations of ages, especially when much of the old *fosse* had been filled up more or less along its course. This has now been pretty accurately fixed, based on various considerations and actual measurements after careful excavation, with the above general result.

It seemed to be essential that the Roman soldier standing on the top of the *vallum* and perambulating it to and fro, to the ground traversed by his fellows on each side, should be able to see down into the bottom of the ditch, so that no vantage of ambush for his Caledonian enemies should be provided in a defence made by his own engineers. This principle seems a reasonable means of settling, with some degree of certainty, the height of the *vallum* at different parts along its long line. As now restored, a man standing on the top of the wall, at its restored height of 10 feet, can see easily, across the intervening platform of 25 feet, anyone standing in the ditch and over the mounds that rise from it on its farther or northern slope, from which the Caledonians made their attacks.

WESTMINSTER ABBEY AS A BURIAL-PLACE.

AT the outset of their undertaking the Commissioners who have been inquiring into the monumental question deemed it their duty to study the circumstances which led to Westminster Abbey being chosen for "the interment, and for otherwise preserving the memory of your Majesty's most illustrious subjects." In this inquiry they were greatly aided by the following historical sketch with which they were favoured by the Dean of Westminster:—

The earlier church, together with the monastery of which it forms a part, was built by Edward the Confessor on a scale of grandeur before unknown in England, with the express purpose that it should serve as his own burial-place. It was dedicated to St. Peter on December 28, 1065, and the king, dying on January 5, 1066, was buried near the altar on the following day. William the Conqueror, who asserted himself to be the heir of the childless Edward, and took every opportunity of paying all outward homage to his memory, was crowned hard by the grave of his predecessor on Christmas Day, 1066, at or near the spot on which every successive king or queen who has reigned in England from that day to this has received the rite of coronation. In the immediate vicinity of the Confessor were laid in due time the bodies of his wife Edith, and of Maude the Queen of Henry I., who, inheriting herself the lineage of Alfred, united in her descendants the race of the English kings with that of the Norman conqueror. William, however, and the monarchs who immediately followed him were buried elsewhere, and the growing fame of the church rested mainly on the extraordinary reverence which attached to the memory of King Edward, and on the fact of its being the royal church, belonging hardly less to the neighbouring Palace of Westminster than to the powerful Benedictine monastery.

Between the death of Edward the Confessor (1066) and the accession of Henry III. (1216), a cloud of legends and traditions arose around the name of the king (canonised in 1163), and the renown, both for sanctity and splendour, of the church in which he was buried was carried far and wide by countless pilgrims who came to worship at his tomb. Henry III., desirous at once to do honour to his venerated predecessor, and to tread as nearly as possible in his steps, demolished the greater part of the Norman edifice, and lodged the coffin of the saint in the most sacred (*i.e.* the most eastern)

portion of the beautiful fabric which he began to build in its stead, and the most important part of which he lived to complete. His own grave was placed on the northern side of the shrine to which the body of the Confessor was once more translated, and where it now rests. There, in the chapel beside the Confessor, were laid Henry's son Edward and his Queen Eleanor; there, also, Edward III. and Queen Phillippa; Richard II. and his Queen, Anne of Bohemia, and, last of all, King Henry V., in whose reign the nave or western part of the Abbey was lengthened and nearly completed. The interment of Edward II., of the Black Prince, and of Henry IV. elsewhere than in the Abbey was the result in each case of special circumstances. The demolition of the lady chapel, and the substitution for it of the magnificent Tudor building by Henry VII., sprang probably from much the same feeling as had prompted both the Confessor and Henry III. The founder, indeed, puts forward his desire to do honour to "our uncle of blessed memory Henry VI. and graunt dame of right noble memory Queen Kateryne," but neither of these rests within the building which bears his name; and the sums which he lavished on the edifice, the precaution which he took to endow monks to say masses daily, "while the world shall endure" "at the Jesus altar at our feet," even the direction that burials should be reserved for the seed royal, all point to the hope, felt by so many kings and nobles of an earlier period, that they might secure their own welfare in another life by the erection of a church to contain their tombs, and by endowments conferred on the monastic clergy.

But though these may have been the motives which mainly influenced the monarchs who built and rebuilt and enlarged the old church of St. Peter, other causes were at work which were gradually weaving Westminster Abbey and its surroundings, not only into the annals of the Kings of England, but also into the history of its people. Thus, on the separation of the two Houses of Parliament in 1282, while the Peers were gathered in the Painted Chamber of the Palace, the Commons met from the very first within the Abbey precincts, either in the refectory or the chapter-house, later in the refectory, and from the time of Edward III. for several centuries in the chapter-house; and the Abbey itself, honoured as the burial-place of its saintly founder and of so many of his successors, had become the recognised place of coronations, royal weddings and christenings, and the scene of splendid national pageants.

The interments, even in those early days, were not, however, confined strictly to the seed royal. The abbots certainly, from the time of Abbot Barking in 1246, were buried, with very few exceptions, within the church, and their tombs and funerals were in some cases, as in that of Ware and Islip, only second in importance to those of the kings. Yet it was only by slow degrees that others than those of the royal house, or the abbots of the monastery, obtained such honour. There seems no doubt that William Trussell, Speaker of the House of Commons under Edward II. and under Edward III., was buried in St. Michael's Chapel, not, indeed, in the neighbourhood of the royal tombs, but in the eastern portion of the north transept. In Richard II.'s reign a shock was given to contemporary feeling by the burial, in the sacred and royal chapel of the Confessor, of John of Waltham, Bishop of Salisbury, the king's trusted minister and adviser. Other friends of this monarch, including his tutor, the learned Robert de Waldebey, Archbishop of York, were by his orders interred, the last in St. Edmund's Chapel, the others in conspicuous and honourable portions of the church. In the reign of Henry IV., the year 1400 was marked by the burial of Chaucer, in what is now known as Poets' Corner; and Henry V. laid his standard-bearer, Lewis Robsart, in St. Paul's Chapel. This example was followed by Edward IV. and by Henry VII., to whose favour, it may be presumed, was owing the burial, in places of equal honour, of Humphrey Bourchier, who fell at Barnet, and Sir Giles Daubeney, Governor of Calais.

The monastery was dissolved in 1540, restored 1556, and again dissolved, and the present constitution of the church as a "Royal and exempt peculiar," under its existing title of "The Collegiate Church of St. Peter," was established by Queen Elizabeth's grant in 1560. In the interval a monument had been set up in 1556 in honour of the poet Chaucer, a few paces to the south of the spot where, 150 years earlier, he had been buried. But with the Reformation had come a great change. In the reign of Elizabeth especially the number of burials enormously increased; the chapels around the east end of the church being no longer used as places of worship, became simply receptacles of tombs and monuments, a wholly different character and style were gradually introduced and the effigies of the dead were placed in every attitude, lying on the side, kneeling, seated and standing. No less than four monuments of great ladies were placed on the site of the ancient altar of the chapel in which they were severally entombed. Mural tablets also began to appear, together with vast and lofty structures, such as those of Cary Lord Hunsdon, and of Lord Norris, his sons and family.

In the charter of Elizabeth nothing is said of burials in the Abbey, though in the Elizabethan statutes the Dean is mentioned as the person charged with the care and custody of the royal monuments. But it is certain that for some generations longer the honour of interment beneath its floor was mainly confined to those who were either connected with royalty by blood or affinity, such as the Seymours and the Greys, or had served the sovereign as great statesmen, lawyers or soldiers. At the close of the sixteenth and in the opening of the seventeenth century, however, we see beginning to appear the dawn of other claims to such honour. Spenser was the first poet buried, 1589, expressly and solely as a tribute to his fame as a poet; soon afterwards the same honours were paid to the memory of Beaumont in 1616. The commencement of the Civil War marked clearly a new era in the history of the Abbey. Dean Stanley says it was the period which, more than any other, shows the strong hold that it had laid on the minds of the whole nation:—"When not even the excess of Puritan zeal or the sternness of republican principles could extinguish in the statesman of the Commonwealth the longing to be buried in the royal monastery." It is evident that both the Protector and the Parliament were deeply imbued with what may be called the modern sense of the national value of such commemoration. Not only was Oliver Cromwell himself buried in the church sacred to the memory of Edward the Confessor, but in his lifetime he caused the remains of Ireton to be brought from Limerick, and laid in the easternmost part of the royal chapel, at the very spot expressly designed by the founder for an altar of "our uncle of blessed memory King Henry the Sixth." And Clarendon tells us how the body of Blake, the great Admiral of the Commonwealth, who died at the entrance of Plymouth Sound on his return from his last famous victory over the Spaniards, was by Cromwell's orders carried up by land to London, and buried with all solemnity possible, and at the public charge, "in Harry the Seventh's Chapel, among the monuments of kings, in order to encourage his officers to venture their lives." This, says Dean Stanley, was the first distinct notice of burial in Westminster Abbey as an incentive to heroic achievements.

Thenceforward tombs and monuments were oftener admitted within the church, avowedly as rewards for distinguished merit. The circumstances of each of these have been woven by Dean Stanley into a tale of surpassing interest in his "Memorials of Westminster Abbey." Here we need only recall the names of a few of the famous men so commemorated in order to show how, year by year, the interest in the Abbey became more closely bound up with the history, and grew with the growth, of the nation.

The chiefs of the Restoration, George Monk, Duke of Albemarle; Edward Montague, Earl of Sandwich; and James Butler, Duke of Ormond, were, like Buckingham in the reign of Charles I. and the Parliamentary leaders under the Commonwealth, buried amongst the kings in the chapel of Henry VII., and Clarendon, the Royalist historian of those troubled times, was laid at the foot of the steps leading into it. The grave of Bentinck, Earl of Portland, under its east window, represents the statesmen of the Revolution of 1688, while many more or less famous heroes and victims of the Dutch War and of the War of the Succession in Germany and Spain rest in other parts of the church. The funeral of the great Duke of Marlborough in 1722 was one of the most magnificent that ever passed through the portals of the Abbey, and his body remained for a time in the vault which held the ashes of Ormond and had been for a while the resting-place of those of Cromwell.

"The successors of Marlborough by land and sea carry on the line of warriors now chiefly in the nave, but the circle of their names takes a wider sweep with the advance of the century;" for the wars by which India and Canada were won and the North American colonies were lost have left many and marked traces in the graves and statues of those who perished in them. There are cenotaphs of Sir Eyre Coote, General Lawrence and others famous in the Indian wars of that time. There is also the huge structure to the illustrious but short-lived General Wolfe and mural monument to the ill-fated André. Lord Howe for a special reason was buried at St. Paul's, but his great battle on June 1, 1794, is recalled by the memorial to three of his captains, and three others are commemorated who fought in Rodney's crowning victory. "The funeral of Lord Dundonald in the nave, thus at the close of a long life reinstated in the public favour, terminates the series of naval heroes which begins with Blake. Nelson, who at Cape St. Vincent looked forward only to victory or Westminster Abbey, found his grave in St. Paul's." There, also, Wellington and Picton were buried, and few indeed of the leaders in the Peninsular War have tombs or memorials in Westminster Abbey. The later Indian campaigns are represented by the graves of Sir George Pollock, of Outram, and of Clyde; but the Crimean War and the Indian Mutiny are only recalled within the church by the memorial windows of the north transept, and outside it by the granite pillar at the western entrance, to the memory of the Westminster scholars (with Lord Raglan at their head) who fell in those campaigns. Yet

if the Abbey has not within the last hundred years so often as in early times received the remains or the monuments of distinguished soldiers and sailors, its honours have been more freely given to great Englishmen, who in other ways have won their titles to fame. They are so many that we will not here do more than mention a few of the most eminent in the various companies into which they have been grouped. We have already seen how the claim of kindred genius gave to Spenser a grave beside that of Chaucer, and how there were gathered around these two the tombs or monuments of Beaumont and Drayton and Ben Jonson. In like manner were afterwards added in the Poets' Corner, or in the south transept hard by, memorials of Shakespeare and Cowley, of Dryden and Milton, of Prior and Thompson, of Gray and Burns, of Longfellow and Browning, and of many others hardly less illustrious. There, too, is commemorated the work of a crowd of other men of letters, such as Goldsmith, Johnson, Brinsley Sheridan, Campbell, Southey, Wordsworth, Keble, Lytton, Macaulay, Grote, Thackeray and Dickens.

In various parts of the Abbey was also from time to time recorded the fame of great theologians of many generations, and of schools of religious thought differing as widely as those of South and of Barrow, of Watts and the two Wesleys. Of philanthropists, Wilberforce was buried there with the attendance of both Houses of Parliament, and "his statue sits nearly side by side with Fowell Buxton." At the western entrance stands the marble image of Lord Shaftesbury, and in the centre of the nave is the grave of Livingstone. Together with these are found memorials of celebrated doctors, architects, engravers, sculptors and musicians, and of famous actors and actresses. "It is a proof," says Dean Stanley, "of the late slow and gradual growth of science in England, that it has not yet appropriated to itself any special place in the Abbey;" but Sir Isaac Newton was, at the public cost, buried beneath its floor, and his monument holds a conspicuous position, while the achievements of other illustrious men of science, as, for instance, Herschel and Darwin, and the great engineers, Watt, Stephenson and Brunel, have also been recorded.

In the north transept, long appropriated to statesmen, and in the angle of the north-west transept, known as the "Whigs' Corner," Chatham and Mansfield, and Follett, Pitt and Fox, Castlereagh and Grattan, Tierney and Mackintosh, Perceval and Lord Holland, the Cannings, Peel and Russell, Palmerston and Cornewall Lewis, Cobden and Beaconsfield and many other political rivals, have found together their graves and monuments; while in the neighbouring aisles are laid the remains of many of those who added India to the British Empire, and there, too, a memorial was, after his chequered career, accorded Warren Hastings, "in that temple of silence and reconciliation where the enmities of twenty generations lie buried."

The foregoing brief narrative offers but a bare outline of the striking series of events by which Westminster Abbey has from its foundation been constantly identified with the annals of England, but it may be enough to show how it has come to pass that the old monastic church is looked to almost by common consent as the place in which national honours may most worthily be given to the illustrious dead of each succeeding age. We have seen how, though destined at first to be exclusively the burial-place of kings, no long time elapsed before great warrors and prelates, the only subjects who could in those days attain to pre-eminence, were admitted to the royal fane; how as time went by and knowledge spread, and others were given the chance of winning renown, to them also were granted graves and memorials within its walls, till as the circle of distinction further widened these honours were allowed to the most famous Englishmen of all professions and callings from whatever class they had sprung. The majestic pile, which rises in the busy centre of the great city, is indeed well suited for its solemn office. The harmonious proportions of its beautiful interior, the dark shadows of its lofty nave, the dim light of its long drawn aisles, fill the mind with feelings of reverence and awe, and Time, while it has flung around the building the mysterious charm of age, has also dowered it with memories which cover the whole history of the Anglo-Saxon race.

It is long since any royal tomb has been set up or any royal burial has taken place by the shrine of the Confessor, but the practice which renews in the old church of the palace at each successive coronation the great bond between the sovereign and the people has never been interrupted. So it was that on the occasion of the last State ceremonial, the noblest, the most touching, the proudest of all its pageants, when Her Majesty desired to make solemn and public thanksgiving for the prosperity and happiness of the land during fifty years of Her rule, it was felt that nowhere else could that great festival of settled government so fittingly be held as at the spot where every one of Her Majesty's predecessors had for eight centuries been crowned, where all around were lying in their last sleep the great Englishmen whose courage had achieved the dominion, whose genius had inspired the language, whose patriotism and wisdom had won the liberties and given the laws by which gradually and through many generations had been built up the greatness of the nation. Westminster Abbey, in its tombs and its memorials, joins the ancient with the modern monarchy of England, and binds up the past with the present of its people.

From the above summary it will also be seen that the habit of doing honour in Westminster Abbey to the memory of illustrious Englishmen was not established by the will of any-one man, nor in obedience to any Act of Parliament, nor was it carried out in accordance with any rule thought out beforehand. The custom grew and gathered force gradually and almost unobserved. This peculiarity is in harmony with the character and traditions of the people; but, on the other hand, such want of system and of adequate control has had the serious drawback that burials and monuments have in a multitude of instances been accorded to those who had no claim to national commemoration, and little heed has been paid to the necessary limits of space.

Immediately after the Restoration, as we have seen, the number of interments and memorials went on increasing rapidly, and there was at that time apparently no sense at all of the duty of economising the room available for such purposes. Burial was claimed for many of the lesser nobles, some of whom lie in the Ormond tomb, as Dean Stanley describes in "coffins upon coffins." But besides those who may have been thought, in their time at all events, notable personages, others were admitted who had no right whatever to such a distinction. The qualification of mere neighbourhood was allowed, a practice which naturally arose when once the old idea of the Abbey being exclusively a royal burying-place had become obscure, and application was made on behalf of those who had lived in the vicinity to be buried in the Abbey, because there was no other cemetery within easy reach. Want of space for graves or for monuments does not seem to have been felt or feared, even in the most highly prized parts of the Abbey, until the close of the seventeenth century; and as the chapels north and south of the eastern end became crowded burials began to take place, and monuments were set up in the whole of the choir aisles, in the north transept, and especially in the nave where but one had been erected before the time of the Civil Wars. Yet for several generations thereafter no effectual attempt seems to have been made to check this lavish use of the space that still remained. The selection in 1727 of a spot in the nave in front of the choir, which, as one of the most conspicuous in the Abbey, had been previously refused to various noblemen, for Isaac Newton's tomb and monument "marks the moment at which the more sacred recesses of the interior of the church were considered to be closed or to have lost their special attractions, whilst the publicity of the wide and open spaces hitherto neglected gave them a new importance."

At last the alarm was raised that the Abbey was being "loaded with marble," and various remonstrances, serious and satirical, were urged against the further crowding of the monuments. Amongst others the Dean reminded us of a mock "petition from posterity, to entreat that their case might be considered," which was addressed to the Dean and Chapter of that day. The effects of this pressure of public opinion may be traced in the steady diminution of interments in the Abbey. In the ten years 1681-90 there were 100 burials within the Abbey, in addition to 125 in the precincts. A hundred years later in the corresponding decennial period, 1781-90, there were but 31, and during the last seventy years they have hardly exceeded an average of one in each year. No registers are extant to tell the number of burials which took place earlier than A.D. 1600, but from those records which do exist it appears that between 1600 and 1863 there were 1,147 interments within the Abbey and 1,806 within the precincts. In the time of Dean Stanley, 1863-81, there were twenty-one burials within the Abbey and five in the precincts. Since the present Dean of Westminster has occupied the office seven interments only have taken place. These make in all since the year 1600, 1,175 within the Abbey and 1,811 in the precincts up to the present time.

It would not be possible to ascertain with certainty the exact amount of space still remaining for interments, except by taking up the pavement and searching the existing tombs; but so far as we can form an opinion from the evidence of Mr. Wright, the present clerk of the works, and of Mr. Poole, formerly master mason, it is probable that space might be found in the western end of the nave for about forty-five coffins; for about twenty more in the concrete which supports the wall at the north-west corner of the north aisle (spreading out at this point to some extent under the floor of the building); and besides, it is possible that in some of the larger vaults not yet quite full, and in a few other places, there may be room for twelve additional graves. Thus the number of future interments, even should it be deemed desirable to make use of every spot available for the purpose, cannot, we think, be set at more than ninety to ninety-five.

But it is when we come to consider "the present state of the Abbey as regards the facilities which it offers for preserving the memory of your Majesty's most illustrious subjects" otherwise than by interment beneath its floor, that we are confronted

with the most serious results that have followed from the want in former times of any adequate control or foresight in granting such national commemoration. The mutilation and destruction at various times of the old and delicate arcading of the church, and the curtailment of ancient monuments to afford sites for later ones, as well as the inappropriate attachment of tablets and busts to the pillars of the building, are visible evidences of the carelessness with which the intrusion of such memorials was for many generations permitted; while few will deny that the general effect of the stately interior of the building has been in some places seriously marred by the overcrowding of statues and bulky structures. Dean Stanley mentions and describes 214 monuments of persons interred within the Abbey and 94 cenotaphs, making together 308; besides, 42 memorials of those buried in the precincts are recorded by him: and while pleading eloquently in defence of the variety of tastes exhibited, and even for the effect produced by the unequal distribution of these honours, he insists that the time has all but come when it will be impossible, from want of space, to continue further the roll of monuments within the limits of the existing building. It was indeed stated to us in evidence that he had, in conversation, declared that there remained but two spots still available for the erection of statues to men of the greatest eminence.

VENTILATION OF THE HOUSE OF COMMONS.

AT one of the meetings of the Committee appointed to inquire into the ventilation of the House of Commons, Mr. David Plunket presiding, Mr. William Prim, consulting engineer to Her Majesty's Office of Works, was recalled, and in further examination by the chairman, described the arrangements for ventilating and warming the committee-rooms and corridors. The air, he said, was taken in from the terrace through the area at the bottom into a chamber, whence it passed along into a passage, and so to the heating apparatus, from which the air passed into the committee-rooms through the floors and skirtings, and in some places through a grating at the back of the chairman, the air coming into the corridors leading to the committee-rooms underneath the seats. The vitiated air passed through the ceiling by a shaft to the Victoria Tower, at the base of which there were two furnaces for the purposes of creating a draught. Bad air could only get back into the other rooms if there was a down-draught from the main vitiated air-shaft, which occasionally happened when a strong wind was blowing. A back-draught could be obviated by placing in valves such as had already been used in some cases. At the request of the Committee, the witness promised to prepare a plan showing where he would recommend that these valves should be placed. Continuing, the witness explained the difficulty there would be in letting an increased quantity of air into the reading and tea-rooms without causing a draught. Complaints had been made of a smell of cigar smoke in the House, which he found to be occasioned by a number of gentlemen smoking on the terrace close to the intake. A smell resembling sewer-gas was also complained of, but he was convinced that this came from the sulphurous fumes of passing barges, and not from the sewers. This opinion was confirmed by Mr. Jones, clerk of works to the House of Commons.

Mr. John Taylor, recalled and further examined by Sir Henry Roscoe, said that the alleged inefficiency of the drainage of Westminster would have no effect as regards the drainage of the House into the sewers. But the ventilators from the main drainage system were in a most foul condition, and they might influence the air in the neighbourhood. That was a most serious state of things, which ought to be remedied. In regard to the drains of Westminster, he recommended that a letter should be written to the vestry by the chairman of the committee, but the main sewers under the control of the County Council were in the worst condition, and ran immediately outside the gates of New Palace Yard. It would be expensive to carry the ventilators up to a greater height, but there would be no difficulty in carrying off the foul gas from the main sewer by that means. Mr. Jones, clerk of the works to the Houses of Parliament, recalled and further examined, explained the sanitary arrangements within the House, which, he said, were on the whole satisfactory. The Hon. E. Chandos Leigh, Q.C., the Speaker's counsel, complained of the smell of cooking and the heat in the room occupied by him, and suggested that another room might be given him. Mr. Isaac Shone, examined by Sir Henry Roscoe, said he was responsible for the ejector system, which was now working satisfactorily in the House. So far as the main drainage of the building was concerned, he could vouch that during those periods when there was not a heavy rainfall there was perfect ventilation. Mr. Phillips, who had acted as assistant engineer under Mr. Shone, having given detailed evidence with reference to the situation of the drains in Westminster, the Committee again adjourned.

On Monday last Mr. Binnie, engineer to the London County Council, explained the construction of the sewers in Westminster, which, he said, carried off not only the sewage matter, but also the storm water, upon which, as there was no system of flushing the sewers, they were dependent for that purpose. It had been pointed out by Major Tulloch, before the Committee of 1885, that those sewers might get charged with sewer-gas, and that when there were storms the sewer-gas might be forced out into the street. That was exactly what he was afraid of now, although it did not happen in the case of the heavy storm of last week. Then again, if, unfortunately, there were any house connections with the sewer, the gas might be forced up into the houses by the bursting of the trapping. Sir Joseph Bazalgette had also reported in January 1885, recommending that a communication should be addressed to the Westminster District Board drawing their attention to the suggestions of Major Tulloch's report, and stating that the Metropolitan Board of Works concurred generally with them. Sir Joseph himself also expressed his concurrence in those recommendations, and considered that this sewer, although, perhaps, not a source of immediate danger, should be abolished. This, however, had never been done, though a pipe would be quite sufficient in its place. The alteration would remove the evil of having a storage for sewer-gas and vitiated air under the streets. The fault that the County Council were gradually getting into with their main drainage system was that the street ventilators were being closed and the gas penned up. In places where the street ventilators were kept open and pipes were carried up above the summits of the houses there was perfect ventilation of the sewers. There was a certain amount of danger arising from the want of ventilation. Supposing the authority of the House were obtained for introducing a similar system there by carrying a ventilating pipe up the side of the Clock Tower, he should certainly recommend the County Council to do it at once. It was best to continue to get the air for ventilating the House from the river, and he was inclined to agree with Mr. Prim that the disagreeable smell which was sometimes noticed probably came from passing barges and steamers.

Mr. Wheeler, surveyor of Westminster, was then examined, and said that the drainage of Westminster outside the Houses of Parliament was in a most unsatisfactory state, owing to the want of capacity in the low-level sewer, in which radical changes ought to be made, either by enlarging the sewer or by taking away the water which it could not at present manage to carry. He did not agree with the suggestion made by Mr. Binnie of carrying a ventilating pipe up the side of the Clock Tower, and considered that gas given off by sewage should on no account be let out into the streets of London.

The Select Committee on the Ventilation of the House of Commons will, it is expected, examine one more witness, and then proceed to the consideration of their report. It is believed that they will recommend an enlargement of the air-inlets, and will also make a number of suggestions with a view to improving the general atmosphere of the committee rooms. The method of ventilation adopted in the lobby is also open to considerable improvement, the system of introducing cold air through gratings in the floor being a constant source of danger to members and attendants in hot weather.

REPAIRS OF PUBLIC BUILDINGS.

IN the House of Commons on Monday Mr. Buxton asked the First Commissioner of Works whether Messrs. Holland & Hannen, contractors for repairs, &c., of public buildings, agreed under their contract to pay the painters employed under their contract at the minimum rate of 8½*d.* an hour, the ratio generally accepted as current in the trade for competent workmen, and whether he was aware that, in violation of their agreement, they had within the last few weeks reduced the wages of some, or all, of the painters engaged on the work to 7½*d.*, and, if so, what action he proposed to take in order that the resolution of the House of February 13, in regard to the payment of fair wages under Government contracts, should be properly enforced.

Mr. Plunket, in reply, said that the question of the hon. member seemed to be based upon a misconception. Messrs. Holland & Hannen are not departing from the terms of their contract. The facts are that in the schedule of rates accompanying their tender the minimum rate for painters was higher. But this was owing to an error, and when they discovered the error Messrs. Holland & Hannen wrote to the Office of Works for permission to correct it, and to reduce the minimum rate for painters to 7½*d.* per hour. Having satisfied himself that for much painters' work 7½*d.* would represent the rate of wage "generally accepted as current for competent workmen," he agreed to the alteration, and the contract has been drawn on the basis of a range of wages for painters of from 7½*d.* to 9½*d.* per hour.

A Russian Church will be solemnly opened at Biarritz in September.

Correspondence

Architectural Education.

SIR,—After reading the remarks of the different speakers on Monday evening last, I am inclined to think that there is an element of pride that prevents the A.A. from looking beyond its own professional borders for pecuniary aid. It is of course pleasant for any society—architectural or other—to be independent, to do everything within itself and within its own walls. Some societies can do this because they have members who are men of wealth, and because their objects are more popular than I am afraid architecture can claim to be, at all events, until Mr. Kerr has educated the British public. The R.I.B.A. appears to be willing to assist the A.A. with means, but it is made pretty clear that much must not be expected.

Under these circumstances I venture to suggest that the Science and Art Department and the County Council and the City Companies be applied to. Mr. Baggallay and his friends, who have prepared "the scheme," could compose an irresistible petition, for he would speak of architecture—first of all the arts—being in pecuniary difficulties, and he might plead that such a state of things is a disgrace to the nation, for living architects have done everything in the way of liberality that could possibly or fairly be expected from them. When we see what science has done and proposes to do, it really seems that architecture, which includes all science and all art, deserves to be in a better position than, according to "the scheme," she really occupies. It is of national importance that architects should be properly educated. As I began by saying, the cause of the present difficulty is that those who have its interest at heart do not, like other people, look far enough afield. By adopting this plan science has erected and endowed the institution in Exhibition Road, South Kensington. She has just sent a memorial to the City Corporation praying it to grant a site on the Embankment for the erection of an art gallery which a munificent donor proposes to build. These gentlemen are moved to do this because of the many strong objections from the scientific point of view to the site suggested for the gallery in the first instance, *i.e.* on the vacant land adjoining the above building in Exhibition Road, and which they consider will be required for their own future purposes.

According to the report of the National Association for the Promotion of Technical Education, just published, the amount of public funds devoted to technical instruction, including the expenditure of the Science and Art Department, has about doubled during the year, while further expansion is to be looked for in the immediate future.

Perhaps the necessary help might come from this Association if the Architectural Association memorialised it. Its duties, it appears, have suddenly undergone a radical change. It has been so successful that its function is no longer propagandist, but simply consultative, for the movement is rapidly passing into its final stage. People no longer require to be told what they ought to aim at, but rather to be shown how the object may be gained. Technical education throughout the country has received a wonderful impetus from the Local Taxation Fund of 1890.

The report above alluded to shows that by far the larger part of the country has decided to give the whole amount to education, and though Middlesex and London have sunk the money in the rates, it must be remembered that the resolution only covers the proceeds of the new fund for a single year.—Yours truly, L. S. D.

One Hundred Pounds Reward.

SIR,—In a contemporary of last week is inserted, with the above heading, a notice of a certain ventilating company which, it will be admitted, exceeds the limits of legitimate advertising, seeing it is evidently designed to prejudice rival firms by a general accusation of unfair dealing. As I was for a number of years, until recently, in the service of Messrs. Boyle, it may be taken by some persons that the accusation is aimed at me, for the purpose of attempting to damage the "Climax" Ventilating Co., in whose service I now am. I would only suggest to Messrs. Boyle that they should make a distinct and straightforward accusation which, if it involves either the credit of the "Climax" Ventilating Co. or myself, will not be allowed to go unanswered, and Mr. Boyle will have the opportunity of repeating his assertion, on oath and under cross-examination, in the witness-box.

If Messrs. Boyle assert that the ventilators of the "Climax" Ventilating Co. "imitate the external appearance of the air-pump" or any other ventilator, I challenge them to prove it, as such an assertion bears on its face its own refutation, it being the aim of the company I have the honour to represent to take an entirely new departure by making even the cheapest of their ventilating appliances to harmonise with the character and architectural features of the building on which they have to be fixed.—Your obedient servant, J. ALFRED DARQUE.

15 Great George Street, Westminster.

P.S.—I would add I have sent a copy of this letter to each of the building papers.

The Eight Hours' Movement.

SIR,—The letter on page 30 from "The Workers" of Mr. Renton Gibbs's firm at Liverpool shows a step in advance has been taken. Will "The Workers" please state if they take breakfast before beginning work in the morning? Also, as they work 48 hours in the week, do they work 8½ hours on five days so as to stop earlier on Saturday, or how?

I have been advocating eight hours a day in the building trades for the first five days and five hours on Saturday, making 45 hours in all. Begin work each day at 8 A.M.—taking breakfast before beginning—then dinner from twelve to one, and stop at 5 P.M.

Were these hours introduced many working men, in place of being cooped up in narrow slums in our cities and large towns, might be able to stay in the country and rear their families in a healthy atmosphere instead of otherwise, as is so much the case at present. This eight hours' system may yet be the great means of counteracting the congestion of our cities.—I am, &c., W. B.

Glasgow: July 11, 1891.

GENERAL.

The Exhibition organised by a local society, and held in the palace of Versailles, contains this year about 800 paintings.

Mr. E. Burne-Jones, A.R.A., in collaboration with Mr. William Morris, has completed three windows for St. James's Church, Marylebone.

An International Exhibition of Photography has been opened in Brussels, and a congress on the science will be held next month.

M. Rodin, the French sculptor, has been entrusted by the Société des Gens de Lettres with the commission for the memorial of Balzac, the novelist, which is to be erected in Paris.

The Building Act Committee of the London County Council have recommended that Mr. Ellis Marsland, district surveyor for East Kensington, be appointed district surveyor for Camberwell upon condition that he resigned his present appointment, and that Mr. A. Crow be appointed district surveyor for St. Mary, Whitechapel, Christ Church, Spitalfields, the hamlet of Mile End New Town, and the Tower Liberty.

The Ecclesiastical Commissioners have authorised the sale by public auction of a portion of the site of the church of St. Olave Jewry, in the City of London.

The Ayr Town Council have agreed to pay Mr. Mercer 46*l.* for extra work done by him while acting as Burgh Surveyor.

Plans have been passed in Kirkintilloch Dean of Guild Court for the erection of a new Roman Catholic Church, which is expected to cost 5,000*l.* Mr. P. P. Pugin (Pugin & Pugin), Westminster, is architect.

Mr. James Mitchell has been definitely appointed Dean of Guild for Montrose in place of the late Alexander Lyall.

The Walsall Town Council have resolved to purchase 3,384 yards of land in Lichfield Street, as the site of public baths, which, if built at the back, will allow the front land to be disposed of at a greatly enhanced price for commercial premises.

The Birmingham Free Libraries Committee have appointed Mr. Henry Martin architect for the proposed free library and baths at Small Heath.

A Parliamentary Return has been agreed to be supplied on the motion of the Duke of Westminster, showing the number of churches and cathedrals in every diocese which have been built and restored at a cost exceeding 500*l.* since 1873, the expenditure in each case, and the sources of the funds.

The Joint Committee for restoring the Cork Courthouse offer a first premium of 100*l.*, a second of 60*l.*, and a third of 40*l.* for the best designs, to be sent in before August 28. The author of the design selected will be employed to superintend the work.

The Wick Town Council have agreed to petition the Secretary for Scotland to promote a grant of 50,000*l.* for a harbour at Gill's Bay, in the Pentland Firth, and a branch line railway from that place to Wick, a distance of about seventeen miles.

The Competition for laying out the Corbett estate, Towyn-on-Sea, has ended as follows:—1st, Mr. W. Dunbar, C.E., Rhyl, 100*l.*; 2nd, Mr. James B. Hipkins, architect, Liverpool, 30*l.*; 3rd, Messrs. Veal & Sant, architects, Cardiff, 20*l.* There were sixty-two designs sent in.

The Architect.

THE WEEK.

THE Sheffield School Board have decided to purchase the Wentworth Café in Holly Street for 3,875*l.*, and thus the whole block of which the Firth College and Central School form a part will belong to the town. The Central School is to be enlarged, plans by Mr. J. MITCHELL-WITHERS having been adopted. The additions will comprise rooms for cookery classes, dining-rooms, joiner's shop and metal-working shop and laundry; machine drawing and lecture-rooms, to accommodate 120 students; physical laboratory and lecture-room for 50 students; chemical laboratories for 140 students, and lecture-room, balance-room and other necessary stores. There will be also an elementary school building at the corner of Holly Street and Bow Street, with accommodation for 292 infants on the ground floor, and with a mixed school for 250 on the first floor. A playground is provided on the top of the building and the basement is devoted to workshops and playsheds.

AT the Manchester Assizes, Mr. W. HORROX, of Stockport, sued Messrs. FAULDER & Co., Limited, for 550*l.*, amount of fees as architect. In January 1890 the defendants began to build a factory at Heaton Norris, and the plaintiff, who was then in the employment of Mr. HARKER, and had experience of such buildings, was engaged as clerk of the works at a salary of 200*l.* for the first year. The plaintiff's case was that in March he was asked by the defendants to undertake the duties of architect. The sum the plaintiff was to receive for superintending the erection of the building was not exactly stated, but it was to be a reasonable remuneration above his salary as clerk of the works. This the plaintiff now fixed at 5 per cent. on the cost of the building. The defence was that the plaintiff had not been asked to undertake the duties of architect and had not performed them. The jury found a verdict for the plaintiff for 150*l.* In cases of this kind it is well to have the arrangements in writing, but apparently both sides avoided definiteness, and trusted to the chapter of accidents to bring about a satisfactory ending.

SIR HENRY ROSCOE has prepared a report, in which he gives the results of some experiments made by him with regard to the possibility of freeing the air supply of the debating chamber of the House of Commons, not from particles of dust and fog, which has already been accomplished, but from the floating germs which are constantly present in the air. These germs, generally attached to particles of dust, were unable to pass through a dry and firm plug of cotton wool, the fibres of which would filter out the most minute particles. The first series of experiments were designed to ascertain the number of germs falling on a given space in a given time. For this purpose flat covered glass dishes containing a film of sterilised nutrient gelatine were exposed. The invisible germs fell on and were retained by the moist film of gelatine, and finding a material suitable for their growth developed with rapidity, so that after an incubation of several days, colonies of various sizes made their appearance. Aerial germs consisted of two kinds, moulds and bacteria, and it was easy by mere inspection to distinguish colonies of the one from those of the other. Experiments were made on Thursday, February 26. The ventilating fan was running, and the air had been filtered for half an hour. During the exposure of the plates the fan was stopped. The air was examined, and the result showed —first, that there was a larger number of germs in the air of the terrace than in the air of the chamber before filtration; and, secondly, that after filtration the number of germs had greatly diminished. For the second, third and fourth series of experiments (February 26, May 26 and May 28) the fan was running a further three-quarters of an hour and then stopped for the exposures. By these the result obtained from the first series was decidedly corroborated. The next object was to ascertain the actual number of germs floating in a given volume of air. For this purpose a measured quantity of the air was drawn by means of an air-pump through a sterilised plug of glass wool upon which the germs were deposited. This plug was afterwards so treated that each single germ formed a visible colony, and then the number of these could be easily counted. It was again very strikingly shown that a large reduction of the number of germs takes place in the air after filtration. The most satisfactory method was that known as HESSE's method, by which the measured volume of air was drawn through a long tube coated internally with sterilised gelatine. From other experiments it was found that the filtered air contained very few germs, and these had either escaped filtration, or more probably were due to the accidental entrance of unfiltered air or dust particles in the vault beyond the filter. The results of the experiments as a whole proved that the filtration of the air on a large scale could practically remove all the floating aerial germs. The effect of filtration upon the air within the chamber itself had yet to be ascertained.

LIVERPOOL is far from being a model of sanitation, and few that are acquainted with the condition of the city will be amazed when they learn that the medical officer of health has just condemned certain property which is owned by the Corporation. The houses are to be found in courts in Cable Street, Brook Street, Worfield Street, Levesley Place, Ennerdale Street, Lower Milk Street, Back Bridport Street, Bolton Street, Roscoe Street, Upper Frederick Street, Cookson Street, Blundell Street and Newhall Street. There are a great many houses described as being unfit for human habitation. The gravity of the charge is not easily to be got over, and the Finance Committee acted discreetly in intimating that they will be prepared to treat for the sale or demolition of any property which may be included in any report of the medical officer of health made in pursuance of the Liverpool Sanitary Amendment Act, 1864, or any statute or order amending the same. The medical officer of health says that when making reports he does not know who are the owners of insanitary property, nor does he consider it advisable that he should.

THE people of Glasgow are to be envied for the abundance and purity of the Loch Katrine water supply, but they occasionally forget that there are limits to the quantity that is obtainable. The normal yield of the lake is 40,000,000 gallons, but for some weeks about one-fifth more, or 48,000,000 gallons, have been consumed. It is supposed that the excess is wasted. Not only is the amount of storage water diminished, but it is evident that, in proportion as the depth of water in Loch Katrine is reduced, the height to which it can be supplied in the city is also reduced. In a case of the kind the difficulty is not to be got over by any effort of the Water Commissioners or their engineers. The prevention of waste rests with the citizens, and it is their interest to see that water is not allowed to be wasted. From the great pressure, a smaller quantity of water serves for flushing in Glasgow than in London, and it is therefore absurd to imagine that for sanitary purposes the water should be at all times running in the houses.

THE amount of money received for admission to the exhibition in the Champ de Mars will be gratifying to the members of the Société Nationale des Beaux-Arts, but it will be a surprise to many visitors, as the galleries were rarely crowded. Last year, when the affair was a novelty, 172,445 francs were paid; this year the sum has been elevated to 212,740 francs, thus showing an increase of 40,295 francs. It is not easy to comprehend the nature of the attractions which induced so many people to visit the place. Can it be the proximity of the Eiffel Tower? The large sum received will, however, enable the committee to pay off a part of the debt incurred for curtains, carpets and couches. There will also be money available for the travelling studentships. Next year the Society will be enabled to start with renewed confidence. The Parisians may not consider the works exhibited as masterpieces, but they can applaud a revolt, and are not unwilling to inflict a little punishment on the men who have brought discredit to France by following a course of meddling and muddling in the Salon for many years.

ALFRED STEVENS AND HIS WORK.*

EVERY biographical dictionary is partly made up with accounts of men and women who have appeared in this world under conditions that are surprising, because they denote indifference or neglect. In their cases we seem to see departures from the operation of that law of fitness or correspondence between things which is supposed to be necessary for the upholding of the world. Nature, Destiny, Fate (or whatever name we give to a power we cannot understand) appears to have cast such beings into the world with no more regard for their value or precautions for their growth than was used by the sower when he let seed fall by the wayside, upon the hard stones or among the thorns. One of the most puzzling of those cases, in which genius appears to be of as little value as the grain which the birds of the air carried off, is that of ALFRED STEVENS. Considering the marvellous extent of his capacity, and the little use he was permitted to make of it, he must be classed among the failures; in spite of all the fertility with which he was endowed, he was not destined to follow the natural law and display himself in sufficient amplitude. Yet hereafter, when he can be judged at a proper distance, it is likely to be said that STEVENS was precisely the one artist that was most needed in England in this nineteenth century, and, if rightly appreciated, his appearance was as a blessing to the land. He came among the people he was to enlighten and delight, and, as often happened before with similar precursors, he was rejected. As he must have felt that he was not as other men, is it to be wondered that he should sometimes lose confidence in his powers when he found he was unable to win the approval which was lavished on artists who were so much inferior to himself?

The peculiarity of STEVENS's gifts increased his misery. A man who is born with great power of expression need not be silent until he can control a senate or command a theatre. He can convey his thoughts in the form of a sonnet or a song ; he can make a few pages immortal ; and if books are unknown he can become a rhapsodist and thrill the market-place, or he can go into the desert and, were he frail as a reed shaken by the wind, it will be found that men will follow to listen to him. An ordinary painter or sculptor also can discover many ways to entice support from individuals who commonly are indifferent to everything that relates to art. STEVENS, on the other hand, was never intended by nature to minister to the luxury of one man or a few. For a society properly constituted he was essentially the artist who could express in stone or metal or other enduring medium the thoughts and aspirations that were general; he could become a creator of public memorials, a bestower of fame; and he would be treasured as a sympathetic man in whom nothing was circumscribed, and who could display his justice in imparting beauty to the smallest as to the largest things. STEVENS was such an artist as the American desired for the new city, one who would—

> Give to barrows, trays and pans
> Grace and glimmer of romance ;
> Bring the moonlight into noon
> Hid in gleaming piles of stone ;
> On the city's paved street
> Plant gardens lined with lilac sweet ;
> Let spouting fountains cool the air,
> Singing in the sun-baked square ;
> Let statue, picture, park and hall,
> Ballad, flag and festival,
> The past restore, the day adorn
> And make to-morrow a new morn.

For work so various STEVENS was adequate. To his mind there was only one art, but it comprised every way in which beauty could be imparted to form. Supply him with materials and a great theme, one that would interest humanity rather than parishes and coteries, he could produce a masterpiece, but compel him to go into the market and sell his art, STEVENS became the weakest of mortals. He might be penniless, but could not haggle, and the conditions under which buying and selling have to be carried out, no matter how sounding may be the terms used to describe them, were to him, in connection with a work of art, as much a sacrilege as trafficking in a temple. Everything appeared sordid which in any way affected his idealism or narrowed the sphere of his thought, and, as he imagined, gave a material character to his art. His indifference to gain made people think he was not qualified to be trusted with important works. There is no room in England for men who are not adapted to become units in a crowd or parts of a great industrial machine, and in consequence STEVENS, who was one of the rarest of spirits, who was endowed with natural gifts beyond any of his contemporaries, and for whom art retained much that recalled its divine origin, was tested by the rules that are most applicable to tradesmen. We may be all thankful that he did not correspond with them, but in a country where the maxims of business are omnipotent, it is no wonder he was set aside like an unqualified practitioner.

A judgment obtained under such circumstances, and which is thoroughly British in conception, is not easily reversed. When people think of STEVENS he appears before them as a very weak mortal whose imagination was greater than his executive power, who was wanting in system, and therefore caused trouble to many deserving people, as a man who had only partially and by accident gained a rather prominent position which he was incompetent to hold. Mr. HUGH STANNUS, one of the most prominent of STEVENS's pupils, through whose devotedness and talents the artist was protected and aided in his last years, has at length succeeded, after years of loyal endeavour, in bringing together the materials which are best adapted to convince Englishmen of the unsoundness of the fallacies on which their opinion of STEVENS is based. Through the goodwill and liberality of the Autotype Company a volume has been produced which forms as becoming a memorial of the artist as his most ardent admirers could desire. The selection from STEVENS's works, forming the subjects of the plates, will convince the most sceptical of his genius, and the strength and elasticity it acquired by long years of self-imposed discipline. Mr. STANNUS's memoir follows the course of the artist's life from year to year, and reveals much which hitherto was unknown to the public. He must be unfairly prejudiced who, after reading what is said by Mr. STANNUS, is not able to understand the character of the artist, and to make allowance for defects which arose from the monopolising influence of his art.

Mr. STANNUS, in describing some of STEVENS's characteristics, wisely says, "'A mere copyist of MICHEL ANGELO,' he has been sometimes termed. This exhibits a failure to apprehend the law of evolution. MICHELAGNOLO was not the end of everything, but a link—a step in the procession. Undoubtedly, without that of the Florentine, the work of STEVENS would have been less or later ; each great man, as every small one, is the result of every great man before him ; but while the small man can only follow the light that shows the path, each great man, in succession replenishing the lamp, causes it to shine more brightly through the centuries. So with the master, and we may be glad and grateful that to our English-speaking race, in this happy reign, has been granted among other advantages the influence of ALFRED STEVENS." There is no error in thus making STEVENS one of the light bringers of humanity, nor is it presumptuous to suppose that he was strong enough to uphold the lamp that was borne by the mighty hand of the Florentine. The fact is, STEVENS could not have succeeded even within the limits imposed on him if he did not possess a strength that was exceptional.

He was born in 1818 in the little town of Blandford Forum, in Dorset, which is one of the last places where one would seek for a successor of MICHEL ANGELO. His father was a house-painter and decorator, his mother a farmer's daughter. Young STEVENS was taught in the local school, but before he was eleven he was obliged to help his father. He was fond of copying pictures and engravings in those early days. One, taken from the print of the *Storming of Seringapatam*, was rescued from a public-house, where the father had left it in settlement of a drink score. Everything indicated that STEVENS was destined to resemble a great many youths in country towns, and to be no more than an useful operative who would be competent to aid in local work. But fortunately the boy was not disposed to accept life under such conditions.

* *Alfred Stevens and his Work.* Being a collection of fifty-seven autotypes, with a brief memoir and account of his principal works so far as they are known. By Hugh Stannus. London : The Autotype Company.

The rector of a neighbouring parish, the Hon. and Rev. SAMUEL BEST, happened to see STEVENS's copies, and lent him pictures, which were better than engravings as exemplars. An effort was made to obtain training for him under an artist. LANDSEER, however, wanted 500*l.*, and as only 60*l.* could be raised, it was decided to send STEVENS to Italy, where he might attain perfection by copying the works of SALVATOR ROSA! Let us remember that the arrangements were made in 1833, when everything relating to art was supposed to be a mystery, and it will not therefore surprise us if the transaction reads like a chapter from the "Vicar of Wakefield."

It did not take long before STEVENS perceived that the Dorsetshire connoisseurs were not wise in their admiration of the Savage ROSA, and in Naples he was first impressed by the grace seen in the works of ANDREA DEL SARTO, and then he worked hard in copying examples of other schools. In Pompeii he was able to see beautiful decoration, and his first year was profitably spent. But Rome was the goal of the enthusiast. He tramped the long road "with such help as a lift on a vetturino afforded, and staying at wayside locande, where he made portraits in pencil with colour washed over (to fix the pencil and give a little tint) for his lodging." At a time when everybody was conspiring, he could hardly escape being made a dupe of crafty men. It seems probable that, like many others, he was disappointed when he reached Rome, for after a short time he turned his steps toward Florence. There he spent three years with profit. He copied old masters for a living, and discovered many a secret in the work. He was tolerated as a sort of unattached student, who had ways of his own. That he inspired confidence is evident, for we are told by Mr. STANNUS that "when the French workmen made their plaster moulds from the Ghiberti Gates, by permission of the Austrian Government, the boy acted as representative of the latter." Young as he was, he was strong enough to resist the fascinations of any master, living or dead. Wherever there was good work to be found he sought it, and earnestly tried to enter into its spirit. His copies from TITIAN's pictures in Venice were so much akin to the originals that some have supposed he passed off old Italian copies as his own. He studied ornament under ALBERTOLLI at Milan, but the lessons only served to develop his own manner. He was employed as an assistant by THORWALDSEN, and expressed himself as grateful to the Danish sculptor, but however he might admire his classicism, STEVENS was not to be induced to forego the methods and the spirit which in some mysterious way he appeared to inherit from the artists of the Renaissance.

For it could be said of STEVENS that he came nearer to an ideal completeness than any one of the great men of the fifteenth or sixteenth century. There was to be found in him something that recalled MICHEL ANGELO, TITIAN, BENVENUTO and PALLADIO, besides qualities that they did not possess. He was no representative of one school or period, but rather an artist to whose strength Italy in its fulness had contributed. The misfortune was that he had done so little with a view to the actualities of life. The same simplicity which disregarded cause and effect by the selection of SALVATOR ROSA as a guide followed STEVENS during his course. He sought bravely after power, and he succeeded in making himself competent to undertake commissions for painting, sculpture, architecture or whatever variety of art was needed, for to him art was only a sort of universal language which he had mastered in all its parts; but this surprising force had to be taken on trust. He brought with him nothing that was marketable. He acted as if his business was to become competent, and the rest was to be undertaken by providence. The old race of English patrons that benefited men like himself during their travels was extinct, and when, after his seven years of exile, he landed at Southampton, he was as much of a stranger and as poor as when he left. There were no offers awaiting him, and he was compelled to borrow the small sum that was necessary to transport him to Blandford. All his intercourse with Italians had not taught him worldly wisdom; he found himself less useful among his countrymen than among strangers, and for a time it seemed as if art was only an illusion by which he was to be led astray.

What so sensitive a genius must have suffered in the little room of the humble house at Blandford can only be guessed. "He is described," says Mr. STANNUS, "as being at this time very reserved, though courteous to his few intimates, and as not joining in any of their country sports. He stayed indoors all the day, coming out in the evenings." It soon became evident that the most weary days and nights, if passed in Blandford, could not help him to commissions. He was fortunate in finding a friend who lent him his savings, amounting to 40*l.*, and with that help he found his way to London in the beginning of 1844. The time was considered as opportune. A new era for artists like STEVENS appeared to be opening. The walls of the Houses of Parliament were to be decorated, and from all that was said on the subject it might easily be imagined that it was the bounden duty of loyal citizens to make fresco supersede wall-paper in public and private buildings. STEVENS exhibited a specimen of fresco-painting. He began a picture of the *Brazen Serpent*, and another having for subject an incident in the life of FRANCESCO MAZZUOLI, which, with other things, show that he did his best to prove he was a man for the time; but nothing came of all his efforts. He suffered much misery, and at length was glad to accept an appointment in the School of Design at Somerset House, his salary being 150*l.* a year.

He had the quality of qualities for such an office, for his worth was manifest to the keen-eyed students. They could see the giant was compelled to drudge, and yet bore his suffering meekly. They found that an observation from him was worth a course of lectures from others. But the school was admittedly an experiment, and as the whims of Government clerks were the moving power, hardly a week passed without a change. A prejudice against the English circumlocutory system was bred in STEVENS's mind while he was in Somerset House, and in after days it helped to increase the friction in his dealings with Government officials. Like all men who prefer art to their own interest, he was an inspiring master, but after two years' experience of clerks as controllers STEVENS was compelled to abandon the school and to seek an income in other ways.

By slow degrees he was able to persuade a few people that modesty and merit could go together. Sir ROBERT PEEL gave STEVENS a commission for decorative work, and a sketch of part in the volume might be taken as a design by RAPHAEL. He worked at the panels of the Fitzwilliam Museum under COCKERELL, but "nothing now remains which could have been done by him." He painted some panels at the mansion of the BLUNDELLS near Liverpool. Mr. STANNUS says they were executed in less than one day each; "they were sketched on the walls in red chalk, and thinly painted in PARRIS's medium, without models of any kind, which latter fact may account for the peculiarity of the crination; they have the same quality, of quick unerring work, as the Attic vases, and may be judged by the same canons." He designed a railway carriage for the King of DENMARK. From COCKERELL's suggestions he made a drawing of the sculpture for St. George's Hall, which could hardly be surpassed as a specimen of delicate brush-work.

His most important commission after leaving Somerset House was for the gates of the Geological Museum, which unhappily came to nothing through over-eagerness to justify his selection. Mr. STANNUS says of this work:—"Had this noble design been carried out, the world would possess a model in the art of relief; but, alas! through no fault of the authorities, this is not so. He had received the commission in 1846, and shortly afterwards an instalment on account, and his intention was, when engaged, to go to Sheffield to model the panels in his leisure, and have them cast at the foundry, but owing to his fastidious taste and besetting procrastination this intention went where so many others have gone before and since, and the design exists only in the beautiful drawing at South Kensington."

The mention of Sheffield suggests one of the most fruitful periods of STEVENS's life. In 1850 there was preparation for the universal contest in Hyde Park. He was persuaded to give his aid to Messrs. HOOLE, of Sheffield, stove-makers, and with the aid of his assistants, Mr. HOYLES, Mr. SYKES and Mr. TOWNROE, he produced designs which were "astounding for the time," and "caused a new development in bronze and iron." STEVENS's treat-

ment was an innovation, for, says Mr. Stannus, "he introduced into English manufacture the method of placing plates of bright brass behind castings in grey iron, thus adding colour and emphasising the beautiful relation between the ornament and the interstices in which he was unapproachable. The practice of parti-colouring in modern English work was reintroduced by him. A development of his mind is to be observed in their succession from the more architectural forms introduced into the former to the freer style of the later stove fronts, but the whole are admirable in the restraints they evince." Mr. Stannus's wide experience in production enables him to point out with exactitude the worth of Stevens's co-operation with manufacturers. There is much more relating to the technical work of the designs which we should like to copy, but we have already, we fear, exceeded equitable bounds. Stevens's power in Sheffield manufactures is not to be measured by the profit derived from his designs. It is a matter of history that in the art school he renewed the fascination which was proved at Somerset House. Mr. Stannus says that "though he had no official connection with it, Stevens often went and gave words of counsel and encouragement to such of the elder students as seemed desirous of learning. He had a quick, piercing eye, and a most winning smile, and the sweetness of his voice and manner had great influence over them."

The works after Stevens's designs upheld the reputation of England in the Exhibition of 1851. They proved that what the country wanted was not manual skill, but the co-operation of artists whose designs did not require manipulation by unworthy hands. Stevens from the first would not allow himself to be fettered, and the manufacturers gained by accommodating themselves to him. But it was not always easy to convince men of the advantage of the arrangement. We are persuaded that much of the unhappiness of Stevens's life arose from the conviction that the relations between modern industrialism and art resolved themselves into a sort of game of give-and-take, in which a man like himself was likely to lose all individuality. He could not produce designs and be indifferent to the freedom used in adapting them. He became testy, delayed drawings as if to prevent any operations on them by other hands, and met statements of the inconvenience he was causing by saying, "If I do the work I must do it in my own way and at my own time." Stevens, with all the readiness he derived from the study of examples, was also a believer in inspiration. He was competent to design things on the spur of the moment, but he knew that in some mysterious way forms suddenly arise in thought which are better or give more pleasure in realising than those which are created by system. He was eager for the sake of art to give the best, and therefore was to be excused when he did not display the promptitude of a machine. So much fastidiousness could not be understood at a time when art was supposed to gain much from its alliance with manufacturers, that is, with machinery, and the work obtained by Stevens in the years which followed the Great Exhibition was not commensurate with his success in the contest. In Mr. Stannus's account the unexecuted designs predominate.

The competition for the Wellington Monument in 1857 offered to him the first opportunity in which he could display all his strength, and he entered into it with an earnest heart. During the eight months of preparation "he was often at the board or the banker till past midnight, and up again at daylight to resume." However, owing to his earnestness to attain perfection, it was only at the last prescribed moment that his model reached Westminster Hall. In the first competition he was rewarded with one of the five prizes of a hundred pounds each, but the judges candidly confessed they did not consider the fitness of the models for the site proposed. Afterwards a model of the arch was made and applied to each of the premiated designs, when it was discovered that Stevens's alone was suitable to the site. In consequence, he was entrusted with the commission.

What followed is one of the saddest stories in the history of art. It is often supposed that all the suffering which Stevens was compelled to endure should be attributed to official meddling. But Mr. Stannus, who knows more of the circumstances than any other man, declares that the Prime Minister, the Chancellor of the Exchequer, and even the First Commissioner, "were all friendly and considerate towards the master." He continues:—"Much has been written about persecution of the sensitive artist. He did, indeed, writhe under the hydra-like difficulties which commenced with the trial model. But, if there were loss of time and money, the responsibility may fairly be attributed to the unintentionally hard initial stipulation, incautiously agreed to and expensively carried out by the sanguine artist, as much as by the blundering good intentions of the Government official who sought the efficiency of the public service." That is an impartial view of the case, and should determine it for ever.

Stevens was too absorbed by his art to devote any attention to other interests, although they were vital to himself. He saw what appeared to be a large sum of money at his disposal; his own requirements were modest, and it seemed to him that after all expenses were paid there must be a surplus. He believed that the amount was fixed by experts with more experience than himself, and it did not strike him until it was too late that originally there was no intention of providing a most costly model, which was only proposed as a measure of security against himself. It was Stevens's desire to make the monument worthy of Wellington and of England, and the very excess of his eagerness caused him to look too precisely at details. The most ardent admirers of the artist must admit disappointment every time they contemplate the work. Even Mr. Stannus is compelled to see the shortcomings, and however painful to himself may be the task of appearing as the improver of the work of such a artist for the sake of Stevens's memory, he suggests alterations, which he says if the trial model had been placed in the Cathedral would have commended themselves to the master's judgment. The monument suffers under the drawbacks of being incomplete, for it is shorn of its most important feature, the equestrian statue, and of being placed in a position where it cannot be properly studied; but the authorities would also do well to attend to Mr. Stannus's suggestion for a rearrangement of some of the parts.

Another example of Stevens's sculpture is seen in the chimneypiece of Dorchester House. The figures appear as if he wrought in emulation with Michel Angelo, and, as may be said of all noble sculpture, the lines are an inexhaustible study. In the owner, Mr. Holford, the artist found the most forbearing of patrons, but, although there seemed to be no limit to the allowances he was prepared to make for the waywardness of genius, he was compelled, after waiting for years, to put up with work that was incomplete. Stevens's life suggests the sad reflection that nature sometimes creates men who are destined to be imperfect unless they are controlled; left to themselves their days and works become only fragments.

But with all the shortcomings of Stevens's life, what a legacy has he left to his country! In the splendid plates which are found in the volume that is devoted to his memory, we can see not only a record of his most complete work, but of designs in which the longing of his mind for beauty of line and composition is manifest. There is work shown which might be described in the words of Shakespeare, that are expressive of so much in Renaissance art, "So lovely fair that the sense aches at it." And so many of the designs, too, excite our pathos, for we know that with all his aspirations and striving they were not destined to be matured, but were to remain for ever as if they were only shadows cast by glorious forms on paper. Happily, Mr. Bird and the Autotype Company have given them some permanence.

This volume is no ordinary example of enterprise; if profit only were considered it would never see the light. The more credit is therefore owing to those who have taken part in its production. It may not be possible for all students of art to acquire it, but we should like to see them subscribing in order that all the principal art schools in the country should be enriched with a copy, and in that way the influence of Stevens would be extended beyond the present time. Amateurs will need no recommendation to obtain copies. Both students and amateurs must acknowledge their indebtedness to Mr. Stannus, who has so reverentially and earnestly guarded the reputation of the master he faithfully served during life.

THE METROPOLITAN BUILDING ACT.

ONE section of the annual report of the London County Council deals with the work of the Building Committee. It states that the committee has held forty-one ordinary meetings during the year, twelve sub-committee meetings, and during the vacations three meetings, with special powers. The following statement is designed to show in popular form the position of the law, both before and after the amendment of the Building Act :—

The number of plans approved by the Council under the provisions of the Metropolitan Building Act is very large. Previously to the new Act being passed, the approval of every such plan had to be signed by the chairman of the London County Council. Provision is now made for plans and particulars of buildings being signed by the chairman of the Building Act Committee or by some other person to be appointed for that purpose by the Council.

By the 75th section of the Metropolis Management Amendment Act, 1862, the superintending architect of the Council for the time being is empowered to determine the general line of buildings in any street in the county, and it had been decided by the House of Lords that there was no appeal from his decision. This state of things was felt to be anomalous, and to be likely to occasion discontent. Any persons dissatisfied with the decision of the superintending architect in regard to the general line of buildings can now appeal to a tribunal to be constituted as provided by this section, viz. one member to be appointed by the Council, one member to be appointed by the Council of the Royal Institute of British Architects and one member to be appointed by the Council of the Surveyors' Institution.

Buildings to be used as warehouses, or for trade or manufacturing purposes, could not be erected of greater dimensions than 216,000 cubic feet without party walls, except as regards certain manufactories for machinery and boilers of steam vessels. This was found to be unduly restrictive, as the exigencies of modern trade necessitate in many cases the erection of larger buildings. Authority is given to the Council by this section to permit in certain cases, and subject to the adoption of special safeguards against the danger from fire, the use of buildings of greater dimensions than 216,000 cubic feet, but not exceeding 450,000 cubic feet, without being divided by party walls.

The rules as to the distance at which every building should be placed from the "centre of the roadway" of the road in front of the same led to anomalies and inconveniences owing to there being no definition of the expression "centre of the roadway." Thus, when buildings were erected on one side of a roadway, say 30 feet wide, they had to be set back 5 feet (so as to be 20 feet from the centre). The boundary of the roadway would then be on the one side 20 feet, and on the other side 15 feet from the old centre line, and the actual centre would have become 17½ feet distant from the boundary on each side, instead of 15 feet, as it was at the time when the opposite buildings were erected. The owner of the building land on the opposite side of the road could then comply with the law by widening the roadway to an extent of 2½ feet only instead of 5 feet, as had been done by the owner who first built. This provision not only led to unfairness as between opposite owners, but also failed to effect the real intention of the Act, viz. that streets should be at least 40 feet wide throughout. The new section is designed to remedy these inconveniences by enabling the Council to fix once for all the line constituting the centre of the roadway, and to prevent new buildings or the forecourt boundaries of the same being placed within 20 feet of that centre on either side of the road.

No adequate power was possessed by the Council of making by-laws for sanitary purposes in connection with buildings, and whilst the Council and their predecessors, the Metropolitan Board of Works, could make regulations in regard to the mortar to be used in the construction of the walls of buildings so as to secure its being of wholesome and proper quality, the Act did not permit of the Council exercising any control with regard to plastering, and complaints were frequently made of improper materials being used for plastering which the Council had no power to prevent. A further difficulty was experienced in consequence of the inability of the Council to prevent excavations in close proximity to buildings being filled up with insanitary refuse.

The Council is empowered by this clause to make by-laws as to—1. The description and quality of the substances of which plastering is authorised to be made. 2. The mode in which and the materials with which any excavation made within a line drawn outside the site of a house, building, or other erection, and at a uniform distance therefrom of 3 feet shall be filled up. 3. The duties of district surveyors in relation to such plastering or excavation, and the regulation of the amounts of the fees to be paid to such district surveyors in respect of the duties imposed upon them by any such by-laws.

No adequate provision has hitherto been made for securing the erection of hoardings and platforms for the protection of the public in cases where buildings abutting on public thoroughfares were being demolished. The new clause will necessitate the erection of proper hoards, fences, platforms and handrails before any building within 10 feet of a public thoroughfare can either be built or taken down.

Questions have frequently arisen under the existing enactments, and these questions have in several cases been discussed at considerable length in the courts as to whether a building at the corner of two streets should follow the general line of buildings in the street other than that in which the building was situate. To set these questions at rest, and to prevent the disfigurement which is now occasioned through buildings on corner plots being placed in advance of the general line of buildings in side streets, the Council has obtained power to control the main and side frontage of buildings so situate in streets hereafter to be formed. Although the exercise of the power conferred by this section is subject to restrictions, it is hoped that the observance of the general line of buildings in such cases will be secured. This section was considerably weakened by the action of the Royal Institute of British Architects.

Although new buildings could not be placed at a less distance than 20 feet from the centre of a public carriageway, or 10 feet from the centre of a public footway, it was doubtful whether the extension of buildings so situate could be prevented. This clause is intended to remove all further doubts as to the illegality of extending any building, so that any part of the external wall of such extension shall be within 20 feet of the centre of a public carriageway or 10 feet from the centre of a public footway.

The law intended to secure the free and open intercommunication of streets was liable to evasion owing to the definition of the term "street" in the existing enactments, which includes any road or passage, whether a thoroughfare or not. Streets therefore could be formed which were not available for through vehicular traffic, as they might communicate at one end with a street of the statutory width and at the other with a narrow passage-way only. The new enactment will prevent streets being thus laid out unless with the consent of the Council.

The Metropolitan Building Act contains no limitation as to the height to which buildings in the county of London may be erected, and special attention was directed to the subject in consequence of the great height to which certain buildings had been carried. It was felt that buildings could not be so carried up without damage to adjoining buildings, and that the danger in case of fire was thereby greatly increased. The new enactment was strongly opposed on behalf of some of the large estate-owners in the county, and, to the surprise of your committee, by the Royal Institute of British Architects ; but, in spite of this opposition, a usefully restrictive clause has been passed. It does not, however, give the Council quite so much control as your committee had thought desirable ; at the same time the enactment will prevent the erection, without the consent of the Council, of buildings of an excessive height.

The Treasury first required that all Crown property and buildings occupied by Government departments should be exempt from the provisions of the Act. The section, however, as passed, exempts Crown and Government buildings vested in and occupied by Government departments only, but it does not exempt ordinary houses built on Government property. The committee has already found the value of the above amendments in the law in a large number of cases.

District Surveyors.

For the purposes of the Building Acts, the metropolis is now divided into seventy-four districts, each superintended by a district surveyor, whose duty it is to see that all erections and all additions and alterations to buildings are carried out in accordance with the law.

The following is a summary of the monthly returns of district surveyors for the year ended December 1890 :—

Works.	Building operations.	Fees.
New buildings in respect of which fees were received	6,618	£15,449 15 2
Additions and alterations and other works in respect of which fees were received	11,494	15,077 0 4
Arrears—		
New buildings	2,152	5,101 8 10
Additions and alterations	2,111	2,808 10 6
Total works and fees thereon during the year ended December 1890	22,375	£38,436 14 10

The committee submitted the following regulations with respect to new appointments of district surveyors, and they were approved by the Council :—No person shall be accepted as a candidate for the appointment of district surveyor unless he shall have attained twenty-eight years of age and be under fifty

years of age, and every such candidate shall deliver with his application satisfactory evidence of his age. Every candidate shall be required to sign a declaration and deliver it with his application that he becomes a candidate and will accept the appointment if he should be appointed, on the following understanding:—(*a*) That he will personally discharge the duties of his office subject to section 35 of the Metropolitan Building Act, 1855. (*b*) That he will give his whole time to the duties of his office. (*c*) That he will not during his continuance in office (except in the discharge of the duties thereof) carry on business as an architect, surveyor or builder, or directly or indirectly as a partner or otherwise be interested in such business. (*d*) That he will furnish the Council with information of those cases in his district in which the orders of the Council or the requirements of the Metropolis Local Management Acts with regard to the width of streets, or to any building, structure or erection or projection therein beyond the general line of buildings are not complied with. (*e*) That he will make no claim for compensation in case a diminution of his income shall at any time hereafter arise. (*f*) That he will keep his district office open from Monday to Friday (both inclusive) between the hours of 9.30 A.M. and 5 P.M., and on Saturday from 9.30 A.M. until 2 P.M., and give his personal attendance there daily from 9.30 A.M. to 11 A.M., and (except Saturday) from 4 to 5 P.M. (*g*) That he will retire if required to do so on attaining the age of sixty-five, or at any date subsequent to his attaining that age. The declaration of the appointed candidate shall on his appointment be entered on the minutes of the Council. The districts are to be rearranged by the committee as opportunities may occur, so that the average of the fees received may in no case amount to less than £500 per annum.

Formation of Streets.

The duty of regulating the width of roads, streets and pas sages devolves upon the Council under the provisions of the Metropolis Management Amendment Act, 1862, Sections 98, 99 and 112, and the Metropolis Management and Building Acts Amendment Act, 1882, Sections 6, 7 and 8. A width of 40 feet is required for streets intended for carriage traffic, and 20 feet for footways. The Amendment Act of 1878 forbids the erection of any building, without the written consent of the Council, in such a position that its external wall or forecourt boundary shall be within 20 feet of the centre of a carriageway or 10 feet of the centre of a footway. Applications were received for approval of 109 plans for the formation of new streets, of which 43 were granted. For consent to the erection of buildings at less than the prescribed distance from the centre of the road 33 applications were received, of which 10 were granted. The total length of the new streets sanctioned by the Council during the year exceeds 12 miles.

Lines of Frontage.

The consent of the Council is required under the 75th Sec tion of the Metropolis Management Amendment Act, 1862, fo the erection of any building beyond the general line of frontage in any street or row of houses within 50 feet from the highway. The 26th Section of the Metropolitan Building Act, 1855, also renders the previous consent of the Council necessary in cases where it is proposed to construct porticoes, balconies or verandahs. The Council has during the past twelve months received 365 applications for the erection of buildings beyond the general line, of which 184 were granted. For the construction of porticoes, balconies and verandahs 188 applications were received, of which 141 were granted.

The committee, in its recommendations as to bay windows, balconies, &c., and the use of external woodwork, has endeavoured, with a due regard to the public safety and convenience, to interfere as little as possible with the architectural character of the proposed buildings. In case of question the general line of buildings in a street must be decided by the superintending architect appointed by the Council under the Building Act, subject to appeal under section 28 of the London Council (General Powers) Act, 1890. Thirty-four decisions were given by the architect under the 75th section of the Act of 1862 during the year.

Special Buildings.

The Council has authority under the 56th section of the Building Act, 1855, to sanction special erections to which the rules in the Act may be inapplicable. The Council is also empowered to control the erection of movable and temporary buildings or structures, and to limit the time for the use of the same under the 12th and 13th sections of the Metropolis Management and Building Acts Amendment Act, 1882. During the year the following cases have been dealt with:—1. For iron buildings constructed for temporary and other purposes 52 applications were granted and 33 refused. 2. For wooden buildings 32 applications were granted and 11 refused. 3. For the continuance of temporary buildings 102 applications were granted. 4. For open sheds and drying sheds 18 applications were granted and 4 refused. 5. For warehouses and other buildings with large openings 2 applications were refused. 6. For furnace chimney-shafts for breweries, distilleries and other buildings used for manufacturing purposes 57 applications were granted and 15 refused. 7. For overhanging eaves to dwelling-houses and other roof constructions 10 applications were granted and 1 refused. 8. For covered ways, projecting water-closets and other rear projections 16 applications were granted and 11 refused.

Naming of Streets and Numbering of Houses.

The Council is empowered by Section 87 of the Metropolis Management Amendment Act, 1862, to give names to new streets, to alter the existing names and to renumber houses within the metropolis. A survey of the locality is always made and a plan prepared showing the situation and number or name of each house for future reference and identification of the property. During the year the Council has abolished 468 subsidiary and other names of streets, and rearranged the numbers of 9,362 houses; it has also approved of 85 names of new streets and ordered the renaming or renumbering of 259 streets.

The duty of carrying out the orders of the Council devolves upon the vestries and district boards. By the 5th section of the Metropolis Management and Building Acts Amendment Act, 1882, the Council is empowered, in case of default by any vestry or district board, itself to carry out the orders at the expiration of three calendar months. A register of alterations is kept, and extracts are supplied for legal and other purposes; 1,054 certificates were issued during the year. A return of alterations in street nomenclature and house-numbering has been printed to December 1890.

Neglected Structures.

By the 17th section of the Metropolis Management and Building Acts Amendment Act, 1882, it is provided that where a structure is ruinous, or so far dilapidated as thereby to have become unfit for use or occupation, or is from neglect otherwise in a structural condition prejudicial to the property in or to the inhabitants of the neighbourhood, the Council may make complaint thereof to a magistrate; and should such complaint be substantiated, the magistrate may order the owner to take down or repair the neglected structure to the satisfaction of the Council. In pursuance of the power so vested in the Council, 272 houses have been inspected and reported upon during the year. In the majority of these cases the necessary works were carried out by the owners upon receipt of notice of the Council's requirements, but in 137 instances it was necessary to take proceedings before a magistrate.

Dangerous Structures.

2,656 cases of dangerous structures from fire and other causes have been reported during the year. In consequence of the failure of owners to comply with the requisition of the Council's notices, 566 summonses were issued and attended by the solicitor during the year. Provision is made by the 80th section of the Metropolitan Building Act for the removal of the inmates from a structure certified by a competent surveyor to be dangerous to them; and in twelve cases it was necessary to enforce the provision and close the premises until the structure had been rendered safe. The Council's jurisdiction with respect to dangerous structures does not extend to the City of London. In the City the jurisdiction is vested in the Commissioners of Sewers, but it rests with the Council to allow the fees charged for inspection and survey. During the year seventy-eight accounts have been received from the Commissioners of Sewers for the inspection and survey of buildings in the City of London, reported to be in a dangerous state, on which, after examination, the usual fees have been allowed.

THE BRITISH MUSEUM.

THE annual report which has just been presented by the trustees shows that the number of visitors to the British Museum during the daytime has seriously decreased during the past year, the total being only 463,833. The grand total is, however, raised to 530,172, by the additional number of 66,339 persons who visited the Museum in the evenings between the hours of eight and ten P.M. The average daily number of visitors in the daytime was 1,491; that of visitors in the evening was 242. The number of persons making use of the reading-room has continued to increase, the total visits in 1890 being 197,823. The number of volumes supplied to readers was 1,226,126. Mr. E. M. Thompson, the principal librarian and secretary, gives a list of the chief donations to the Museum during the year. These include:—From Lord Savile, an archaic terra-cotta antefix, from Lanuvium; from the Earl of Derby, a choice series of stone and flint implements from Denmark, &c.; from the Earl of Lonsdale, a large ethnographical collection from North-West and Arctic America; from the Hon. Robert Meade, choice specimens of Chinese egg-shell and other porcelain; from Lady Charlotte Schreiber, watches and Mediæval antiquities; and from Mr. A. W. Franks, specimens

of porcelain of different countries, in augmentation of the Franks collection, and various antiquities.

The past year, says the report of Mr. R. Garnett, has been remarkable for acquisitions of celebrated bibles, including the Egenolff German Bible, Frankfort, 1534, of great rarity, and especially interesting from being adorned with the woodcuts from which the illustrations of the Coverdale Bible of 1535 were imitated; and the Acts and canonical epistles, and the Psalter, translated into White Russian, and printed at Wilna in 1525. With the exception of some portions of the Old Testament previously published by Skorina at Prague, and perhaps a version of St. Luke, these are the first translations of the Scriptures into Russian; they are also the first Russian books printed within the present limits of the Empire. To these are to be added an unique copy of an edition of Calvin's New Testament, printed at Geneva in 1551; a vellum copy, unique in this state, of Luther's translation of the Psalms, Leipsic, 1540; the New Testament in the Ober Egandine dialect of Romansch, 1560; the Malagasy Bible, Antananarivo, 1830-35, perfect copies of which are exceedingly scarce, the greater part of the impression having been destroyed in the persecution, and the few copies which escaped having been divided into small portions for more effectual concealment; Daniel Elzevir's family bible, with entries of births, marriages and deaths, on large paper, and splendidly bound by Magnus: Coverdale's version of the Psalms, printed by James Nycolson before 1538; his New Testament, probably printed about the same time; and "The Bokés of Solomon," including Wisdom and Ecclesiasticus, printed by William Copland in 1550. The Psalter is unique.

In English literature the fortunate acquisition of William Blake's first work, the "Poetical Sketches," 1783, has made good one of the most mortifying deficiencies in the library, pointed out as such by Blake's biographer Gilchrist nearly thirty years ago, but, from the excessive rarity of the book, never remedied till now. A similar acquisition has been made in a complete copy of the *Gownsman*, one of the two magazines conducted by Thackeray when an undergraduate at Cambridge; its companion, the *Snob*, has long been in the Museum. Rarer still are complete sets of the *Mite*, *Elf* and *Fairy*, miniature magazines chiefly written by Sir A. Panizzi and Lord Langdale, and printed at the latter's private press at Roehampton. Only two such sets are believed to exist; the one now obtained was Lord Langdale's own, and has a MS. key in his handwriting. Interesting acquisitions of like character are the original edition of Gibbon's "Mémoire Justificatif" for Great Britain against France in the American war, and the first edition of Emerson's "Nature," Boston, 1836. There is also one of the only two known copies of Bunyan's metrical "Discourse of the Building of the House of God," 1688. This copy was believed to have been destroyed at the burning of Mr. Offor's library, more than twenty years ago, and has only recently been discovered comparatively uninjured on an examination of the salvage. At the same time was purchased a Belfast edition of another of Bunyan's works, "Sighs from Hell," 1700, so far as known unique in this edition, which is also the first book actually ascertained to have been printed at Belfast.

Among numerous curiosities the most remarkable is a Chinese bank-note of the Ming dynasty, about 1368, a comparatively modern specimen for China, but three hundred years older than the first bank-note issued in Europe. No example of any other early issue is known to exist. With this may be mentioned Dutch treaties with Malay sovereigns, printed at Batavia in 1668, and Dutch and English newspapers printed at the Cape of Good Hope in 1804 and 1805—nearly the first examples of printing in these colonies; a benevolence or letter requiring a loan, addressed to a subject of James I., 1604—an application common enough in MS., but almost unknown in print.

Included with the donations is a beautiful edition of the musical compositions of Frederick the Great, presented by the German Emperor. The other chief additions to the collection of music have been a copy of the "Delphin de Musica," by Luis de Narbaez, printed at Valladolid in 1538—a book of the utmost rarity; a number of rare part-books of madrigals, canzonets, &c., published at Venice between 1596 and 1608; and a collection of 137 musical works, mostly printed in this country in the seventeenth and eighteenth centuries, which includes the scarce first edition of "Parthenia, or the Maydenhead of the first musick that ever was printed for the Virginalls," generally considered to be the first music printed from copperplates in England.

Out of the grants for the last two financial years an important series of antiquities has been purchased from the Earl of Carlisle, and divided between the Department of Greek and Roman Antiquities and the Department of British and Mediæval Antiquities and Ethnography. The collection of engraved gems, which forms the most important part of the purchase, was made by Henry Howard, fourth Earl of Carlisle (1694-1758). A letter of Horace Walpole to Richard West, written from Rome, May 7, 1740, describes the manner in which a part of the collection was acquired. The gems in the Carlisle collection are known to have belonged to Cardinal Ottoboni. According to the report of Mr. A. W. Franks and Mr. A. S. Murray, the collection is of importance, not only on account of its fine cameos and intaglios of undoubted authenticity, but also because it contains several specimens with reputed artists' signatures which have been the subject of controversy among archæologists.

THE VICTORIA COURTS, BIRMINGHAM.

THE Victoria Courts have been built by the Corporation of Birmingham, in accordance with an undertaking to provide assize courts when an assize was granted to Birmingham. The building was at first intended to contain the assize courts only, but the scheme grew, and it was decided to give up the present police-courts in Moor Street, and house them also in the new building. From the commencement Sir Thomas Martineau, a leading solicitor in Birmingham, actively interested himself in the scheme, with the result that a site in Corporation Street was granted by the Council, and with the assistance of Mr. Alfred Waterhouse, R.A., plans were obtained in competition, and those submitted by Messrs. Aston Webb & E. Ingress Bell were finally accepted. The foundation-stone was laid with due ceremony by Her Majesty the Queen in her Jubilee year, viz. March 1887, and the building has been in progress ever since. It comprises two large assize courts (civil and criminal), with reading-room for the Bar, robing-room, consultation-room, and all conveniences, retiring rooms for the judges and jury, solicitors, and witnesses' rooms. Also a third court, two police-courts, and a coroner's court, with the necessary retiring rooms.

A great feature in the building, both externally and internally, is the great hall, from which four of the courts open direct, and is a very fine apartment, 80 feet by 40 feet. In addition, there is a handsome room for the magistrates, a grand jury room on the first floor, and the necessary offices, also a refreshment block with the kitchens over. In the basement, extensive accommodation is provided for the reception and housing of the prisoners in separate cells.

The façade of the building in Corporation Street opened on Tuesday is very richly treated in a free Renaissance, and is constructed entirely of red terra-cotta, supplied by Mr. J. C. Edwards, of Ruabon. The sculpture in the centre gable bears the Royal Arms, and in the flanking gables emblematic figures by Mr. Aumonier representing the arts and crafts in the trades of Birmingham. The richest portion is the central entrance porch, adorned by a statue of Her Majesty in the gable by Mr. Harry Bates, and four spandrel figures representing the attributes of Justice, designed by Mr. Walter Crane and executed by Mr. Frith. Below the Queen is a group of St. George and the Dragon. The whole building is crowned by a figure of Justice, by Mr. Frith, who also designed and executed the charming little figures on the summits of the turrets. Red terra-cotta was selected as being the best material for withstanding the atmosphere of Birmingham.

Internally the great hall, the court walls above the panelling, and the corridors, are faced with buff terra-cotta by Messrs. Gibbs & Canning, of Tamworth, and the fittings and wall-linings throughout are of oak. The whole of the architectural modelling was admirably carried out by Mr. Aumonier from the architects' designs. The windows of the great hall are filled with painted glass, as a Jubilee memorial of the city of Birmingham, and were designed by Mr. H. Walter Lonsdale, and executed by Messrs. Heaton, Butler & Bayne. The internal wood-carving, which has met with general admiration, was done by Mr. H. Martyn, of Cheltenham. The gates and the metal fittings throughout the interior are Messrs. Hart, Son & Peard's work, and a point has been made to employ local firms, wherever practicable, throughout, who with the sub-contractors have carried out their respective work to the great satisfaction of the Corporation and architects. Especial attention has been given to the heating and ventilation. The foul air is extracted from all the courts by means of Green's air-compressed vessels, and are all under separate control; fresh air is admitted into large reservoirs under the court floors, which can be warmed or cooled as required. The courts are also heated by direct radiation from radiators in the courts, while the whole of these complex arrangements are brought under easy control of the engineer in an indicating room, where automatic thermometers also register the temperature of each court. The building is lighted throughout by electricity.

The general contractor of the works is Mr. John Bowen, of Balsall Heath, Birmingham, and the furniture has been executed by Messrs. Chamberlain, King & Jones, from designs by the architects. Happily, throughout the whole of the four years there has been no fatal accident to any of the men engaged thereon, though, unfortunately, two clerks of works, Mr. Clapp and Mr. Richards, have died. Their successor, Mr. E. W. Nightingale, has seen the building brought to a satisfactory completion.

NOTES AND COMMENTS.

Speculative building is too often treated in the courts as a sort of criminal action which should be punished in a more severe manner than is feasible under existing Acts. It is not plain why one class of business should be judged in that way, while in others speculation is allowed to go on unchecked. The Judge of the Brighton County Court took a more rational view of building enterprise in dealing with a bankruptcy case on Tuesday. The Official Receiver, in his report, had stated that the debtor, who is a builder, had been guilty of rash and hazardous speculation, and his honour said he had to consider how far speculative building was engaging in rash and hazardous speculation. The debtor possessed little or no capital, and he had done what all speculative builders did all over the country. He had taken plots of land on building agreements, and having no capital to build himself, he went to a solicitor or some one else to finance him. He did not see the difference between this and the ordinary manufacturer. The builder manufactured houses, and if there was a demand he made a profit as other manufacturers did. There were, of course, cases in which he might take a plot of land and contract debts without a reasonable probability of being able to pay them, and that would be a rash and hazardous speculation. In seaside towns they built houses when there was a demand, and realised as fast as they could, and in the end, perhaps, there were more houses built than could be got rid of. In this case the debtor commenced business in 1879, in partnership, with a capital of about 90*l.*, but the partnership only lasted for a fortnight. The debtor continued by himself, and in the latter part of his career he took a house when he was in difficulties, but there was nothing to indicate that he would not be able to realise the ordinary profit of a builder. He was not satisfied that this was a matter of rash and hazardous speculation, but he should be glad to have his decision reviewed. The debtor had committed the other technical offences under the Act, as he had not kept books, and had continued to trade after he knew himself to be insolvent, and for those offences his discharge was suspended for six months. But as to the graver charge of rash and hazardous speculation, he was, as is said in the North, "assoilzied." Of course it is hard on creditors that men should incur debts without means of paying, but the risks of speculative building should by this time be known to all the world.

When the Grand Canal, which connected Dublin with the Shannon and the West of Ireland, was constructed, it was natural that the extent of the traffic should be exaggerated. To provide accommodation for the crowds of passengers that were anticipated, a very big hotel, that would serve for Southampton, was erected at Portobello, in Dublin. But it was soon found that people did not need a resting-place of that sort, and the hotel was soon a failure. In course of time railways superseded the canals for all but goods traffic, and when the long narrow packet-boats ceased to be seen at Portobello, the hotel became a memorial of obsolete arrangements. An effort was made to uphold the building as a suburban retreat, but out of Venice and Amsterdam the view of a canal basin is not exhilarating, and for want of more profitable guests the hotel was employed as a refuge for the blind and as a charitable asylum. But as cheaper premises were easily obtainable, benevolent people could only employ the place for temporary purposes. In 1870 another attempt was made to utilise the building as a hotel, and a lease was granted at a rental of 125*l.*, which, if the area of the premises be considered, was only a nominal sum. The experiment was not successful, and in 1889 the Grand Canal Company were glad to accept a tenant at a rent of 100*l.* a year. The new lessee was wiser than his predecessors. On the opposite side of the canal stood Portobello Barracks, which needed enlargement. It was proposed to utilise the hotel, and the lessee arranged to accommodate seventy-six non-commissioned officers and their families. For that purpose it was necessary to make some alterations in the building. The Government, no doubt, agreed to pay liberally, and the Canal Company, after bearing so unprofitable a burthen for many years, were wroth to discover that they had failed to secure the War Department for a tenant. Application was made for an injunction to prevent the lessee from making alterations, on the ground that he had agreed to uphold the building as a hotel and was converting it into a military barrack. The Vice-Chancellor granted the injunction. The case was brought before the Irish Court of Appeal last week, when the previous decision was set aside as erroneous. The Lord Chancellor said all the parties seemed anxious to obtain as much as possible out of the War Office. As to the conditions of the lease his lordship said that the lessee was bound not to sublet to any person that was not solvent and respectable, and it could hardly be said that the War Office did not fulfil the conditions. The Lord Chancellor held that the alterations in the building were ameliorative, others might be trifling, but the original state of things could be restored for a few pounds. The case is instructive, but it is not unique. Owners of property which does not pay are very glad to secure a tenant, but they expect that the tenancy will entail sacrifices. If unexpectedly the building becomes profitable, there is an examination of documents with the view of annulling the tenancy. After so long an experience of a deserted hotel, the Grand Canal Company ought to rejoice in the prospect of receiving an annual rent for ninety-nine years, and it is not likely that any sort of occupation could diminish the value of the building.

A case is likely to be heard in the Scottish Courts which will determine an important question, that is, Can a Dean of Guild Court take the initiative in a case, and thus depart from the ordinary procedure in all courts? It is needless to say that a Dean of Guild Court to some extent resembles the committee of a local authority in England that is concerned with the approval of plans for new buildings, but the proceedings are more formal. In the Glasgow Court application was lately made for the erection of buildings in Finnieston Street. The original conditions dating from 1770 prescribed that all houses in the street should be at a distance of 20 feet from the street, so that the houses on both sides should be 90 feet apart. It was proposed in the case in question to build over the reserved space of 20 feet. No objection was made by the owners or occupants of houses in the street to the innovation. They may, however, have supposed that if liberty to build was allowed in one case it would be granted to other applicants. Although there was no opposition the Dean of Guild declined to approve of the plans of the proposed works. His grounds were that the master of works was bound to bring under the cognisance of the Court all deviations from the existing line of street, and that when that officer failed it was the peculiar province and duty of the Court to see that no deviation from or alteration of the existing building line of a street is permitted. As commonly understood, the peculiar province of a court is to hear evidence and to give decisions that will correspond with what is brought forward. It would not always bring about justice if the judges were to be guided by their own knowledge, although in many cases it may be an advantage for a judge to have intrinsic evidence of circumstances. As a departure from procedure the Dean of Guild's decision may be set aside. At the same time, it is well to have somebody who can take an interest in the amenity of a city or town and does not mind standing alone if injurious changes are prevented.

The annual fête in France has been as usual made the occasion to enroll some artists and others on the roll of the Legion of Honour. M. Baudouin, many of whose works were illustrated in this journal, was long entitled to distinction, for his decorative works in public buildings are admired by all competent judges. The chevaliers are also increased by the addition of other painters—MM. Demont, Doucet, Lagarde, Pelez and Saintin. M. Gerhardt has been selected as the representative of architecture, M. Peynot for sculpture, and M. Lecouteux for engraving. M. Charlemont, an Austrian painter, whose portraits and other works are much admired by fashionable patrons, has been nominated to the order at the instance of the Minister for Foreign Affairs. M. Larroumet, the director of the Department of Art, having grown weary with his official duties, wisely retired, and the promotion to the grade of officer will console him for any loss he may have sustained.

THE above premises stand on a prominent site on the south side of Eastcheap, at the corner of St. Mary-at-Hill; the roadway here is of considerable width, and under same in front of the building the District Railway passes, its Monument Station being close by. The structure has six floors, with the basement, and the extent of the frontage gives a good light interior. The angle of the site is rounded off into a bold curve, pilasters on ground-floor marking ends. Between these points a curved steel girder carries the work above, Mr. A. D. DAWNAY carrying out this and other constructional ironwork. Vaults extend under the pavements, and same and basement are well lighted with HAYWARD'S prismatic pavement lights, extending right round the building. The basement is 14 feet high, and the walls of same are lined with white glazed bricks. The pilasters to front on ground-floor are in red Aberdeen granite, the bases in grey granite, the cornice, &c., over in red Mansfield stone, carved over doorway. The whole of the joiners' work to shop fronts, doors, linings, soffits, &c., is in polished teak, with bevelled plate-glass to doors, &c. The work above ground storey is in specially moulded red brickwork supplied by the New Heather Colliery Company, this company also supplying the finials, scrolls, keystones, strings, cornices, copings, &c., moulded and modelled from the architect's designs. The work is a good example of a brick front carried out in moulded work throughout, including its ornamental features. At the corner the ground-floor and two floors over follow the curve of the site; on the next floor the angle is canted, and has a square bay projecting, finishing above with an octagonal turret. A square turret is placed at the east end of the building, which takes circular form in its upper stage. Both turrets have wrought-iron finials, and are covered with lead with ornamental ribs, bosses, &c. There is a fireproof floor over the shops, and the stairs are of fireproof construction to first floor. The other stairs are in teak, with mosaic to landings, entrance-hall, &c. The whole of the works have been carried out by the builders, Messrs. COLLS & SONS, of 5 Coleman Street, E.C., from the designs and under the superintendence of the architect, Mr. THOS. R. RICHARDS, of 25 Bedford Row, W.C.

THE NATIONAL GALLERY OF BRITISH ART.

IT is understood, says the *Times*, that the question whether the City shall find a site on the Thames Embankment for the proposed National Gallery of British Art is about to be determined, one way or the other. The committee of the Corporation, after going very deeply into the financial question, is believed to have decided not to recommend the free gift of the desired site; and now it remains to be seen whether any arrangement can be come to which shall mutually satisfy the Corporation of London and the Government. This, it is certain, can only be done by handsome concessions on the part of the City. The Government, with all the other claims upon it, cannot be expected to pay the full market price for the site, and public opinion would support it if it were to give the Corporation to understand that it could only treat on very exceptional terms. For the Government already possesses land of its own, some of which it has offered to the munificent donor of the gallery; and if it had not been for the unexpected opposition of the men of science, that land would by this time have been cleared for the building. In deference to that opposition from so highly-respected a body, the Government is content to look elsewhere for a site; but of course it would be too much to hope that, in the circumstances, they would go into the open market and buy an acre on the Thames Embankment unless the owners met them in a patriotic spirit.

There can be no question that the site in question, between the Temple and the City of London School, is the ideal site for such a gallery as it is proposed to found. The space is sufficient for a beginning, and there is more land behind; the position cries out for a fine building; it is open and airy; above all, it is central. A gallery built there would be free from the objections which the millions who inhabit East, South and North London commonly bring against South Kensington—that it is far from everything except the houses of the well-to-do. A British gallery at South Kensington would be little more that a superior edition of the galleries that exist there already. A British gallery on the Embankment would be, in course of time, a great national and civic institution. Everybody would see it; everybody would visit it. The advantage that it would be to the City is obvious. It would achieve for the Corporation the same result, on a very much larger scale, that has been already achieved by the very useful building close by, the Guildhall School of Music; that is to say, it would connect, in the minds of thousands, the name of the City of London with the arts and accomplishments that adorn life. We hope that patriotism and enlightened self-interest will induce the Corporation to propose such terms for the cession of the land as the Government can fairly accept, and thus to secure the success of a project in which the whole country is interested.

THE GOLDSMITHS' COMPANY'S TECHNICAL AND RECREATIVE INSTITUTE.

THE site of this institute comprises the buildings and land at New Cross, S.E., recently occupied as the well-known Royal Naval School, the foundation-stone of which was laid by the late Prince Consort on "the glorious first of June," 1843. On the removal of the school to country quarters the Goldsmiths' Company purchased the buildings and about 7 acres of land, and with considerable rearrangements and additions have adapted them to the present purpose. The old buildings formed the four sides of a quadrangle or open space of nearly 100 feet square, and with their numerous classrooms, large dormitories and general schoolroom lent themselves better than could have been expected to the change of circumstances, though no doubt many of the details would have been more conveniently arranged in an entirely new building.

The front of the main building is retired on rising ground from the Lewisham High Road, giving space for a garden with carriage approach to the main entrance and footways to the separate departments for men and women. In general terms, it may be said that the men's classrooms, the workshops, &c., occupy the right or northern wing, and the women's department the left or southern.

On the ground and mezzanine floors of the main front are the rooms of the resident secretary, Mr. J. S. Redmayne; the administrative offices and bookstall, at which students can purchase their class-books and other requisites at moderate prices. The first or principal floor is devoted to library and reading and news-room, 100 feet by 28 feet, approached by separate staircases from the men's and women's departments. Additional book-stores are arranged in the mezzanine below, communicating direct with the library.

The northern wing is occupied on the ground-floor by the refreshment-room, 90 feet by 24 feet, served by new and carefully-arranged kitchens, with their necessary adjuncts. Beyond this and in proximity to the gymnasium and workshops are the men's lavatories, with hot and cold water, locker-rooms, men's club-rooms, &c. In the mezzanine over these are the clay-modelling rooms and other smaller rooms, for the use of some of the masters, and for chess and other games. On the lofty first floor is men's social room, 50 feet by 35 feet, and approached by separate staircases, the art class-rooms having a total extent of about 200 feet by 35 feet, divided into elementary and advanced drawing, life-study, dressing-rooms for the models, lavatories, cloak-rooms, &c.

Approached from the ground-floor of this wing are the engineer's workshops, 70 feet by 30 feet, and large electrical laboratory, all fitted with the best appliances. Adjoining the engineer's shops is the engine, which drives the whole of the machinery, and the pumps, drawing water from a deep well sunk into the chalk, for the general supply of the establishment and for filling the swimming bath. Here are also the boilers which supply steam for the engine, for the general warming of the buildings and for heating the water of the swimming bath. In a block near to the engineer's shop, and having its machinery connected with the main driving shaft, is the carpenter's shop, with large class or lecture-room over, with several smaller rooms destined for type-writing, commercial classes and such of the less important branches of trade as it may be found necessary to accommodate.

The south wing, or women's side, contains on the ground floor classrooms for needlework, cookery and general instruction, women's lavatories, cloakrooms, &c.; also a large classroom, approached from both sides, and to be used chiefly for physical research or other special scientific demonstration. In the mezzanine are several private rooms and rooms for games, for small classes, or meetings. On the first floor is the women's social room, 40 feet by 35 feet; the chemical department, about 150 feet by 35 feet, approached by staircases from both sides,

and divided into elementary and advanced classrooms, each fitted as a complete laboratory with benches, sinks, fume closets and all experimental appliances. Adjoining is the balance-room, chemical lecture-room for 70 or 80 students, demonstrator's preparation room, &c. Above this are the photographic studio, dark rooms, &c.

In connection with the technical department must also be mentioned the old school chapel, capable of seating some 500 people. It is detached from the other buildings, and can be also approached from the public road should it be found desirable at any time to admit other than members. It has been deconsecrated by special Act of Parliament, an additional room has been added, and it is intended to be used as a general lecture hall, and for lantern exhibitions or for large musical classes, as occasion may arise.

In the recreative department, the feature which first attracts notice is the large concert hall, which occupies the site of the central quadrangle before mentioned. It is 98 feet by 88 feet, and is approached directly from the lobby in connection with the principal entrance. As it was necessary to preserve the light and air for the upper storey of the buildings round the quadrangle, and the existing walls were not of sufficient strength to carry a roof of so great a span, a special and somewhat novel method of construction has been adopted. Curved lattice ribs of great depth, bolted down to special foundations, spring direct from the floor level in the four corners of the hall. Uniting at the apex, about 40 feet in height, these form two diagonal arches of 125 feet span, leaving the whole surface of the floor free and uninterrupted by columns or other supports. Lattice girders or purlins, of 68 feet span, 25 feet from the floor, with others of less dimensions, carry the rafters and covering of the roof. The hall is well lighted from the roof at the junction of the main ribs, and by a series of skylights at a lower level. The platform and galleries for chorus are on the western side of the hall, and a fine organ is in course of construction by Messrs. Abbott & Smith, of Leeds, at a cost of some 2,000*l*. The floor of the hall will seat about 1,300 people according to County Council requirements, besides performers and chorus of about 100 persons. On the mezzanine level are galleries to hold 200 to 250, with independent staircases. Care has been taken to provide sufficient exit in case of panic among the audience. There is a spacious corridor on all sides of the hall, and besides the main entrance doors on the western side, which are 10 feet in width, there are two of 7 feet in each of the other sides, with corresponding doors in the outside walls of the building giving on to the open ground. The galleries are approached by similar corridors on the mezzanine floor, and special external escape stairs lead from each to the grounds outside the building.

Immediately at the back of the great hall is the gymnasium, about 100 feet by 38 feet, which has been adapted and enlarged from the old Royal Naval Schoolroom. On one side of this is a gallery, from which spectators can watch the special gymnastic displays which will take place from time to time. Here also will be fixed the motors for supplying air to the organ.

To the north-west of the principal buildings, and connected therewith by corridors, is the new swimming-bath, 90 feet by 50 feet, the pond itself being 80 feet by 30 feet, with a capacity of about 80,000 gallons. The bath is supplied from the well, the West Kent Water Company's mains being also connected for use in case of need. From the well the water passes through a heater, and is discharged into the bath as a cascade. By means of a centrifugal pump a continuous circulation is kept up, water being abstracted from the bath, passed through the heater, and returned by the cascade at the rate of some 6,000 or 7,000 gallons per hour with any fresh water required to make up for loss while the bath is in use. A uniform temperature of about 72 degrees is thus retained. On each side are a number of dressing-boxes, over which are galleries for spectators. There is a separate entrance to this bath from the public road, so that it may be available by arrangement for schools, outside clubs or such of the public as may be admitted on specified conditions. The old school swimming-bath (much too small for present requirements) still exists, and will probably be made available for private hot and cold baths should there be a demand for them.

Extending along the back of the building is a large paved court of about 2,000 square yards, which will be available for various games, drill and general exercise in the winter. Beyond this is the recreation-ground about 4½ acres in extent. At considerable cost this has been levelled, and a good running track laid out of about four laps to the mile. Inside the track is space for cricket, tennis or football.

With such experienced practical men as Sir Frederick A. Abel, K.C.B., F.R.S., chairman; Sir Frederick J. Bramwell, Bart., F.R.S.; Dr. W. Anderson, F.R.S., Director-General of Ordnance Factories; Mr. Charles Lucas, and others on the Building Committee, it may be safely assumed that the 70,000*l*. or thereabouts the Goldsmiths' Company are stated to have expended on the Institute and its appliances, has been laid out to the best advantage. It is clear, at any rate, that the chemical and electrical departments, the constructive ironwork and the engineering appliances generally, must have received special attention. The buildings were opened on Wednesday.

The whole of the works have been carried out from the designs and under the superintendence of Mr. J. Wornham Penfold, F.R.I.B.A., surveyor to the Goldsmiths' Company. Mr. Thomas Lee acted as clerk of the works under the direction of the architect. Messrs. Kirk & Randall, of Woolwich, are the general contractors. Messrs. James Simpson & Co., Limited, supplied the engine, boilers and swimming-bath arrangements; and the Thames Ironworks and Shipbuilding Company the constructive ironwork. The warming and lighting, cooking appliances and other fittings were executed by Mr. W. G. Cannon; the chemical working and lecture benches, lockers, &c., by Mr. Thomas Mitchell. The art department general class and lecture-rooms were principally fitted by the North of England School Furnishing Company and Messrs. Hammer; and the library by Messrs. Wake & Dean, the latter room being also fitted with the ingenious "indicator" of Mr. Cotgreave. The running track and general ground work have been carried out by Mr. George Neale, of Wandsworth.

ST. OLAVE'S, JEWRY.

OUR old City churches, says the *Daily News*, have made a brave stand against those who look with a covetous eye upon the precious sites that they occupy; but their shrunken congregations and empty seats have testified too clearly against them, and one by one the least needed are disappearing or being converted to secular uses. Vast banks and offices have taken the place of dwellings in their parishes; citizens of the class who, in John Gilpin's time, were content with an occasional outing with the wife and the children, now live in leafy places far away from the sound of City church bells and in the natural course of things, when the parish deserts the church the church has a tendency to desert the parish.

The latest of these edifices thus marked out for demolition is St. Olave's, Jewry, which together with the freehold ground it occupies, save only what is needed for the widening of Old Jewry, was offered for sale by Messrs. Fox & Bousfield, at the Auction Mart, on Wednesday. The affix "Jewry" is derived from the fact that it stands on part of the site of the Jews' House—a vast building of which Stow speaks as extending "of old time" over nearly the entire space between Old Jewry and Ironmonger Lane, northward from Church Court to what is now called Gresham Street. The poor old church, with its square stone tower and four pinnacles, looks forlorn enough just now, dismantled as it is within and neglected without. Its windows have been all shattered by wanton stone-throwers; its long grave ground, whose few sickly, and almost leafless, limes were yielding on Saturday no shelter from the burning sun, is barren of anything green save an unwholesome moss covering the whole like the slime in a stagnant pool. One of those gaunt starved cats who are left untended in town by cruelly thoughtless absentees at this seaside season is now the sole token of life to be discerned through the weather-eaten iron railings of this dismal spot. St. Olave's, Jewry, known in ancient times as St. Olave's Upwell, is one of Wren's churches, but it is not a remarkable specimen of his work. Near to it, in Ironmonger Lane, stood, before the Great Fire, another church known as St. Martin Pomary, or Pomeroy, from a famous apple orchard that once was here in the heart of London City, but after the fire the two parishes were united, and Wren's church thenceforth served for both. It is not a very remarkable specimen of that great master's work. One of the sights of its north aisle used to be a portrait of King Charles I. at his devotion, with his right hand on his breast and his left holding a crown of thorns and a scroll. Near this was a curious allegorical painting of Old Time with his hour-glass, standing beside a cupid reposing on fruit, and having beneath his feet a skeleton about 8 feet in length. Here, too, the eyes of curious visitors were gratified with a painting of Queen Elizabeth lying on a fine tomb under an arched canopy, with Her Majesty's arms upheld between two cupids; but our information is from old Hatton, of Queen Anne's days, and it may be that these once familiar glories of its north aisle have long since vanished. What monuments of interest the present church possessed, however, were there till the other day, when they were removed by Canon Ingram to the church of St. Margaret, Lothbury, which has profited not a little by these and other like spoils. Among them the most conspicuous is the handsome oak gallery, supported by Tuscan columns, the fine wainscot partition at the west end, and the altar-piece ornamented with Corinthian pilasters, supporting an open arched pediment, in which the arms of England are sculptured, and having between them figures of Moses and Aaron, with the Decalogue, the whole embellished with palm branches, fruit, leaves and "cartouches." The ancient monument to Thomas Morestead, "chirurgeon to Henry IV., V. and VI.," who built

the north aisle, and lay buried there, probably perished in the fire, together with that of Robert Large, the mercer, who was Caxton's old master; and that to Sir John Leigh, 1564, with its epitaph :—

> No wealth, no praise, no bright renown, no skill,
> No force, no fame, no prince's love, no toil,
> Through foreign land by travel, search ye well,
> No faithful service of the country soil,
> Can life prolong one minute of an hour,
> But death at length will execute his power.

Wren's structure could boast of none so dignified as these—of none, indeed, more noteworthy than the monument to Alderman Boydell, whose name now lives chiefly in association with an edition of Shakespeare which was at once the most absurd and the most costly ever published. The bust of the worthy Alderman now looks blandly down upon worshippers in St. Margaret's, for, thanks in part to the attendance of the Sunday-school scholars, who bring with them friends and relations, Canon Ingram is spared the humiliation of preaching on Sundays to an empty church. From this time forth St. Margaret's, St. Olave's (a living in the gift of the Crown), and St. Martin's in the Apple Orchard will be one parish with one church, and soon Wren's broken-down deserted old edifice will give way to lofty buildings in the modern City style; for this, as the particulars of Wednesday's sale remind us, is "within a few yards of the Bank of England"—a quarter where to tread the soil is to walk upon gold.

THE LATE SIR W. FETTES DOUGLAS, P.R.S.A.

WE regret to have to announce the death of the President of the Royal Scottish Academy on Monday last.

Sir William Fettes Douglas was born, the *Scotsman* says, at Edinburgh, on March 29, 1822. He was thus sixty-nine years of age. His father, James Douglas, was accountant in the Commercial Bank. His mother was Martha Brook, a grandniece of Sir William Fettes, Bart., the founder of Fettes College. It is not uninteresting to notice that Mr. James Douglas, his father, was in his day an excellent water-colour artist, and that not a few of his views of old Scottish castles were published in the beginning of the century in the *Scots Magazine*. In deference to the wishes of his father, young Douglas, who had been educated at the Southern Academy and the High School, entered the service of the Commercial Bank in 1836, and was in that establishment for ten years. His tastes, however, were all artistic, and his father was ultimately persuaded to allow his son to devote himself to art. Before quitting the bank he had worked diligently at home with his pencil and shown conclusively the bent of his leanings. It may be said that he had no systematic and academic training in art. He attended for three or four months the Trustees' Academy, then under the care of Sir William Allan, where he had for contemporaries the Faeds, Mr. Archer, Mr. Erskine Nicol and other artists who have risen to eminence, and there was a sketching club in these days, still spoken of with enthusiasm by its members, of which Douglas is described as having been the life and soul. He also worked a little in a desultory way in a life-class in connection with the institution, but for the most part the knowledge of painting which he gained was self-acquired. His life-studies and drawings were notable, even at this early period of his career, for that daintiness of draughtsmanship and delicacy of finish which characterised much of his work when in the fulness of his power. While prosecuting his art studies he attended the Edinburgh University, where he matriculated in 1847, and he took for two consecutive seasons the classes of botany under the late Professor Balfour, and anatomy under Professor Goodsir. Of the latter study he became so enamoured that it became a question whether or not he would abandon his artistic for a medical career. But art triumphed. Another fact of his early days may be mentioned. We believe he never copied a picture of any kind in his life; and so far he had the advantage of creating his own style, so to speak, and thus secured an originality of treatment which many painters are often unable to do, who only see through the medium of some favourite master whom they adopt as a model.

At the age of twenty-one Mr. Douglas began to exhibit by sending some portraits to the Scottish Academy. One of these, which was modestly catalogued *A Study of Light and Shade for a Portrait*, was a likeness of the artist himself, which those who remember it speak of as a striking and effective piece of work. In the two or three years immediately following he exhibited some rustic and other subjects, such as *Entertainment for Man and Horse*, *The Norseman and the Sicilian Captive*, *The Fiddler's Comfort*, *Bandits Selling Spoil* and *The Astrologer*. The last-named work attracted special notice as a conception imposing in character, and painted with a remarkably vigorous brush. *The Death of Sir Andrew Beaton*, *The Widow's Mite* and *The Intercepted Despatch* belong to this period. *The Knifegrinder*, exhibited in 1850, is an excellent example of *genre* painting; and *The Departure for Battle*, of the same year, represents with considerable artistic skill a group of armed soldiers, half-length figures, of the olden time taking leave of their friends.

In 1851 Mr. Douglas was elected an Associate of the Academy, to which in the following year he sent *The Biblomaniac*, a very clever work, and *An Auld Scotch Wife*, one of the most original and powerfully-painted pictures then hung in the gallery. With the former of these the artist seems to have entered upon the field of romance, out of which came so large a proportion of his subsequent productions. Of these, one of the earliest was *The Bibliopolists*, now in South Kensington. In 1854 Mr. Douglas received his diploma as full member of the Scottish Academy: he exhibited that year three pictures. The first was an illustration of the well-known story of "Dean Swift and the Errand Boy." The lad who has brought the present of game is duly installed in his reverence's chair, a piece of furniture which, as might be expected from the dean's habits and customs, is somewhat out of repair—disorganised, in fact, as the bookshelves against which it is relieved, or even as the books themselves. The Dean's portrait is undoubtedly a lifelike representation of this eccentric character, according to the descriptions given by his contemporaries. The accessories of the picture are painted with exquisite finish, and the nose and expression of the young man in the chair are wonderfully significant of sly humour. The second work of this year was the *Attempted Assassination of the Prince of Orange*, a subject which, though foreign to the artist's usual themes, is treated in a masterly and most effective manner, both with regard to colour and design. The third picture was *Philosophy in the Olden Time*, suggested by Scott's lines :—

> For when in studious mood he paced
> St. Andrews cloistered hall,
> His form no darkening shadow traced
> Upon the sunny wall.

In 1855 his contributions to the Academy included *The Guard-House Chorus*, a capital work, remarkably vigorous in manner, fine in colour, and the figures extremely well drawn; *Monkish Transcribers* and *Among the Brambles*, a very elaborate and prosaic transcript of nature. Under the title of *The Tempter*, appeared in the following year a picture that might not inappropriately be called *The First Thought of Murder*. The composition contains two figures, one of which is seated at a table and is tempted by the offer of a reward to commit some foul deed by a shadowy figure behind, who places a pen before him while he charms his ears with the sound of gold. It is a striking subject, elaborately worked out. With it was the *Rosicrucians*, a group of those mystics of past ages engaged in conversation as they stand before a curtain drawn across the apartment.

In 1857 Mr. Douglas visited Italy, less, however, for the purpose of study than for pleasure and a desire to see the country—in fact, as he himself remarked, he "did nothing but prowl about the old churches and curiosity-shops." Yet he left in Edinburgh for the Academy exhibition of the year this picture, *The Messenger of Evil Tidings*, a scene of the time of the Civil Wars, to judge from the costume of the figures. It tells its story dramatically and perspicuously, and is placed on the canvas with much artistic power. This picture was accompanied by another—*The Alchemist*—showing an interior, in which is seated the man of science intent on some profound study and surrounded by a mass of objects, such as a painter who delights in things "old and strange" rejoices in as models. The old monkish legend of "St. Dunstan and the Devil" supplied Mr. Douglas with a subject for a capital picture exhibited in 1858. During the next four or five years he painted *The False Astrologer*, *The World Within and the World Without*, *The Arrest of Pietro d'Apone*, *Vesalius*, *The Saintmaker*, *The Last Hours of a Dark Life* and *The Errand of Mercy*. From the hand of almost every other painter than Mr. Douglas the subject of a picture painted by him in Edinburgh in 1862, *Dante arranging His Friends in Inferno*, would have taken most of the visitors by surprise. But the Scottish public frequenting the annual exhibitions of the Academy had become well acquainted with the romanticism of the artist, and regarded his work only as accumulative evidence of his power to treat even the strange, unearthly imaginings of the great Italian poet in a suitable and appreciative spirit.

It was in this year that Mr. Douglas first appeared on the walls of the Royal Academy of London, to which he contributed three excellent, though comparatively small, paintings, respectively entitled *Criticism*, *The Page*, and *A Monk of the Order of San Carlini*. The following year he sent to the same gallery a portrait of Dr. Laing, Honorary Professor of Ancient History in the Scottish Academy. The distinguished antiquarian is seated in his library; the contents of which, such as a man of his tastes and acquirements would gather into his sanctum, afforded the artist ample materials for the exercise of his delicate pencil. The same picture was exhibited in Edinburgh in 1864. With it was *The Alchemist on the Verge of a*

Discovery, a composition which, like some others from the same hand, is capable of diversified reading; and this had a touch of humour in it. Disturbed in his study by a noise in the adjoining room, the dreamy student has come to search for the cause; the dark outer chamber is draped with tapestry on which a love scene is embroidered; but below the picture are visible two pairs of feet—one masculine, the other delicately feminine—and an open window and the rope ladder tell the tale, not very moral, it is true, but artists are privileged. The beautiful glimpse of the moonlit city through the open window, the lighted study of the alchemist, and the dark tapestried outer chamber, form an artistic combination which has called forth the nicest skill of the painter. To this must be added two others of the same year. *Curiosity* represents a lady in her husband's study amusing herself with a beautiful child, and while so doing chances to light upon a small portrait-case, which is supposed to contain a likeness of some fair *inamorata*. *The Spell* is one of those mystical subjects so often indulged in by the painter. There is much originality in the composition, which sufficiently declares itself; probably it is intended, like the astrologer, to have a double meaning. Looking at the picture inverted, there may be seen on what forms the table-cover a pair of lovers in a beautiful landscape. Possibly this forms a key to the "spell."

Mr. Douglas's most attractive picture in the Edinburgh Exhibition of 1865 was the *Return of the Carrier*. An elderly man is seated in his study deeply intent on his papers; a beautiful girl, his daughter, sits on the floor near him. Through an open window the spectator catches a glimpse of the city and the clear blue sky; a carrier pigeon, bearing a letter, has found entrance, and alights behind the chair of the father; the girl's anxious gaze on the bird betrays her secret. *Perfect Solitude*, exhibited with it, is a satirical title of an admirable picture; it also represents a study or library, richly furnished, and abounding with *objets de luxe* and costly-bound volumes, among which is a young girl evidently lost amid her surroundings. *The Conspirators* was a contribution to the Scottish Academy exhibition of 1866; *The Whisper*, which was exhibited in the same year, represents a page and soubrette or waiting woman probably occupied in discussing some love revelation. As an example of *genre* painting, it could scarcely be surpassed. *Waiting for a Last Interview* was hung in the Royal Academy exhibition of 1866; and the *Old World and the New* appeared in the same gallery in 1869.

In 1869 Mr. Douglas was elected secretary of the Academy in succession to Mr. D. O. Hill, but he relinquished that office after holding it for only a short period. On the death of Mr. James Drummond, R.S.A., in 1877, Mr. Douglas was elected as curator of the Scottish National Gallery, a position for which he was eminently fitted, and during his time a revised edition of the catalogue, with interesting notes from his hand, was published. In 1882, on the death of Sir Daniel Macnee, he became, at the call of the Royal Scottish Academy, the president, though in doing so he made a considerable pecuniary sacrifice, and in May of the same year he had the honour of receiving knighthood from the Queen at Windsor. In 1884, on the occasion of the centenary of the university, he received the honorary degree of LL.D.

After a period of inactivity Sir William Fettes Douglas greatly surprised and delighted his friends by taking to water-colour drawings of landscapes, and these he executed in a very beautiful way. As a rule he touched them with a broad and effective pencil. The subject had always an interest of its own, but the charm of the drawings consisted in their soft, restrained colour and delicate treatment of aerial effect. Many of his friends who were fortunate to secure such drawings cherish them among their pictorial treasures. From all that has been said, it will be readily perceived that Sir William Douglas has long held a leading position among Scottish artists. His pencil rarely touched a subject that he did not adorn.

His favourite subjects have been very well indicated in the recital given above of his principal works. He occasionally treated Scottish rustic life, but he found more congenial themes in history, in depicting the lives of antiquarians and bibliomaniacs, and in that remarkable series of pictures which deal with the "uncanny" mysteries of the astrologer and alchemist, which began in 1844 with *The Astrologer*, and were rounded off in 1873 with *The Magic Mirror* and *A Dabbler in Alchemy*. In these the touch of *diablerie* is so dexterously given that the spectator feels insensibly moved in the same way as the messenger, for example, in that splendid work, *The Summons to the Secret Tribunal*, who comes into the dark chamber with his cross-hilted sword held before him. In all these pictures no one can fail to admire the thoroughness with which they are painted. The draughtsmanship of the figure is masterly, the characterisation varied and appropriate, the colour is often rich and glowing like that of an old Italian master, and added to that we find displayed in the works the great skill the artist had in his handling of light and shade. In the pictures, too, with antiquarian subjects, how delightful are his studies of still life; with what subtilty and delicacy he painted parchments, old books and furniture, and how beautifully harmonised in colour these were by the unity of purpose which always distinguished his works. In minuteness of finish and keen observation no pre-Raphaelite could have rivalled him, and he has not inaptly been termed the greatest painter of still life that Scotland has produced. Occasionally Sir William painted a landscape in oil, and if one were asked to name his masterpiece in that department of art it would be the upright picture of Stonehaven, dated in 1875.

Sir William Fettes Douglas was a man of various accomplishments, especially in all subjects that had a relation to antiquarian lore. He resided a good deal in Italy, and, as already indicated, the old curiosity shops of that country had for him a great fascination. He picked up many good and rare things in his day. He formed, for example, a fine collection of coins and Renaissance medals, which were disposed of to good advantage at Christie's in 1883. As a recreation, he went in for collecting works illustrative of what might be called the by-ways of Scottish history and topography, and his fondness for hand-illuminated books, such as missals, and of books with fine old bindings, was also well known. He was an excellent linguist—spoke French, German, Spanish and Italian with fluency; and he had a marvellous memory. A great reader, he remembered much of what he had read. What he saw in his frequent travels was also tenaciously retained, so that at the proper time he never failed to display great command over his intellectual resources. Though possessing a knowledge of art second to none in Scotland, he rarely wrote on his favourite subject. After he became President of the Royal Scottish Academy, he felt it an irksome thing to put ink to paper to put down even the heads of his addresses to the students or of his speeches at the annual banquets. His addresses to the students generally were original, rich and racy, and of a stimulating character. Sir William Fettes Douglas was a man of hospitable disposition, and for some years, when he lived in the quaint old mansion-house of Bowbutts, Kinghorn, where his rich and varied collection of curiosities were displayed, he entertained his friends with characteristic generosity. Latterly, since he fell into bad health, he has lived a quiet, almost retired life. He was a Member of the Board of Manufactures and a Fellow and office-bearer of the Antiquarian Society, and at both of these Boards his counsel was sought and valued. His wife, who survives him, is a daughter of the late Mr. Barron Grahame, of Morphie, Forfarshire, who in his day was a great virtuosi and collector.

A JERUSALEM CHURCH.

THE last number of the "Quarterly Statement" of the Palestine Exploration Fund contains a description by Professor Hayter Lewis of some ruins of a church on the Skull Hill, Jerusalem. During the last few years, he says, building operations to a large extent have been carried on in the environs of Jerusalem, and several objects of interest discovered during the attendant excavations have been duly noted from time to time in our "Quarterly Statements." Amongst these discoveries was that of the small Crusaders' Church near the road, north of the Damascus Gate. The remains of the Crusaders' Church still exist as so described, but the stone on which were the very interesting paintings (representing Our Lord and His Disciples) has been exposed to the air, and only faint traces of them can now be seen.

The land to the eastward of this church was purchased some years since by the French Dominican Friars, whose excavations for the erection of their buildings soon exposed one of the most interesting series of tombs near the city. They have been preserved by the Friars with great care and at considerable expense. Continuing their excavations westward, a trench 8 to 10 feet deep uncovered portions of a tesselated pavement in good condition, and composed entirely of different coloured marbles. I was enabled to see this in 1886, owing to the kindness of Dr. Selah Merrill, the well-known author and American Consul at Jerusalem, who had specially noted it, and so much of it was then exposed as to show that it was the pavement of one long corridor or other apartment, at least 50 feet long. But there was nothing in the design of the mosaic or any of its surroundings to disclose the nature of the building.

Since then, however, the excavations have so far proceeded as to uncover the greater portion of it, and when I saw it again last year it was clearly shown to be the remains of a church, presenting several peculiarities of much interest. It is on the well-known Skull Hill and north-west of Jeremiah's Grotto, and about north of the tomb suggested by General Gordon as probably that of Our Lord, and so indicated in the sketch, &c., given in the "Quarterly Statement" of April 1885. It was evidently three-aisled, with an apsidal eastern end to the centre and square ends to the other aisles, the total length, exclusive of apse, being internally about 105 feet and the breadth 65 feet, being thus about the same width as St. James's, Westminster, but 20 feet longer. The fine church of St. Anne at Jerusalem is only 90 feet long.

The site of this edifice has been interfered with in a very singular way by two deep cuttings in the solid rock. The southern one is cut perpendicularly down to a depth of 16 feet, its shape being irregular, averaging about 36 feet by 27 feet. The northern one has only a trench dug round it, and Mr. Schick is no doubt correct in saying that these excavations were intended "to make a tank or pool, and to quarry stone for building at the same time." It is tolerably certain, however, that the pool was never used as a tank, as a careful examination shows no trace of any cement lining. It is unnecessary to enter further into the purpose or date of these rock-cut excavations, because they do not seem to affect in any way the description of the church, except that they were supposed by the Friars to point out the site of St. Stephen's Tomb —but not the slightest trace of this has been found.

At the western end of the church the wall has nearly disappeared, but there are sufficient traces remaining to show its position, which seems to have been fixed by that of some ancient tombs. One of them has been closed by a rolling stone. The positions of the two aisle columns to the west are well marked, and the Friars assured me that another one had been found, although again covered up. I could not, however, fix its exact position. The sites of any other columns on the north side were still unexcavated when I last visited the place, and, of course, the pool (now entirely cleared out) has obliterated all traces of any work on its site.

Very fortunately one moulded base has been found, evidently belonging to the column mentioned below, its section being like those in the basilica at Bethlehem, the upper torus of which has a peculiar flat and ungraceful form. A long length of one column has also been preserved; its diameter of 3 feet, supposing it to be Corinthian (as in all probability it was), would give a height, including base and capital, of about 30 feet. The three door sills show the probable place of the old doorways.

But the most interesting part of the church, and, fortunately, the best preserved, is the eastern. The stonework of its walls has been, indeed, to a large extent removed, but their external outline has been curiously preserved by a coating of plaster with which they were originally covered, and which now adheres tenaciously to the *débris* which lies against them, showing with complete distinctness the mark of every stone and joint.

I have not met with such another instance of this in any excavations, but Mr. Petrie tells me that he has found such a one in Egypt. There is not anything to indicate the precise form of the interior, but there can scarcely be a doubt that the centre was the usual circular apse.

The steps from the general level of the mosaic to the chancel floor are *in situ*, and so is, to all appearance, the curious slab in the centre of the apse. There are no other indications of the original floor of the chancel, but at the east of the slab was found a large stone, roughly cut to a circular form, 5·2 in diameter and 2·7 high. Both its upper and lower surfaces were quite flat and even.

The shape of the slab with its curious lip and the channels made evidently for the purpose of receiving and pouring off liquids will strike anyone conversant with Egyptian antiquities as having strong resemblance to the tables of offerings, numbers of which are in the museum at Gizeh, and many also in the museums of Turin and Paris. In our own (British) Museum there are several such tables, many of which have a short leg at each angle. But this is not seen generally, and the slab at Jerusalem does not have it.

I know personally of no example of such a slab in a Christian church, and I cannot learn from those of my friends who are best acquainted with Christian antiquities that such another is known in Europe.

Mr. Butler, in his well-known book on the Coptic churches in Egypt, describes several altar-slabs, with channels for washing, and also particularly one at St. Pudentiana in Rome of the fourth century. And the "Encyclopédie Méthodique: Antiquités," vol. i. p. 377, also notices that "Quelques autels antiques sont creusés en dessus et percés de côté pour recueillir et laisser écouler ensuite les libations." But the peculiar lip is absent, and there are no crosses in the Jerusalem slab such as one would expect to find in an altar-stone in any but a Coptic church. Mr. Butler also mentions that beneath the Greek altar there was always a place to carry off the rinsings from the priests' hands and the water used for washing the sacred vessels, and in reference to this I find many notices in ecclesiastical writers, *e.g.*:—

In Durandus, lib. i. "De Altaris Consecratione:" "Ecclesia quoque interim aspergitur et aquæ residuum ad basim altaris funditur." Again, in Martigny's "Dictionary of Christian Antiquities," he describes under the head of Autel (page 60):—"A la base de l'autel se trouvait une piscine où le prêtre se lavait les mains, &c.; on y jettait aussi l'eau qui avait servi à laver les vases sacrés." The absence of crosses appears to me to show that the slab was not an altar, but that it was used as our piscina, to receive the washings. But the lip is a form which, so far as I know, is unique in a Christian church.

The circular stone is equally curious. Bingham, in his "Antiquities" (vol. ii. section 8), speaking of the French Council in A.D. 509, notices that "whereas before that time (in France) they were in the form of tables, they now began to be erected more like altars, either upon a single foot or pillar in the midst, &c., or upon an edifice erected like a tomb." Such a tomb-like edifice exists in the subterranean church of St. John the Baptist at Jerusalem (v. "Notes to Ordnance Survey," p. 59), but I have no recollection of an altar-stone "on a foot or pillar." Professor Middleton, however, states that there is one so constructed at the very early church of St. Angelo at Perugia. This example (which has escaped my notice) may certainly be taken as a confirmation of Bingham's statement. Probably, therefore, the circular stone may be considered as used for a similar purpose.

Finally, we have to consider the tesselated mosaic which formed the pavement of the church. This is made of different coloured marbles, viz. white, black, red, yellow and blue, there being no terra-cotta or stone used anywhere. The tesseræ are ⅛ inch to ¼ inch square, according to their position. The border is one of the ordinary Roman patterns, and the rest of the work is only peculiar as being very plain in design for so costly a material, no figures or foliage being introduced. The workmanship throughout to the border is good, but the tesseræ to the main portion are laid very irregularly. It is everywhere, so far as I could see, fitted to the walls, and was, to all appearance, laid after they were built.

For some clue as to the date of the floor we may turn to another example in Jerusalem, viz. in the church of St. Cross, which is said to have been built by Justinian, and only partly destroyed by Chosroës. I have not seen this pavement, and only know it from a description kindly given to me by Mrs. Finn and from Pierotti's drawings; but if these be correct it is very debased work and the design very poor.

Many other mosaics are now being uncovered in the vicinity of Jerusalem, more particularly near the present Zion Gate, and these are of good workmanship, but plain, and much like that at the church which I am describing.

If we turn to other parts of Palestine we shall find, perhaps, the best example in that given by E. Renan in his "Mission de Phenicé," of a Byzantine church about two leagues from Tyre, and said to have been built in the sixth or seventh century; and there is an inscription which distinctly assigns the mosaic to that date. But in a long and careful treatise on the subject given by Renan, it is clearly shown that this inscription is an interpolation, the mosaic itself being of a much earlier date.

We have, then, the following facts, viz.:—That the church of which we have the ruins on Skull Hill was very ancient, as is shown by its single apse. That the octagonal form of this apse, externally, proves that it was designed under Byzantine influence before the distinctive features given to it in the plan of Sta Sophia at Constantinople and nearly all later Byzantine works. That the church was arranged according to the Roman rite, and with very antique arrangements of altar, &c. That the pavement was Roman, and laid down at a time at which great activity prevailed in ecclesiastical work at Jerusalem generally, as is shown by other large remains of similar mosaic pavements in other parts near the city. That the marble linings still remaining to the north-eastern base, together with the costly mosaic floor, show that this church was one of great magnificence. There is no mention of its erection in the account of Justinian's work given by Procopius.

It appears to me that its authorship is explained satisfactorily in the annexed note, given to me for other purposes by Sir C. W. Wilson:—"I do not think that sufficient attention has been given to the great building period at Jerusalem when the Empress Eudocia was there. She built St. Stephen's Church, and it was, too, about this period, or a little later, that I attribute the many churches including that, *in probatica*, the Siloam Church of Antoninus, &c." The history of the Empress is well known. She married the Emperor Theodosius II. in A.D. 421, made a pilgrimage to the Holy Land in 438, and a short time afterwards began the erection of St. Stephen's Church, in which she was buried, her death taking place in 460. It appears to me that the remains of this church fulfil the conditions which we might expect at such a time, when Roman work had been influenced by Byzantine.

The position of the church appears to agree fully with the requirements of this opinion. It is situate on the commanding hill which is well known as the Place of Stoning, close to the Gate (Damascus) which was formerly known as St. Stephen's, and answers to the description given by the Russian Abbot Daniel (1106-67 A.D.), who appears to have entered by the Nablûs road:—"To the left, near to the road, there is the church of the first martyr, St. Stephen—it was at this place that he was stoned by the Jews."

There is, however, the fact to be ceded that the pilgrim Theodorich (c. 1172 A.D.) says, in describing his tour from west to east, outside the walls of Jerusalem, "before you reach the northern gate you find, upon a hill, the church of St. Stephen, the protomartyr," &c. The pilgrim Antoninus (c. 570 A.D.) makes a similar statement, so that we have his description of

the site of the ancient church before the destruction of the churches by Chosroës, and Theodorich's description to the same effect after its rebuilding by the Crusaders.

These accounts would, apparently, place the church on the hill to the west of the Damascus road, and away from the Skull Hill, the position being that suggested by Dr. Chaplin in the "Quarterly Statement" for 1876, p. 9, and very close to the tomb which Major Conder has suggested as being very probably that of Our Lord. Some of the other pilgrims appear to support this view, but others place the site of the stoning and of the church in entirely different positions from the above, and the various statements are otherwise singularly confused and at variance with each other. They are given clearly, and collated, in the Appendix A to the description by the Abbot Daniel (P. Pilgrims' Test. Soc.), and I will not attempt to reconcile them.

All that can, I think, be said at present is that we have no remains except those of the church which I have above described, which appear to fulfil the conditions of the Empress Eudocia's church. The sarcophagus which was found on the Western Hill (v. "Quarterly Statement," 1876, page 9), though of great size, was, I believe, quite destitute of ornament, and not likely to be that of an Empress. The position of her sarcophagus may possibly be indicated by the chamber to the south of the church.

REHOUSING THE POOR IN MANCHESTER.

A SPECIAL COMMISSION of the *Lancet* has reported on the schemes for the rehousing the poor in Manchester, and it will be seen that some of the statements are applicable to other towns:—

So far back as the autumn of 1889, it was decided to lodge a petition with the Local Government Board, asking for a local inquiry. In November of the same year a Bill was prepared for Parliament, entitled the Manchester Dwellings Scheme, 1890, by which the Corporation were to have the right of expropriating the owners of the condemned property, and of erecting in its stead suitable dwellings or lodging-houses for persons of the working class. Four different areas were included in this scheme. The first that has been mentioned, measured 19,271 square yards, and had 1,250 inhabitants; the second, 4,233 yards, with 400 inhabitants; the third, 863 square yards, with 120 inhabitants; and the fourth, 956 square yards, with 100 inhabitants. The cost of the land and improvements was set down at 103,000*l*. The interest of this scheme rests not so much with the size of the areas involved, but on the far-reaching plan of action on which it is based. The Corporation intended on the first and largest area to build a model common lodging-house, similar to those already built by the city of Glasgow. This common lodging-house, like those of Glasgow, was to remain the property of the town. On the remaining land model tenement dwellings or artisans' cottages were to be built, and let out directly by the municipality to the occupier. This being accomplished, the municipal property was destined to serve as a model and a menace to all property owners. Having set the example, the authorities of the town were to treat all owners of insanitary and degraded property with unprecedented severity. They were to be told that if they did not make their houses as good in every respect as the houses, &c., owned by the municipality, they would, in their turn, be expropriated, and the town would undertake to build proper dwellings. In a word, the Corporation was about to compete with private owners, and compel the latter to vastly improve their property or to sell out.

This seemed a bold scheme, and at first sight gave every promise of success. Unfortunately, we have to deal with a number of details that combine together to thwart the scheme. A very important change has taken place in Manchester during the last thirty years, and it very disadvantageously affects the powers for doing good the municipality would otherwise possess. Formerly most of the owners of the property tenanted by the poor of Manchester were fairly respectable people. They had of necessity, however, to employ a very harsh class of men as rent collectors, or property agents. These agents were often rough, hard, uneducated men, the very last class of person likely to appreciate the broad interests of humanity involved in the cause of sanitary reform. Yet these property agents have now become to a very large extent property owners. The former owners, sometimes gentlemen of broad and generous views, were also often spendthrifts. They therefore too readily consented to accept loans of money from their rent collectors, and the latter thus gradually became owners of the property for which they had been but the agents. Soon a numerous class of people commenced seeking by every means to become the owners of poor cottages and of bad property. By the operations of building societies also a good many houses have passed into the hands of this class of person.

The mischief this has wrought will be easily understood. As a class these owners are opposed to sanitary reform. It is the bad, over-crowded, degraded and insanitary property that, in proportion to the capital invested, brings in by far the largest profit. The tenants for the most part pay their rent once a week, and are very often a few weeks in arrears. They stand, therefore, in terror of the collectors, who at any moment may throw them out into the street. As most of these tenants occupy, not lodgings, but cottages, they have votes for the election of the Town Council, but they generally vote for the nominee of their landlords. Thus this new class of property owners, which has sprung into existence within the last few years, influences both the poor and the members of the Town Council. Yet, and in spite of this undoubtedly strong and hostile influence, the very bold scheme of sanitary reform we have described above was adopted by the town and received the sanction of Parliament.

If we look a little below the surface, it will be seen that those who receive their income from the poor may still hope to enjoy for some time to come a very large measure of immunity. It will soon be discovered that, after all, the Housing of the Working Classes Act of 1890 works to the advantage of the landlord. With the exception of the 10 per cent. extra compensation for compulsory sale, it is in the main a repetition of the Land Clauses Act. The sum of compensation which the sanitary authority must give to owners of condemned property has to be fixed by an arbitrator, and this arbitrator can, if he chooses, take into consideration not what the property is worth, but what it may be worth by-and-by. He may make allowance for the unearned increment that may accrue at some future date. Nor is this all; the owners of the property, however vile and worthless it may be, have the right to retain counsel at the expense of the sanitary authority. Consequently they often employ the most expensive legal advice available to defend their interests. In this way the legal costs are sometimes greater than the value of the property; and in practice the cost of expropriation is likely to prove prohibitive. The length of time which the arbitrator takes to investigate the claim, the costs incurred by the owners of the condemned property, result in so heavy an outlay that the whole scheme is handicapped at the very commencement, and the hope of financial success rendered doubtful. Obviously, condemned property should not be treated in so lenient a manner. If a property is in a good condition and does no one any injury, and yet the owner has to be expropriated so as to make room for some public works, thoroughfare or other improvement, the desire to treat such an owner fairly and generously can be understood and approved. But where the owner so far fails in his duty to maintain the property in a sanitary condition that it becomes unfit for human habitation, and the sanitary authority have to go to the trouble of taking this property over so as to pull the bad houses down and build good houses in their stead, the claim to full compensation does not hold good.

At Manchester, however, everything indicates that the law costs will be so heavy and the compensation given to the owners of the property so liberal that the sanitary reformers will be discouraged and the scheme will not be followed up. The actual scheme will of course be carried out, but the rehousing of some 2,000 persons out of a population of more than half a million, will not very materially contribute to reduce the Manchester death-rate. It was, above all, the effect that this scheme would have on the owners of bad property which promised to produce such good fruits. If, on the one hand, the owners of the condemned dwellings had been expropriated at a comparatively small cost and at some loss to themselves; and if, on the other hand, the property thus municipalised proved a source of income to the town, then the threat of treating other property in the same manner would indeed serve as a sword of Damocles, and terrorise speculators in bad property and make them put their houses in order. As it is, such persons will not care for the threats of the sanitary authority. They will know that these threats are not likely to be carried out on account of the great expense, and that in any case they will get good compensation. Thus the poor of Manchester will continue to be badly housed in spite of the large sum the municipality is now expending.

Yet the difficulty of dealing with such an area as that we inspected ought not to be great. There can be no possible hesitation as to the necessity of pulling it all down. The entrance, for instance, by a particular court, presents a most deplorable picture. The houses on either side of this court, though facing the main road, are so old and dilapidated that there is not a straight line remaining. The floors, the steps, the gable of the roofs, the frames of the windows all slant in different directions, and have ceased to be horizontal with the street or the foundations. The passage or court is a yard wide, and across are beams and planks, so placed as to prevent the houses on either side from falling in upon each other. Alone they could not stand, and yet they are inhabited. Beyond the court passage there are some very small two-roomed houses, these rooms measuring 845 and 847 cubic feet of space each. Who can say how many persons have slept at one time in these

very small houses? The statistics of the number of inhabitants were taken long after it was known the district was about to be condemned. Every preparation had been made for the inspection, and it was carried out during the day, so that there was no reliable knowledge gained as to the overcrowding. Yet, even under these circumstances, seven inhabitants were found in two rooms measuring in all 2,645 cubic feet. The space in the bedroom was only 1,210 cubic feet, so that if they all slept together there would be but 174 cubic feet each. Another house of two rooms, measuring 1,104 and 1,305 cubic feet, was occupied by two families numbering six persons in all. The inside space in one house was only 1,690 cubic feet, and there were four inhabitants; next door the house measured 1,694 cubic feet of space, and had five inhabitants. It may be argued that this makes a little more than 300 feet for each person, which is sufficient under certain circumstances, such as in a dormitory with efficient ventilation and little or no furniture. But these houses contain lumber and furniture and sometimes a hawker's stock-in-trade. The breathing-space is thus very considerably reduced. Some of the inhabitants are Italians—organ-grinders and penny-ice dealers. What the condition of ices made in such courts must be had best be left to the imagination. Other inhabitants are very poor labourers, and of course the habits of this class of tenants do not tend to improve the property. The scenes of misery, of squalor and of dirt to be witnessed within these small, ricketty houses are truly appalling. The dirt and despair of the one discourages the other, and these tenants will never be raised from their present abject condition till they are removed to better surroundings.

In hopeful contrast with this scene of misery is the exhibition in one of the rooms of the municipal buildings of the plans and drawings for the rebuilding of this rookery. A competition has been organised for the best scheme for the artisans and labourers' dwellings that are to be built by the town on the condemned area. These plans are replete with all manner of conveniences, even of luxuries and artistic attractions. Thus one designer carefully provides sills on all the windows for the cultivation of flowers. On each floor there are shoots for coal and for rubbish. On the roofs there are terraces. There are separate, well-ventilated, well-flushed water-closets for males and females. There are hot and cold water baths, recreation grounds and gymnasium. Special inlets and outlets for the ventilation of rooms are provided, independently of the opening and shutting of windows or of doors. In fact the projects exhibited suggest what will be considered a working man's palace when compared with the existing slum. Such a transformation should be hailed with joy and hope by those who have at heart this great question of the housing of the poor, and perhaps, by promptly exposing the dangers and obstacles that are in the way of thorough and widespread reform, the results may be more favourable than we are at present tempted to anticipate. In any case, it is very necessary that the sanitary reformers at Manchester should not be content to rest on their laurels; otherwise, the improvement about to be realised, the scheme now sanctioned, may be utilised, not as an example to secure other and greater progress, but rather as a scarecrow to frighten the ratepayer and prevent further attempts being made in a similar direction.

THE LONDON COUNTY COUNCIL OFFICES.

THE report of the Offices Committee of the London County Council announces that advantage has been taken of the electric current having been introduced into the office for the lighting of the council chamber, to light by electricity certain of the rooms in the offices in which better means of lighting were much needed. Benefit having been derived by the adoption of the electric light in these rooms, other rooms are now about to be provided with it. Arrangements have recently been made for the better protection of the county hall at night. A fireman is now on duty each night, and patrols the buildings at certain specified times. With a view also to speedy assistance being rendered in case of fire, telephonic communication has been established with the headquarters of the fire brigade. No additional premises have been taken during the past year, but the committee are now in negotiation for the premises No. 31 Spring Gardens, which the special committee on water supply and markets request should be taken in connection with the work relating to the water supply. The request is supported by the main drainage and the bridges committees, who state that the chief engineer urgently needs additional accommodation to enable him to carry out the work of those committees in connection with the new survey of sewers, and the preparation of the contract drawings for the Blackwall Tunnel.

The committee had still before them the resolution of the Council of January 28, 1890, referring it to the committee to consider and report as to acquiring a suitable site for a council chamber and offices, having also regard to any site which already has erected upon it buildings of a character likely to be available for the purpose. The subject has from time to time received the careful consideration of the committee. In the committee's report of last year it was stated that communications had been entered into and a conference held with the City Lands Committee, with reference to the vacant land on the Embankment belonging to the City Corporation; but that the committee had found, however, that until the Council had passed a definite resolution that a site should be acquired for a council chamber and offices, it was not in a position to enter into practical negotiations for the purpose. Acting upon the resolution of the Council passed on January 28, 1890, the committee again approached the City Lands Committee on the subject of the site, and, after a conference with that committee, came to the conclusion that the price asked was too high to justify a recommendation being taken up to the Council in favour of the acquisition of the whole or any portion of the vacant land. Through another channel the question of this land has again been brought before the committee, but no further practical negotiations have taken place. Other sites have been brought under the notice of the committee, and among them are the following—(*a*) Christ's Hospital, (*b*) Site near the British Museum, (*c*) Millbank Prison. Careful consideration was given to each of these sites, but the committee came to the conclusion in each case that the site was not a suitable one for the purposes of the Council.

STANDARD MEASURES.

IT has just been discovered, says the *Times*, that the standard yard and certain other measures and weights supposed to have been lost when the Houses of Parliament were destroyed by fire in 1834 are still in existence. For over half a century they have lain in the Journal Office almost unnoticed, and but for some inquiries recently set on foot by Mr. Bull, the chief clerk, respecting the present standards, they might have remained unnoticed for a much longer period. A reference to the contemporary records shows that after the fire the standard bars of 1758 and 1760 were found among the ruins, "but they were too much injured to indicate the measure of a yard which had been marked upon them." The principal injury to both of the standards was the loss of the left-hand gold stud, but whether this was caused by the action of the flames or otherwise is not known. When the Palace of Westminster was rebuilt the two bars were deposited in the Journal Office, and, until brought to the notice of Mr. Bull last week, they appear to have rested in obscurity amongst a quantity of lumber. On Tuesday they were examined by Mr. Chaney, the Superintendent of Weights and Measures; and on Wednesday the Speaker visited the Journal Office for the purpose of inspecting them.

The chain of incidents which led up to the identification of the old standards is peculiar. About a fortnight ago it was stated in the lobby that one of the duties of the Speaker was to inspect once in every twenty years the standards immured in the sill of the lower waiting-hall. Inquiries at the Standards Department of the Board of Trade elicited the fact that, so far from any statutory requirements being imposed upon the Speaker in the direction indicated, section 35 of the Weights and Measures Act, 1878, which provides for the care and restoration of the Parliamentary copies of the imperial standards, specially exempts the walled-up copy from periodical inspection and comparison. It transpired, however, that in 1871 Speaker Denison took cognisance of the standards, and the natural assumption was that Mr. Peel, who is ever anxious to keep up the traditions of the House, would follow the example of his predecessor. The Speaker's attention was called to the matter; but the ordinary records giving no indication of the procedure adopted by Speaker Denison, and Mr. Palgrave having only a vague remembrance of the circumstance, Mr. Bull was asked if he could throw any light upon the subject. Mr. Bull was unable to discover any reference to Speaker Denison's inspection, but in the course of his inquiries one of his subordinates mentioned that when the contents of the Journal Office were recently transferred to the new wing he noticed amongst the lumber some old weights and measures. These proved to be the missing standards referred to above.

The most important of the standards thus rescued from oblivion are the yard measures constructed by Bird in 1758 and 1760. The former was copied from a bar in the possession of the Royal Society, which was itself a copy of a standard preserved in the Tower, and the second was constructed under the directions of a committee of the House of Commons from the 1758 standard. "Each of these two standard yards consisted of a solid brass bar 1·05 inch square in section and 39·73 inches long. Near each end of the upper surface gold pins or studs 0·1 inch in diameter were inserted, and points or dots were marked upon the gold to determine the length of the yard." The other standards in the custody of the Journal Office are two brass rods answering the description of the old Exchequer yard, and four weights supposed to be certain of the "copies,

models, patterns and multiples" ordered by the House on May 21, 1760, "to be locked up by the clerk and kept by him." The most important weight—the standard troy pound—is not amongst those now brought to light.

Correspondence

The Congress of Hygiene and Demography.

SIR,—As President of the Architectural (No. 6) Section of the International Congress of Hygiene and Demography, which will be opened by the Prince of Wales on August 10, may I be allowed to appeal to members of the profession generally to give their support to the Congress by attending the meetings of our section as largely and as frequently as possible, and by taking part in the discussion of the various interesting subjects which will be brought forward. As the programme of these has already appeared in all the professional journals, I need not now repeat it, but I may remind your readers that the meetings of the section will be held daily at 10 A.M., from Tuesday the 11th until Friday the 14th inclusive, in the West Examination Hall of the University of London, Burlington Gardens. Tickets of membership, which will entitle the holder to a copy of the "Transactions" and admission to some of the social receptions, can now be obtained at the honorary secretary general's office, 20 Hanover Square.—Faithfully yours,

ARTHUR W. BLOMFIELD.

8 Montagu Place, London, W.: July 21.

Sculpture in England.

SIR,—Having spent much time and effort in procuring data concerning equestrian monuments, it has occurred to me that the readers of *The Architect* might be able to furnish me with facts and illustrations concerning any piece of equestrian sculpture not enumerated below which exists in the British Islands; and that, as the matter comes somewhat under the classification of curious information, you might be willing to publish in *The Architect* the following list of sculptured subjects, concerning which I have already gathered the necessary material. Patient research on this side of the Atlantic has disclosed the fact that the following complete works are still to be found in England, namely, in London:—"Richard I.," by Marochetti; "Wellington," by Boehm; "Wellington," by Chantrey; "Charles I.," by Lesœur; "George III.," by Wyatt; "George IV.," by Chantrey; "Prince Albert," by Bacon; "William III.," by Bacon. At Aldershot—"Wellington," by Wyatt. At Windsor—"Charles II.," by Strada; "George III.," by Westmacott; "Prince Albert," by Boehm. At Bristol—"William III.," by Rysbrach. At Hull—"William III.," by Scheemaker. At Liverpool—"Prince Albert" and "Queen Victoria," by Thornycroft; "George III.," by Westmacott. At Halifax and Wolverhampton—Copies of Thornycroft's "Prince Albert." At Durham—"The Marquis of Londonderry," by Monti. At Chester—"Marshal Combermere," by Marochetti; "Hugh Lupus," at Eaton Hall, by Watts.

In Scotland there are these:—At Edinburgh—"Wellington," by Steell; "Charles II.," sculptor unknown; "Prince Albert," by Steell; "Earl of Hopetoun," by Campbell; "Alexander and Bucephalus," by Steell. At Glasgow—"Wellington," by Marochetti; "William III.," unknown; "Prince Albert" and "Queen Victoria," by Marochetti.

In Ireland there are:—At Dublin—"George I.," by Van Ost; "George II.," by Van Ost; "George III.," unknown; "William III.," unknown. At Belfast—"William III.," by Hems.

To these portrait groups may be added the following subjects, more or less dependent on imaginative effort:—"A Moment of Peril," South Kensington Museum, by Brock; a group of "Huntsman and Hounds," at Eaton Hall, by Smith; "Perseus and Andromeda," on a fountain at Witley Court, by Forsyth; the two monuments to General Ponsonby, by Baily, and General Abercromby, by Westmacott, at St. Paul's Cathedral; another group contains, "Clydesdale Stallion," at Luton Hoo, by Boehm; "Doncaster and Groom," at Eaton Hall, by Boehm; "King Tom," at Mentmore Park, by Boehm.

Groups which have never been carried any further than the model include:—"Lady Godiva," by Birch; "The Mourners," by Lough; "St. George and the Dragon," by Boehm; "Lady Godiva," by Thomas; "Wellington," by Adams.

And the following models made for the Blackfriars Bridge competition:—"Edward, the Black Prince," by Story; "Richard I.," by Brock; "Edward III.," by Armstead; "Cromwell," by Pinker; "Edward I.," by Thornycroft; "Edward III.," by Brock; "Henry V.," by Birch; "Edward, the Black Prince," by Belt; "Richard II.," by Pinker; "Sir Robert Fitzwalter," by Adams.

To these should be added the casts in the Crystal Palace of:—"General Outram," by Foley; "Francis I.," by Clésinger; "Colleoni," by Verrochio; "Queen Victoria," by Marochetti; "St. George," at Prague.

And there should also be included the "Caligula," in the British Museum; "The Tomb of Malaspina," at South Kensington; a copy of "Marcus Aurelius," on the arch at Wilton House.

If any of your readers can help me to complete this list of executed or unexecuted work I shall be extremely beholden to them, and shall not scorn information concerning statuettes, such as "The Last Call," by Birch; or bas-reliefs, such as the group of "Hercules and the Horses of Diomedes," on the Mews at Buckingham Palace; or such mortuary memorials as the bas-reliefs of the "Queen's Ninth Lancers," at Exeter Cathedral; or that in honour of the "Crimean Cavalry," in St. Paul's. Information concerning equestrian sculpture that has passed out of existence would also be welcomed by—Your obedient servant,

WM. ROTCH WARE.

Office of *American Architect*,
211 Tremont Street, Boston.

GENERAL.

The Awards to the exhibitors at the Jubilee Art Exhibition at Berlin comprise seventeen large and seventy-three small gold medals. Among the British artists who have received the large gold medal is Mr. A. Waterhouse, R.A.

Mr. J. H. E. Partington, according to a correspondent of the *Manchester Guardian*, has been appointed to the position of Art Director to the National Gallery of the Colony of Victoria, Australia, at a salary of 600*l.* a year, rooms provided, and the right of private practice. Since Mr. Partington left Manchester with his family he has been residing in San Francisco.

The "Standard" says:—Professor Encke, the sculptor, has finished the model of the intended statue of the Empress Augusta, which is to be placed in the mausoleum at Charlottenburg.

Mr. Whistler has been at work lately upon a large and interesting series of drawings in pastel for exhibition.

Royal Academy Architectural School.—The following students have been admitted to the Upper School:—Messrs. H. C. Corlette, J. Paxton, J. S. Stewart, A. F. Usher, and E. W. Wonnacott. Messrs. E. R. Barrow, H. Bulman, A. J. Forge, A. Hill, C. O. Law, H. Tarbolton and J. H. Tyars have been admitted as Probationers.

The Mosaics of the church of St. Christopher discovered at Kabr Hiram, near Tyre, by M. Renan in 1863, are now being placed in the Mollieu Room of the Louvre.

"General" Booth stated at a departure meeting in Exeter Hall on Tuesday that it was proposed to take a site at 10,000*l.* a year rent on which to build a great "International Salvation Army Temple," at a cost, in round figures, of 200,000*l.*

Mr. Bousfield (of the firm of Fox & Bousfield) sold by auction, at the Mart, Tokenhouse Yard, on Wednesday, the site of the church of St. Olave, Jewry, together with the fabric thereof, for the sum of 22,400*l.*

The south-west portion of the Bishop's Palace, Elgin, adjoining the cathedral, one of the most interesting of Scottish ruins, has collapsed. The palace was lately handed over by the Dowager-Countess of Seafield to the Town Council.

The Old Custom House in Greenmarket, Dundee, an example of the architecture of the sixteenth century, is being demolished by the Police Commissioners, in consequence of the building being in the line of a projected new street.

A Bazaar has been held at Ellon in aid of the building fund for a Volunteer and Public Hall, proposed to be erected at a cost of 1,000*l.*

The Subscriptions to found a cottage hospital for Galashiels and the district have reached 2,120*l.*, and it is expected that 3,000*l.* will be obtained before the books are closed.

In View of the damage done to churches lately by lightning, the Dean and Chapter, to protect the tower of Gloucester Cathedral, have fixed a rope wire conductor to the south pinnacle of the tower.

Paignton Promenade Pier, which was constructed in 1879 at a cost of 10,000*l.*, has lately been sold by public auction. The biddings started at 3,000*l.*, and the property was knocked down for 3,700*l.* to Mr. Jasper Bartlett.

Sanction has been given by the Edinburgh Dean of Guild Court to St. Cuthbert's and Dean School Board to erect a new school at Comiston Road to accommodate 600 children. The cost of the work, the plans of which have been prepared by Mr. Robert Wilson, architect, 3 Queen Street, is estimated at 8,900*l.*

The Architect.

THE WEEK.

The decision in the House of Lords on Tuesday determines one of the questions which the Employers' Liability Act left open, and which has puzzled English and Scotch courts; that is to say, what rights are gained or lost by "common employment." In modern building construction sub-contracts and quasi-independent contracts cannot be avoided, and as accidents may happen in connection with them, questions of responsibility arise. Heretofore, owing to the uncertainty of the law, settlements have been made by the evasion of the main principle. Thus, when a sub-contractor's man has been injured through some neglect that under ordinary circumstances could be attributed to the general contractor, compensation has been given in the form of charity, a receipt being secured that was entirely expressive of gratitude for a favour conferred. When the accident was even remotely chargeable to the sub-contracter, there was less difficulty about settlement—that is, assuming he was able to pay, for sub-contractors generally are considered as interlopers, and they wish to avoid anything which is likely to excite prejudice among the contractor's men. As regards the chances of an accident, they may be considered as being against men who work on sub-contracts. In the case before the House of Lords the accident was caused by the fall of a bucket containing concrete, which was being raised by a sub-contractor's workman, and the man who was injured was employed by the general contractor. He brought an action against the sub-contractor, and a jury, looking at the facts of the case, awarded 52*l.* 10*s.* The Divisional Court set aside the verdict on the ground of common employment, and that view was confirmed by the Court of Appeal. However, the House of Lords came back to the original decision, and the award of the jury was upheld.

It is difficult to reconcile a builder's or workman's idea of common employment with that which has been held by the majority of judges. In ordinary cases of employment it is assumed that a workman is able to measure the risk he runs, and his pay thus represents that risk as well as compensation for labour. If he sees defective plant, or has to do with overseers that are careless of the consequences of incurring danger, the law supposes he is free to seek safer employment. He has had opportunities to gain knowledge of the men and things that he has to deal with, and if he remains indifferent he is not to expect that protectors will be found for him. The Courts cannot treat men as if they were mere bales of goods, and a good deal of the disappointment which follows actions under the Employers' Liability Act arises from the plaintiffs discovering that they are held to be free agents and competent to avoid danger to themselves. But in the cases of their working on sub-contracts all the conditions are changed. There is mutual ignorance. A workman who may be employed for many weeks on a building discovers suddenly that a sub-contractor or specialist is beginning operations. How is he to test the risks which are introduced? The work may be novel to him, and he is not permitted to interfere with it in any way. On the other hand, the sub-contractor's men are confined within certain limits of space, and they are liable to pains and penalties if they stray elsewhere. There is little or no co-operation between the two sets of men, and not seldom there is ill-feeling. The judges observe that the sub-contractor or specialist is generally paid through the general contractor, and hence assume that the former is only a sort of director or foreman for a temporary purpose. But it is not easy to understand how arrangements (which are often fictitious) between general and sub-contractors can affect men who have no cognisance of them. This is the view taken by the House of Lords, and it is satisfactory for many reasons. It is quite enough for an employer to be responsible to his own employés, and for the latter to avoid the risks which arise in their own business.

In the *Daily Graphic* of Tuesday, the 28th inst., are three drawings in connection with the proposed extension of monumental space at Westminster Abbey. In one Mr. H. P. Burke-Downing has delineated in his clever characteristic style the memorial chapel as proposed by Mr. J. L. Pearson, R.A. Mr. Seddon's scheme comes next, and in the third place a plan of the Abbey and precincts, showing the alternative sites for a proposed monumental chapel. Mr. Downing concludes the note that accompanies the sketches by saying:—"If I were one of those for whom the new memorial chapel is being proposed, I would ask no better than to be laid in the cloister garth, though my memory received but a tablet on the cloister wall."

The Rev. Canon Grainger, D.D., of Broughshane, has presented his valuable collection of British and foreign antiquities to the public museum in the free library of Belfast. It will be necessary to build an addition to the free library buildings in order to properly accommodate the collection. The floors of the library, it is said, are not sufficiently rigid to sustain such an additional weight, but there will be little difficulty in introducing stronger beams. The arrangement has commenced, but as it will be necessary to prepare special cases, and the classification will be onerous, some time must elapse before the people of Belfast can enjoy the new acquisitions.

The West Sussex County Council have decided to employ the whole of the money available from beer and spirit duties in aiding technical education. As the Council was the last to come to a conclusion, it is known, therefore, how all the counties will deal with the surplus. The majority will give the money for technical instruction. Gloucestershire, Staffordshire, East Sussex, the North Riding of Yorkshire, Leicestershire and Herefordshire have resolved to use only a part of the surplus for that purpose. Middlesex and the county of London, for the present at least, will not contribute towards technical classes. Nearly the whole of the Welsh counties will also support them. There is no doubt that for a time it will be difficult to produce advantageous results from the outlay. In country districts adults and young people are not disposed to renew their experiences with teachers, and it may be long before a system of instruction is organised which will be at once attractive and profitable to the provincial mind.

It is not often the memorial of a surgeon can have any interest for an artist or a lover of art, but a statue was unveiled on Sunday in the French town Bernay which deserves to be one of the exceptions. It represents Jacques Daviel, who in the eighteenth century was the first oculist in France, and the portrait which was used by the sculptor was produced out of gratitude by one of the patients. Daviel was an expert in the extraction of cataract; in fact, he was the earliest who was able to prove the success of the operation in a great many cases. It happened that a young sculptor named De Vosge was treated by the older method, and one eye became useless. He had recourse to Daviel, and implored his aid. The oculist was then renowned, and could command extraordinary fees. But he took pity on the artist, and succeeded in curing him. The first use De Vosge made of his restored sight was to design a plate, which, after the manner of the time, represented Daviel proceeding to the Temple of Fame, escorted by Genius and Invention. It was from a copy that the sculptor, M. Guilloux, modelled the statue. De Vosge was surpassed by the pupils he taught. One of them was Prudhon, who at a time when revolutions were brewing, produced figures of amorini which neither Albano nor Stothard surpassed. He seemed to live in some ideal world. But the paintings in the Louvre, *Christ Expiring on the Cross* and *Crime Pursued by Justice and Vengeance* are evidence that his master taught him some of the secrets of tragedy. Another pupil of De Vosge was François Rude, the sculptor of the great relief on the Arc de Triomphe, and other works less renowned. A third pupil was Ramey, who executed some of the sculpture of the Arc du Carrousel, which has survived the burning of the Tuileries. De Vosge, therefore, may be said to have endowed France with at least two great artists, and without the aid of Daviel that would have been an impossibility.

ARCHITECTURE, MODERN AND INDIAN.*

WE suppose every reader of this page is well acquainted with the shortcomings of the "History of Architecture," by the late JAMES FERGUSSON, and therefore it is not necessary to say much about the volumes. They form a work which could have appeared in no other country but England. The author was an amateur, whose study of the art was gone through in India, and who judged all things artistic by an Indian or semi-barbarous standard. His books were addressed mainly to students who were to become practitioners of the art, and yet his ambition was to degrade them and the men from whom they were likely to derive inspiration. But in England people are tolerant, and the books in which his extravagances were most marked brought him most profit. Those that were intended for the instruction of Indians and English officials in India were failures. FERGUSSON of Calcutta was not a name to conjure with, even when the subject was as simple as caves or "topes."

In England a man who sets up as an oracle somehow finds believers among people who are wiser than himself. When FERGUSSON declared that all Europe could not show a single architectural building erected in post-Reformation times that was perfectly truthful, men who were well acquainted with the towns of Europe dared not demur to the statement. When he contrasted Indian methods of building with English, and announced that "in the East men still use their reason in speaking of art and their common sense in carrying their views into effect; they do not, as in modern Europe, adopt strange hallucinations that can only lead to brilliant failures; and in consequence, though we may feel inclined to despise their results, they are perfection itself compared with what we do, when we take into account the relative physical and moral means of the Asiatic and the Anglo-Saxon," he so captivated statesmen in authority that he was appointed "Inspector of Public Buildings and Monuments." Happily, he was not allowed many opportunities to introduce Indian methods in building works. Nor so far as is known did he agree to accept an Indian rate of remuneration for his valuable services, or the pay which satisfied that "extraordinary man," ANGELO GATT, the architect of one of Mr. FERGUSSON'S pet churches in Malta, who for twenty years gave his whole time in return for fifteen-pence a day, while latterly he was blissful with two shillings, which formed a pension and a salary.

GATT and great artists like him are the heroes of Mr. FERGUSSON'S architecture, for underlying all his attempts at reasoning there is something that is financial. The men who are unworthy of the art, according to his view, are those who are eager to be paid at a reasonable rate for their services. We have only to read between the lines and we can understand why he objected to "a limited and especially educated class of architects," whose "productions are appreciated only by a small class of scholars or archæologists," for, of course, specialists will not work for a handful of rice or a few pence. To the FERGUSSON mind, on the contrary, what does it matter if in a public building "the pillars were one diameter more or less in height, if the proportions of the entablature were altered, and even if the cornice were half or twice its proper projection," so long as cheapness is secured? The ideal building is one like the cathedral at Boulogne, which a simple Abbé erected and which a FERGUSSON could imitate. To an educated man it is admitted the building is "simply horrible," but to the inhabitants "it is a more beautiful building than the Walhalla or the Madeleine, because it has the form of a Christian church, which they understand, and because its parts answer the constructive purpose for which they were designed," to say nothing of the saving which the simple Abbé effected through being his own architect. In writing his history the author showed that he retained the characteristics of the Indian traveller in 1839, who boasted about "the great and wealthy Mr. FERGUSSON" doing everything for himself, down to making his own bed and cooking his own dinner. He was as ambitious to play many rôles as BILLY BOTTOM himself, and architecture he considered was one of the least important, for as he said once, and he was versed in the manipulations of the kitchen, "Identically the same process which makes the difference between a boiled neck of mutton and a dish of *côtelettes à l'Impériale* can convert the most commonplace building, merely designed for shelter, into a palace or a temple." In the pages of his book he tries to show how well he could have acted as a substitute for the most renowned architects since the dawn of the Renaissance, and when criticising he appears to say, "If I could only have had such materials, what a wonderful hash would be produced!"

It may seem puzzling that, with so many defects, the "History of Architecture" should have gained so much success. The reason is simple. The author in almost every page exhibits his deficiencies, but at least he is consistent in what he writes. Mr. FERGUSSON does not bestow blame or praise to order; all his judgments are his own. We may consider him to be over-vain and unqualified for his office, and what he lays down will not sustain examination; yet nobody can doubt that he is honestly inspired. With a different sort of training his critical faculties would have been more fairly balanced, and he might even have lost some of the faith in his own infallibility. Fortunately he was not skilled in the art of explaining the course of his thoughts; he was unable to do more than lay down his law in a sort of bow-wow manner. The student soon learns to detect the weakness, the criticisms are questioned, and if their groundlessness is easily discovered the process is not without use for beginners. It is remarkable how rare are the occasions when anything said by Mr. FERGUSSON about modern architecture is referred to as authoritative. As they grow in experience students lose their faith in him, and his work is more often referred to for its descriptions than opinions.

It was no easy task, therefore, which was imposed on Professor KERR when he was entrusted with the editing of the "History of Modern Architecture," and what he has done reveals the defects of the original. When he says "as regards the original text of the work it has been thought best to make no alteration whatever," it is evident that it was considered hopeless to bring the author's ideas into harmony with the editor's, and the Professor was only true to himself when, as he says, "he confined himself to the task of introducing occasional comments, with the object not of correcting the author, but of accommodating his bold and forcible opinions to the modified thinking of the present day, and perhaps to the practical experience of the working architect." The advantage of the arrangement is that Professor KERR in his numerous additions is enabled to express his own opinions frankly. He does not act after the manner of the modern showman or "illustrator," who tries to discover all that can be said in a limited time in support of his subject, and who passes lightly over all that is apparent on the other side. Professor KERR does not forget the duty that he has incurred, but while very courteous to his author, he never ignores what is mischievous in the volumes. In consequence the pages now seem to be inspired by two opposing spirits. One is very bumptious, with the narrowness that comes from self-formation and a tendency to exalt conclusions from immature data into universal truths; the other is less confident by reason of a wider experience which shows that theories, like men, must undergo changes. Mr. FERGUSSON, as became a man who was spoiled by his family, by servants that were little better than slaves, and by sycophants who were rather worse, appeared to think he was a born legislator, and the world would not go right until there was a clean sweep of everything he disliked and a reconstruction under his own superintendence. Although his writings, as we have said, were never accepted for guidance, yet we believe that indirectly his manner of criticism has had a pernicious effect on many students. Professor KERR, on the other hand, who in his day was not sparing of criticism, evidently now believes that when it is one-sided it is not a profitable indulgence, and the following bit of advice will, it is to be hoped, serve as a corrective for many of the pages of the history:—

> It would be useless and only what is called old-fashioned, or even pedantic, to pretend now to criticise by means of academical canons the artistic merits of current examples: the prodigious cultivation of the picturesque has ruined criticism. The only thing, perhaps, that

* *History of the Modern Styles of Architecture.* By James Fergusson, D.C.L., F.R.S., &c. Third Edition. Revised by Robert Kerr, Architect. London: John Murray.

History of Indian and Eastern Architecture. By James Fergusson. London: John Murray.

may be safely attempted for the present is the enforcement of broad precepts of obvious propriety. That every building ought to be most carefully devised and organised for the strict fulfilment of its purposes of occupation is the very first point; and here the occupants must generally be allowed to be witnesses. This rule, moreover, will be found to reach a great deal farther than most of our artistic architects may suppose. The frank acceptance of such forms and features of conventional art as shall be perfectly appropriate, straightforwardly truthful, and unaffectedly graceful, may be relied upon as another rule; and especially that the common sense of the many should not be outraged by any uncommon sense of the few. Intoxicated architecture may always be rejected; ambitious architecture may be at least regarded with suspicion; paper architecture is worthless—that in which the fascinating touch of the draughtsman is the chief or sole source of pleasure; quaint or funny architecture is almost invariably a delusion, concealing the architect's want of care or want of genuine skill. Science never jests. On the other side of the question, however, we ought, even in this kind of criticism, to cherish liberality of feeling, and, if only as matter of expediency in such unfavourable circumstances, forbearance and modesty in delivering an adverse judgment. Who are the critics whose laugh has been loudest in our day? Not the most learned students in the libraries, not the most able craftsmen in the studios. The pen of the ready writer in censorship, especially that of the amateur, is all too ready to run away with its master. The more we cultivate that generosity of judgment which pertains to elevated thought, the sooner our coming canons of taste will come. Error on the safe side in this particular matter is not reluctance to admire, but unwillingness to blame. Leaving out of account, of course, that which is unmistakably otherwise, let us always bear in mind that the work before us has cost its author pains, that his aim has been to please us, and that every blade of grass, however feeble, helps to make the swathe of hay.

The English section of the History of Modern Architecture was closed by its author at a time when Gothic was in the ascendancy, although the laity seemed to prefer the Classical styles. Mr. FERGUSSON's hope was in the reappearance of "a *tertium quid*, a style which, for want of a better name, is sometimes called the Italian, but should be called the Common Sense style." As we know, that consummation continues to be devoutly wished for. Professor KERR does not take up the historical narrative after the completion of the Houses of Parliament and the erection of the Museum at Oxford, which exemplified Ruskinism when strongest. He sees in work of the present day, in our latest form of architecture, that the crafts are not only employed, but sometimes become supreme, and therefore he turns back to the Hyde Park Exhibition of 1851, when they were first allowed to assert themselves publicly, and sculpture alone among fine arts became admissible because it was supposed to be allied to them. Here is a passage in which he shows the effect of industrial art at large:—

The most promising course to adopt in any attempt to trace the progress of architecture throughout the world in the Victorian era would be to note its condition in each of the great communities at the year 1851, and from thence to follow its local progress with express reference to *industrial art at large*, comprehensively, popularly and non-academically. As regards England the consequence of such a study must be this. We soon leave behind us the constrained and pedantic "Fine art of Architecture" of the academical books, applying itself to certain accepted kinds of the dogmatically-glorified building, and to nothing else. We find ourselves in a far wider sphere of influence. The very formula of Royal Academies—the Renaissance formula of "Painting, Sculpture and Architecture"—changes its significance. Architecture, more especially, steps down from her academic pedestal and welcomes to her embrace a whole family of non-academicals. "Minor arts" is what they have been called hitherto, supplementary arts, subsidiary arts and so on, mere ornamental and decorative arts, inferior arts, commonplace industries. *Architectural art* now embraces them all, no longer of unequal dignity with herself, but of altogether equal and similar comeliness of grace. Bone of her bone, indeed, and flesh of her flesh, they group themselves, as they have always done, around the ancestral central art of building, but they are constituents now and colleagues, not poor retainers and subordinates. We have only to think for a moment of the generous philosophy of this unity, and what must follow is precisely what we see. The English architect of to-day has for his fellows and fellow-workers no longer the dainty dilettante only, or the pious ecclesiologist, but all those popular handlers of the pencil—the same pencil as his own—the decorator, the colourist, the ornamentalist, the glass-painter, the modeller, the carver, the statuary, the metal-worker, the furnisher, the tissue-worker, the clay-worker, the plaster-worker—in short, the whole order of those designers who produce *art architectural*, amongst whom he is sufficiently proud to be, as his name implies, *Architectus* only, technical chief.

If Mr. FERGUSSON could have his way architecture would be an art without artists, or at least any that were acknowledged. As a gourmand he would argue that it was only in exceptional cases a cook was allowed to associate his name with a sauce of his invention, and why should architects gain credit and fame for combinations of forms which they had not originated? That history is the record of what was said and done by individuals, and that the individual element cannot be too prominently expressed, he could not admit as being true in architecture. Mr. FERGUSSON wished to ignore the architect while considering his work. He complained "that hardly any one has attempted to write a continuous history of the Renaissance styles of architecture, but VASARI, MELIZIA, DE QUINCEY and many others have written the lives of the most eminent architects," and, while admitting that such "lives" found readers, he added, "it is only so because the art is cultivated on mistaken principles which can never conduce to progress or lead towards the attainment of perfection." In order that the reputation of architects might be effectually suppressed, Mr. FERGUSSON set up the wonderful theory that their art, in common with tailoring and cooking, was a technical art in which men served as substitutes for machines, while it is only in the phonetic arts that authorship was of importance. In technic arts such as architecture "the individual is nothing, the age everything; if a giant does occasionally appear he only makes a rapid step in advance, which would be accomplished as certainly, though more slowly, by ten dwarfs." Professor KERR has no rancour to gratify by undervaluing architects, and in his additions he endeavours to counteract the defects of the original work by showing, as far as space allows, the relations between the idiosyncrasies of an architect and his buildings. The following estimate of two prominent Gothicists will suggest his method:—

Burges and Street were men of a highly artistic temperament, but they were as unlike each other in every way as any two such men could well be. Burges was personally very much of a Bohemian, whimsical to absurdity, paradoxical, pedantic and perverse, but possessing singularly refined powers of elegant, contemplative, and what is called poetic design, with a leaning towards nicknackery. Street, on the contrary, was robust, bigoted and domineering; a solemn fighter, armed *cap-à-pie*, and with no weakness at all—except excess of strength be weakness—having a positive disgust for the elegancies and graces, and a sort of delight in architectural uncomfortableness, which it was impossible not to admire because of the vehemence of it as an act of sacrifice. Both had a radical and contemptuous distrust of the nineteenth century in respect of all its ways and works, but their conceptions of the thirteenth or fourteenth were essentially different. Street might have been a building abbot, ruling with a rod of iron, if ruling well, or a building baron, sealing his delineations with the hilt of his sword; while Burges would have been neither priest nor warrior, but some eccentric wandering star of infinite jest and humour. That Burges was the more refined artist the majority of pleasant people will probably maintain; but that Street was more grand there will be some hard-mouthed admirers of the severities of art with equal emphasis, or even more, to affirm. At any rate, Burges loved the amenities and sunshine of Mediæval art, Street its austerities and clouds. That they had a pretty correct appreciation of each other's shortcomings need scarcely be said; they were always competitors, never comrades, both great architects.

All portraiture is affected by the authorship, and it does not follow necessarily that all the touches in the foregoing are true to nature. But we maintain that it is a better aid to students who wish to understand what are the qualities which differentiate STREET's work from BURGES's than if told that "our present mistake is, first, in insisting that our architects must be archæologists, and fancying, in the second place, that a man who has mastered the science is necessarily a proficient in the art." Professor KERR gives a sketch of another remarkable man who, like BURGES, and in spite of what Mr. FERGUSSON asserts, failed to convince the bestowers of commissions that a mastery of science and an enthusiasm for archæology could coexist with proficiency in the art and practice of building:—

Fergusson used to say of Digby Wyatt that he had never seen his like in this very remarkable respect:—Give him any conceivable subject of architectural work, and dictate to him any style you pleased, he could without a moment's hesitation sketch off a design in all its detail which would be perfectly correct and perfectly complete. In other words, his mind was a storehouse of all the knowledge that was to be obtained from travel and the books. This could be said of him, moreover, with reference not to academical architecture alone, but to Architectural Art in the widest sense, embracing all the supplementary and subsidiary arts that could be named. Speaking more strictly, however, it was his knowledge of academical Renaissance Art in all its departments that was so intimate, and he only added to this for its own sake a similar but of course not equally profound appreciation of the most approved examples of other schools—a little Gothic included, but not too much. Academical he was to the core, but his academicalism was so broad that it was practically of the same revolutionary character as Coles's democratic republicanism of artisanship. With all "the industrial arts" at his fingers' ends, despising none,

almost preferring none, here was the very man Cole wanted, a loyal and tractable man also, and not a vain man like too many of such artists, glad of the opportunity to exert himself and to earn honour more than money. Years afterwards, when he asked the Metropolitan Board of Works to give him a District Surveyorship for a living, his testimonials, it is said, made such a grand array as to frighten the members; they would have nothing to do with so glorified a candidate, and he never applied again; but he eventually obtained the better appointment of architect to the East India Company; and if Sir William Tite, who took up the matter, had not, in his own rough way, done many another handsome thing, his action in this ought to be allowed to cover a multitude of sins of the more commercial order.

It must not be supposed that Professor KERR is one of those zealots who profess to believe that under no circumstances can an architect go wrong. There are, unfortunately, too many men of that class, each of them being convinced that when he blunders it is the bounden duty of all architects to come to his aid by maintaining, against the world, that so long as an architect is not dissatisfied with what he does, clients and the world in general have no right to interfere. Professor KERR takes one case which affords as good a text for a sermon to young architects as could be found: it is that of the new Post Office in the City which stands opposite SMIRKE'S building, and was designed by Mr. WILLIAMS, of the Office of Works. The Professor says:—

Most architects were offended when that important edifice was not only projected without a competition, but carried into execution without any architectural direction, except that of the unconspicuous officials of the Public Works Department. It was pronounced, even by the most moderate men, to be an opportunity thrown away. Now the exterior design is certainly not of those polished artistic proportions which would have cost nothing but pains and skill. The interior may perhaps be worse in that respect than the exterior. But compare the building as an organic device with the old Post Office on the other side of the way, a work of which Sir Robert Smirke was considered to be justly proud, or with the same architect's British Museum, or with Barry's Houses of Parliament, or with Street's Law Courts. In each of these cases, how much of the common sense of careful disposition and expressive appropriateness, of the repose of usableness, of the indescribable completeness of perfect convenience, has been deliberately and (as many very good people would plainly say) maliciously compromised for the sake of—what? No one knows what, except academical architects, and even they are not of one mind about it. In a word, the idea that has become fixed in the minds of such men of business as are at the head of our national affairs seems to be very much like this—that an architect, when entrusted with any important work, begins at the wrong end, and, as an inevitable consequence, misses the proper object of the enterprise; begins with style, fashion, masquerade, histrionics or whatever we may choose to call his perverted desire for spurious display, goes up at the beginning like the rocket and comes down at the end like the stick. This is, no doubt, putting the case strong, but it requires to be put strongly, for there cannot be any reason why English architects and the English Government should not be able to act in harmony, if the architects will only consent to do their work (as the phrase now goes) scientifically, beginning with the skeleton and ending with the skin.

Nobody will resent plain speaking on the part of Professor KERR, for he knows the state of the profession, and is aware that it is not the Government alone that can complain about the sacrifice of utility to appearance, and the neglect of the comfort of residents for the sake of the occasional admiration of a front by the passers-by. He can be no less severe than Mr. FERGUSSON in dealing with indifference to the real purpose of a building, but unlike him Professor KERR could not have the hardihood to say that when an architect succeeds in producing "one of the best public buildings of the metropolis," that is, the prison of Newgate, it was through "mere ignorance," and that "it was just this amount of ignorance which enabled every village architect in every part of England to produce those perfect churches which our cleverest and best educated architects find difficulty in copying, and scarcely even dream of surpassing!" When a vulgar man does try to become paradoxical, it is astonishing to what depths he can sink.

It is evident from several passages that Professor KERR is no longer in allegiance to academic architecture, and the phrase may be supposed to suggest much that was mechanical if not lifeless in architecture. At the same time he will disappoint many who have also emancipated themselves from academicalism by what he says of Queen Anne. Thus, in one passage he writes:—

The buildings actually executed in the Queen Anne style have been numerous and of all kinds, good, bad and indifferent—mostly indifferent. In commonplace examples, red brick has been the favourite material, and red tiling has been largely added in the form of prominent roofs. Ornamental gables, sometimes of enriched and sometimes of very impoverished effect, seem to be regarded as the leading feature of the mode, with all kinds of dormers by way of supplementaries, as if garrets were the most characteristic part of the accommodation. Huge chimney-stacks, also, are thrust into view with the utmost hardihood, making them often the principal means of investing the composition with artistic merit—surely not of a high order. Wooden bay windows are deemed so essential that they are actually recessed into the wall rather than they should be omitted. Paltry doorways and incomprehensible little windows enter their protest against dignity without, and "nooks" and "ingles," twisted passages, breakneck steps for the sake of the questionable pleasure of surprise, and tipsy arrangements generally, carry out the same scheme of artistic merriment within. Breadth of treatment and repose are understood to mean the introduction of an occasional expanse of ostentatiously plain brick wall, or two or three windowless storeys in a shapeless tower, as a foil to the aspect of pleasantry elsewhere; and when the window-sashes are made like the lattices of a fancy bird-cage, and all the external woodwork painted with the brightest of white lead, after the manner of a doll's-house, the domestic virtue of "the Queen Anne style" is at length fully asserted. In far better work than this, and in the hands of really good artists, the detail is still so coarse and corrupt—for the sake of "quaintness"—that even careful proportions and graceful forms fail to redeem the character of the composition; and it is doubtful whether any specimen of the style above the rank of a country cottage will withstand the commonest criticism twenty years hence. But, nevertheless, there is one respect in which we may accord a certain amount of praise to this singular fashion. The dainty, ladylike, furniture design of some of the interiors is certainly more than pretty; it is minor art *in excelsis*. Whether it is high-class architecture is quite another question; but it fully illustrates the principle that academical pretension is giving way before the advance of the popular appreciation of art, more enjoyable because more simple.

After reading the foregoing extract there is likely to be some doubt about the sincerity of Professor KERR'S conversion, and he has yet to give proofs that he can be loyal to Queen Anne. A style of the kind that is now so much in vogue may be supposed to have advantages, for extravagancies often gain admiration because they are believed to be originalities. Amidst so much competition as prevails in our time there is risk in repetitions, no matter how perfect may be the forms. Clients prefer remarkable to refined details, and even in cheap terraces expense is incurred to secure variety. It would be better if people could be brought to understand what are the limits of architectural design, and for that reason the following remarks by Professor KERR merit general attention:—

The reader's idea of what "copying" means in architectural designs will depend very much upon whether he himself is, or is not, a working designer. To the amateur critic resemblances often appear to be striking which to the experienced artist are scarcely discernible. This is a well-known fact in simpler matters. The average Englishman, who regards himself as a most discriminating observer, thinks all Chinamen are alike. But it is also well understood that the equally self-confident Chinaman thinks all Englishmen are alike, and is even more amused at the likeness. How many intelligent people there are who will tell us any day that St. Paul's in London is almost exactly like St. Peter's in Rome, and was, in fact, "copied" from it, only on a reduced scale! There is no doubt about the circumstance that the Scotch Church in Regent Square, Bloomsbury, a work which Sir William Tite in his very young days won in competition, was considered at the time to be a direct "copy" of York Minster, and so good a copy that even genial Professor Donaldson, half a century later, reminded a large assembly of architects, to their great amusement (it was after dinner), that Sir William had been "the leading Gothic architect of the day." None know better than the leading Gothic architects of the present time how readily their clients and others see resemblances where every effort has been laboriously expended upon the achievement of novelty.

In spite of all the advice that may be given, it is to be feared that many a year must elapse before architectural practice in Europe is unhampered by prejudices which arise from ignorance and those which are caused by the obliquity and preposterous conceit which characterised such men as Mr. FERGUSSON. But in America there is a more open field, and the architects have been able in consequence to advance more rapidly than is possible in England and Europe. Mr. FERGUSSON, who would have the caste system introduced among architects, and who considered that any architect who could read, write, draw and admire plans of buildings deserved severe punishment, had the instinctive aversion of all petty tyrants to American ways. The most absurd part of his book is that relating to North America. It is not only unjust to the Americans but to English readers. Professor KERR offers a special apology for the hasty opinions that have been so freely expressed by Mr. FERGUSSON. The editor traces the progress of architecture in the States during the past forty years, and he takes the view of all careful observers, and

recognises the fact that if the development of English architecture is to be followed America must be included in the survey. But it must not be assumed that the Americans will always be willing to follow a course that is not far apart from our own. There is much to be said in favour of the possibility of such a vision of the future as Professor Kerr opens for us when he says:—

Thoughtful Germans and Italians, and even Frenchmen themselves, are already pleased to express a most significant satisfaction with the art works of the English; and in architecture especially, in spite of our many disadvantages, such approval is by no means grudgingly accorded. "Westward the tide of empire holds its way"—what shall we say of America? Practically the case stands thus:—The leading men in the United States are Englishmen on the other side of a somewhat wide ferry; indeed, New York seems to be much more in touch with London than Dublin is, or even Edinburgh. This being so, let us observe how distinctly the English peculiarities are being emphasised and intensified in the typical Transatlantic character, so that already the doctrine is recognised by leading statesmen and men of affairs that the future of England is best to be foretold by studying the advance of America. May we say that the Gothic vigour of the Teuton parting company with the enfeebled refinements of the Latin, and collecting all its energies at last on this westward island of ours, has simply been forced to bridge the Atlantic for elbow-room, and, amidst the expanding potentialities of a truly new world, where the trammels of tradition are entirely shaken off, is of necessity exhibiting expanded powers? We do not require to look far into the future to see that the next century must work surprising changes in the culture and wealth of the Anglo-American race; and to say that the effect upon the arts—which always follow culture and wealth—must to a certainty correspond, is but a truism. Moreover, no one who looks at the rapid progress which art has been actually making in America since the war can fail to see that the foundations of an American artistic individuality are being already laid, and the names of its pioneers already recorded. For the present the art-students from the great western continent come for their inspiration to England and France, and no doubt they must for some considerable time continue to do so; but just as England has ceased long ago to rely, as it once did, upon the Continent, so may America in due time cease to rely, as it does now, upon Europe. Let us remember, for instance, how the accident (in a certain sense) of the High Church movement brought out in the Gothic revival a wealth of native artistic power which not only was unexpected in other countries, but is still astonishing to true critics amongst ourselves. What is to be the accident in America, and when it is to happen, it is not necessary to speculate upon; if history is to be as history has been the hour will come, and the men. One thing, however, we may at any rate venture to predict:—The new mode of America will not be an effeminate manifestation, but a masculine one.

Enough has been said, we hope, to suggest the value of Professor Kerr's editing. The young student will henceforth be guarded against the errors of the original work, and he will be able to form for himself a more rational notion of architecture as an art and a profession. It is hard to have to expend so much labour in trying to compensate for the wrong done in writing a history without adequate qualifications. There is also a risk that it is labour in vain. So much has to be corrected and qualified, doubts must arise in a reader's mind, and the value of the remainder, or unedited part, is naturally diminished. But if the "History of Modern Architecture" is to be studied, the new edition should alone be used.

There were few temptations before Mr. Fergusson when he was writing the "History of Indian and Eastern Architecture," and hence it is more satisfactory than any of his works which treated of buildings in Europe. It was a great feat to bring into order so much that hitherto seemed chaotic, and the author's reputation is likely to rest upon the volume. Whether his theories of Indian art are all justified remains to be seen, and cannot be determined until the archæological survey is completed and the results discussed. But great credit is due to Mr. Fergusson, and more especially to his publisher, for undertaking so costly a work at a time when the Indian remains were neglected. There is no doubt that through Mr. Fergusson's labours something has been done for the preservation of Indian work, which was too often sacrificed by British officials. Their value in a historical sense has yet to be assessed. We may shut our eyes to their existence, but a history of architecture can only be fragmentary in which their peculiarities are not made plain and brought into relationship with other styles. There may not be much which will bear transference in Indian works, but the account of those which Mr. Fergusson gives in his large volume is like a revelation of a new world, in which building is carried on under conditions that at first sight appear mysterious, but afterwards are found to be as rational as those of the West.

THE VENTILATION OF THE HOUSE OF COMMONS.

THE Select Committee appointed on June 22 to inquire into the ventilation of the House of Commons have prepared their report. The total cost of the suggested alterations is estimated by Mr. John Taylor at 4,735*l.*, the principal items being 2,200*l.* for carrying out the recommendations contained in par. 5, and 1,100*l.* for that contained in par. 7. The recommendations set forth in par. 1 are estimated to cost 250*l.*; par. 2, 250*l.*; par. 3, 200*l.*; par. 4, 10*l.*; par. 6, 300*l.*; par. 8, 100*l.*; par. 9, 300*l.*; and par. 10, 25*l.*

1. The Committee recommend that for the better general ventilation of the House of Commons, including the Debating Chamber, the Committee-rooms, Libraries, Dining, Smoking, Reading, Tea-rooms and corridors, the existing inlets for fresh air drawn from the Terrace be enlarged and altered; and, further, that in order to provide an increased area of intake, the rooms in the basement storey on the river side (eight in number) now in occupation of the Chief Clerk of the House of Lords, and used for the storage of Parliamentary papers, also the adjoining room now in the occupation of the Serjeant-at-Arms of the House of Commons and used as a general store, be made available for the purpose of providing additional air inlets, and that provision for the storage of the present contents of these rooms be made elsewhere.

2. That for the purpose of increasing and improving the supply to the Debating Chamber of air drawn direct from the river front of the building a more powerful air-propeller be provided, and that the existing heating and air-filtering system be rearranged and enlarged.

3. That additional facilities for the admission of air to the Debating Chamber be obtained by making openings beneath the Members' and Ladies' Galleries, so that the incoming air may enter the Chamber through the fretwork at a higher level than at present; while air should also be brought into the Chamber at other suitable points, whereby they believe inconveniences complained of as arising in certain places from draughts may be more effectually prevented.

4. That provision be made for the admission of air at the south end of the "Aye" Division Lobby.

5. That the ventilation of the Committee-rooms be improved by enlarging the existing inlets or by providing additional inlets by means of vertical tubes or perforated flooring, according to the requirements of each room; also that the extraction-shafts, common to all the rooms, be furnished with non-return or back-pressure valves, in order to prevent down-draughts, and that the existing ventilating-furnace arrangements be improved.

6. That the system at present used for ventilating the Committee-room corridor be altered so as to be wholly independent of that of the general ventilation of the Committee-rooms, and that provision be made for the introduction of fresh air beneath the floor of the corridor from the courtyards on the west side, and also for the extraction of the vitiated air through the ceiling and roof of the corridor by means of four upcast or extraction shafts.

7. That double windows be provided for the whole of the Committee-rooms now without them.

8. That means be provided for the admission of air at the inner or eastern wall of the Reading and Tea-rooms, the air to be introduced at a high level instead of as at present from the skirting near the floors of each of these rooms.

9. That the existing water-closets and urinals in the Library corridor be abolished, and that others be provided in the room at the south end of the corridor, now used as a stationery store attached to the Library; the existing doorway to be blocked up, and a more private entrance to be provided.

10. That the ventilation of the serving bar in the Members' Dining-room be improved.

11. The Committee also report that they obtained some evidence on the question of taking the air for the supply of the Houses of Parliament from a high level, rather than as at present from the ground level. The Committee were informed that the former plan was adopted at the opening of the present House of Commons in the year 1851, and was continued in use until the year 1854, when the entire system was reversed, and the Clock and Victoria Towers, which up to that time had been used as down-cast shafts for the admission of fresh air, were altered so as to become up-cast shafts for the extraction of vitiated air from all parts of the building. No specific reason for the change is recorded in the reports of the committees of both Houses by whom the subject was considered, but it appears to have been thought that an improvement in the ventilation of the House of Commons had been effected by the reversal of the system, and a similar course was followed in the House of Lords, apparently after mature consideration.

12. The Committee also took evidence as to the system of drainage of the Houses of Parliament, which was established in pursuance of the report of the Select Committee on the Ventilation of the House in 1886, and they find that the system

works satisfactorily. The Committee are satisfied that the connection between the Houses of Parliament sewer and the metropolitan main sewer is so constructed that no backwater or return of sewage or of sewer-gases from the metropolitan sewer can enter those of the Houses of Parliament; and the Committee are convinced that no offensive smells or injurious emanations now proceed from the drainage system of the Houses of Parliament, which they are of opinion is as perfect as possible.

13. The Committee have also ascertained that steps were taken to approach the Metropolitan Board of Works with a view of obtaining some improvements in the drainage of that part of Westminster lying immediately outside the Houses of Parliament, and that among other remedial measures an attempt was made to ventilate that portion of the low-level sewer which runs close by the Clock Tower, by connecting it with an extraction shaft or outlet of low elevation situated at the termination of the parapet of the Victoria Embankment, where it joins Westminster Bridge; this ventilator, the Committee have ascertained, was, very shortly after its erection, stopped up owing to the complaints of foul smells which pervaded the immediate neighbourhood. The Committee recommend that communication be made to the London County Council requesting that body to consider the desirability of improving the ventilation of their main sewers in the neighbourhood of the Houses of Parliament, especially by the erection of suitable shafts and furnaces in convenient positions to create powerful exhausts, so that the gratings at the ground-level may become inlets for air to the system, instead of as at present outlets for gases from the sewers; the Committee, however, cannot approve of a suggestion made to them that a ventilating shaft should be introduced into and carried to the top of the upcast shaft in the Clock Tower for that purpose.

ST. MATTHEW, WESTMINSTER.

AN application was presented in the Consistory Court of London on Monday by the Rev. W. B. Trevelyan, vicar of St. Matthew, Westminster, and the churchwarden, Mr. Hubert Poole, for a faculty to carry out certain alterations in the church. The petition set forth that it was desired to cut away part of the buttress on the south side of the chancel, and to form archways through the buttresses on the east and north sides of the chancel, in order to make a passage to a room outside the vestry; to erect a new vestry with a chapel over it; and to place a holy table in the chapel for occasional use, the passage thus made connecting the old vestry with the new vestry.

The Rev. W. B. Trevelyan, the vicar, moved for the faculty, and in the course of his evidence said that the church was in Great Peter Street. It had no churchyard, but stood in a small piece of enclosed ground. It was built in 1854, and no burials had taken place in it. A clergy-house had been erected on ground which was to be vested in trustees, and which adjoined the ground surrounding the church. That was on the south side. On the other side of the chancel he wanted to build a vestry and to make an entrance from the south aisle into a chapel which was to be erected above the vestry. The chapel would be entirely separate from the chancel, and there would be steps leading into the west end of the chapel. There would also be another entrance from the clergy house. The vestry would be built on part of the ground which surrounded the church, and the chapel would be placed over it. The chapel would be used generally for private services, and occasionally for early services and communion. The population of the parish was between 8,000 and 9,000. The ground had not been consecrated, but the church had. The cost of the proposed alterations would be about 1,000*l.*, and the money would be forthcoming. The Charity Commissioners were aware of what was proposed, and had raised no objection.

Mr. H. Poole having concurred in the application, the Chancellor said that the Court was prepared to grant the faculty. It would, however, be necessary, as the chapel was entirely distinct from the church, and was to be used on occasions when it was inconvenient to use the church, and as it was intended to place a holy table in it, that the chapel should be consecrated. As there seemed to be no difficulty about that, and as there was no objection on the part of the Charity Comissioners, he would grant the faculty as prayed.

ST. HELEN'S CHURCH, BISHOPSGATE.

ON Monday an application was made by the rector of the united parishes of St. Helen's, Bishopsgate, and St. Martin Outwich, and the churchwardens, for a faculty to carry out certain restorations of their church on plans submitted by Mr. J. L. Pearson, R.A.

According to the petition these plans included the erection of new vestries, the lowering of floors, the repaving of the church, altering the position of the pulpit, the reglazing of windows, and the addition of three windows. The estimated cost was 7,000*l.*, of which the Charity Commissioners were prepared to advance 4,092*l.*

The Rev. J. A. L. Airey, the rector, moved for the faculty as prayed. He said that the Merchant Taylors' Company, the patrons of the living, proposed to give 2,000*l.* in addition to the 4,092*l.* authorised by the Charity Commissioners towards the restoration. There were two chapels now in existence in the church. There was no screen between them, and he did not propose to erect one. There was a communion-table in one of the chapels, which was the old original slab forming the *mensa* of the lady chapel. It was now lying on the floor, and it was proposed to put it on pedestals, and to use it for celebrations at which small numbers of people were present, and for week-day services. In lowering portions of the floor it would be necessary to lower some of the tombs, though they would still remain on their original site. There was one tomb, that of Sir Francis Bancroft, which it was desired to place in the crypt, as it was a great disfigurement to the church.

The Chancellor (Dr. Tristram) said he should like to know what tombs were to be moved. He would inspect the church before the faculty was issued, and would see what tombs they proposed to move, so that there might be in the faculty a special proviso with regard to consent.

Mr. John Codd, manager to Mr. J. L. Pearson, R.A., Mr. T. Rolfe and Mr. E. G. Cherry, churchwardens, having expressed their concurrence,

The Chancellor said that, with regard to the slab, it would be safer to place it on wooden pediments than to use stone for the purpose, as that would keep it within the decision that had been given by the Judicial Committee of the Privy Council. The Court would grant the faculty as prayed, subject to certain provisoes and certain consents. Before the faculty was issued he would inspect the church, so that he might be able to direct what proviso should be inserted. There must be included in the faculty a power to close the church during the restoration, as well as a provision for the publication of banns of marriage, and for certain other matters in an adjoining parish.

CORRESPONDENCE

Westminster Abbey Enlargement.

SIR,—One of the reasons given for its adoption by those members of the Royal Commission who are in favour of the refectory site is so opposed to the principle on which the old monks or freemasons would have worked, that I beg to send you in proof thereof a brief description of the refectory at St. Mary's Abbey, Jorvaux, about two miles from Middleham in Yorkshire.

At Rievaulx the church itself is the conspicuous object. Here at Jorvaux the majestic refectory and domestic buildings stand out in massive grandeur against the surrounding woods. The plan of the church is cruciform, with aisles to a nave of ten bays, and with a choir of four bays; a transept of three bays with east aisle, and a lady-chapel. The cloister court is on the south-west of the nave. In line with the west front is the ambulatory with dormitory above; on the east side is the oblong chapter-house, the kitchen and abbot's lodge; to the south was the noble refectory of seven bays and two aisles.

Sir Walter Scott represents Harold the Dauntless as a pillager of one of the brotherhood:

> Then heeding full little of ban or of curse,
> He has seized the Prior of Jorvaux's purse.

The exquisite chapter-house retains its corbels with colours on them. The kitchen exhibits three enormous fireplaces 9 feet wide. The chapter-house had a central arcade with six hexagonal pillars of grey marble. The last abbot, John de Sedburgh, was hanged at Tyburn for his share in the rising of the north.

I observe that a discussion is going on in the columns of the *Times* as to the relative advantages of two sites for the intended enlargement of our Abbey. The refectory at Jorvaux is in exactly the same position in relation to the Abbey itself as the refectory is (or rather was) at Westminster, but the above particulars show that in the old times it was not thought desirable to build something insignificant (even for a refectory), which "we should not see at all until we were beneath its vaulting." I have no hesitation in saying that we shall be more likely to restore the outward appearance of the Abbey and the ancient plan of the monastery by building nobly rather than timidly, whatever site may eventually be fixed upon.

BENEDICTUS.

NEW TRAVELLERS' CLUB.

THIS building, situated at the corner of Piccadilly and White Horse Street, is now being erected for the above club by Sir HENRY BROWNRIGG, Bart. The accommodation provided consists of morning, smoking and dining-rooms, cloak and service-rooms on the ground floor, reading, writing and card-rooms, private dining and billiard-rooms on the first floor. On the upper floors are the secretary's rooms and bedrooms for the convenience of members. In the two basements are the lavatories and retiring-rooms for the members and staff, kitchen, cellars, stores, offices and boiler-rooms, &c. The front is executed in Ham Hill stone, and the building is entirely of fireproof construction on Messrs. DENNETT & INGLE'S system; the warming and ventilation is being carried out by Mr. W. W. PHIPSON, and the sanitary work by Messrs. JOHN BOLDING & SON. The contractors are Messrs. A. BUSH & SONS. Messrs. T. & F. VERITY are the architects.

MESSRS. YOUNG & MARTEN'S PREMISES, BROADWAY, STRATFORD, E.

THIS drawing represents the premises of Messrs. YOUNG & MARTEN, in the Broadway, Stratford, E., as recently altered and enlarged. There is now a handsome new central entrance, having a staircase with two branches leading up to the gasfittings and paper departments on the one side, and to the chimneypiece and stove departments on the other. In the rear extensive warehouses have been built, which are fitted with hydraulic lifts and trams, so that the heaviest goods can be easily brought into the show-rooms. Steam power is also provided for driving the lathes and forges as well as the dynamos for the electric light. The works have been carried out from the designs and under the superintendence of Mr. ARTHUR ASHBRIDGE, F.R.I.B.A.

WESTMINSTER ABBEY.

IN the report of the Commission on Westminster Abbey it was stated that Sir A. H. Layard, Sir F. Leighton and the Dean of Westminster differed from the other Commissioners. The subject has given rise to the following correspondence in the *Times*:—

Sir A. H. Layard writes:—It appears to me to be of some importance that the public should be informed of the nature of the objections of Sir Frederick Leighton, the Dean of Westminster and myself to the refectory site for the monumental or mortuary chapel proposed to be added to Westminster Abbey, as we had no opportunity of stating them in the final report of the Royal Commission, of which we were members. I venture, therefore, to ask you to allow them to appear in your columns. The grounds of our dissent from our colleagues, Mr. Plunket, Mr. Jennings and Mr. Waterhouse, are the following:—

1. The proposed addition to the Abbey should be, as far as possible, a part and continuation of the Abbey itself, and should be capable of acquiring, in the future, a similar prestige and sanctity. These conditions would not, in our opinion, be fulfilled by the erection of the chapel on the refectory site, which is separated from the Abbey by the cloisters—a much-frequented public thoroughfare. On this objection the Archbishop of Canterbury, in his weighty evidence, laid great stress. As the Dean of Westminster stated to the Commission that the remains of the refectory afforded almost the only spot available for an office for the clerk of the works and for storing fragments of the old masonry (often very valuable), timber, lead and other materials, a chapel erected on the site would run a grave risk of becoming a lumber-room, especially as the cloisters are open to the general public, and the chapel would consequently have to be usually closed. The refectory site, from the very different associations which its name and ancient use—that of the monks' dining-room—suggest, would increase the difficulty of investing any new building raised on it with the associations and sacredness of the Abbey itself.

2. It is proposed, if the refectory site be adopted, to retain as the northern, and part of the eastern, wall of the chapel the existing wall, part of which dates from the period of Edward the Confessor, and the remainder from that of Edward IV. The rest of the building would be entirely new, and there would thus be an extraordinary and by no means pleasing contrast between the two portions of the interior. The old wall would not be available for monuments unless largely restored, or, indeed, partly reconstructed. Any such measure would provoke very keen opposition from all persons interested in the preservation of ancient buildings, and especially from influential archæologists.

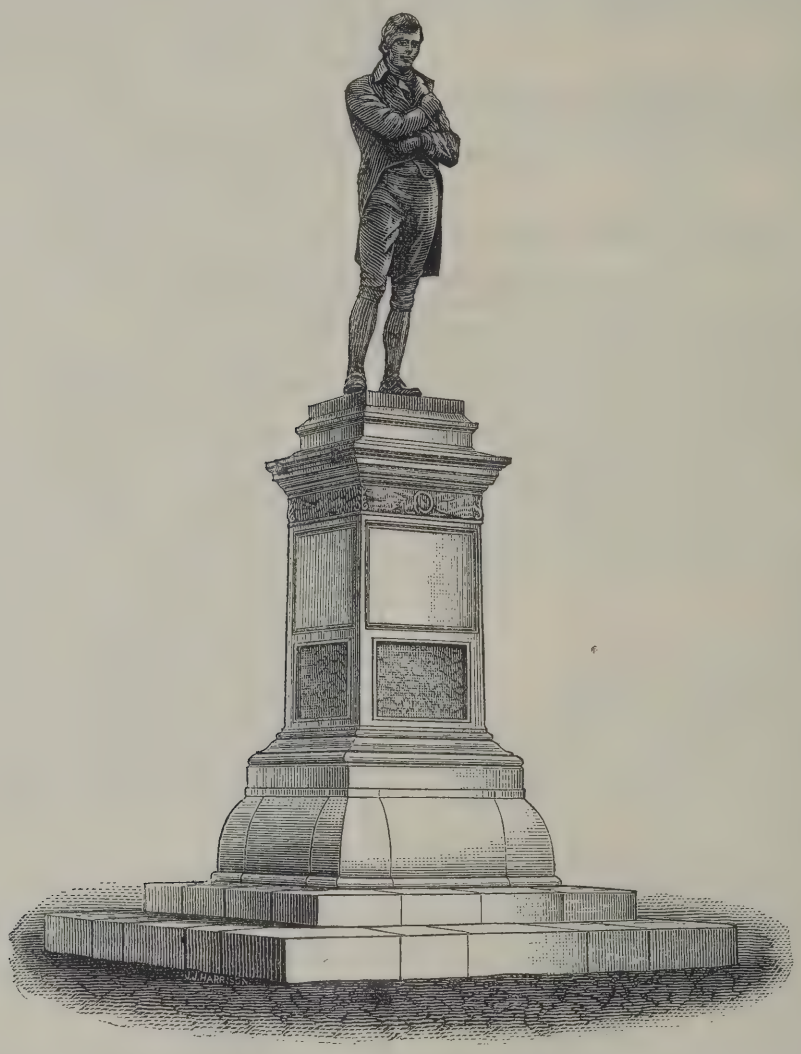
3. That part of the refectory site now available would be inadequate for the erection of a monumental chapel worthy of the Abbey. It would be absolutely necessary to reacquire, even for the erection of a building of moderate size, the portion of it made over by Act of Parliament some years ago to the governing body of Westminster School, who, we are informed, would strenuously oppose any such retransfer. Moreover, a building erected on this site would seriously interfere with the lights of Ashburnham House, their property. Even with the addition of the alienated portion, a chapel worthy of the object intended, and of a size sufficient for the reception of monuments for any long period of time, could not be erected upon the refectory site, and the question of want of space would again arise. The proposed structure would only be about 130 feet in length by 37 feet in breadth, and it is very doubtful whether any means could be found for enlarging it. The north side of it, as already stated, would not be available for monuments if the ancient character of the wall forming it is to be preserved, and the opposite side would be encumbered by architectural details—as shown in Mr. Pearson's design (No. 12) annexed to the first report of the Royal Commission.

4. The plea urged in favour of a chapel on the refectory site—that it would "be hardly, if at all, visible from the outside"—appeared to us to be rather a blemish and disqualification in regard to a structure which, to have any significance, must, to future generations, share in the dignity of the great Abbey itself.

For these and other reasons we believe that interment in a chapel on the refectory site could never come to be considered as "burial in Westminster Abbey," and this, in our opinion, is an objection fatal to the scheme. On the other hand, on the site at the east end of the Abbey, which was preferred by Sir Frederick Leighton, the Dean of Westminster and myself, an edifice might be raised which would be in direct communication with the Abbey and would actually be part of it as its east end entrance—an edifice which would admit of further extension and could be erected in sections, and which might form, with the Abbey itself and the chapter-house, an imposing and beautiful group of buildings. It is to be regretted that the important evidence given on this subject by Mr. Pearson at the last meeting of the Commission was not added to its report. That eminent architect submitted to the Commission a very elaborate and most carefully-prepared design for this proposed addition to the Abbey, which enables us to state with some confidence—without, however, committing ourselves to any opinion as to its architectural features and details—that a structure which by its dignity and stateliness would perpetuate the solemn traditions attaching to the Abbey itself might be erected on this site, and that interment in it would be considered "burial in Westminster Abbey."

In conclusion, I may advert to an excellent suggestion made by the Dean of Westminster with the object of preserving the ancient wall of the refectory, that it might form part of a modest structure to serve as an office for the clerk of the works, and as a kind of museum to preserve relics of great interest and importance in their bearing upon the Abbey which are constantly accumulating.

Mr. Waterhouse writes:—Sir Henry Layard has stated in his letter to the *Times* of the 16th inst. the reasons which induced him, Sir F. Leighton, and the Dean of Westminster to dissent from the final recommendation of the report, that the proposed mortuary chapel should occupy the site of the old refectory of the monastery. Would you allow me a short space to explain some of the reasons which prevented me, as a member of the Commission, from joining these distinguished authorities in their dissent?



In the first place, though Mr. Pearson, the architect to the Chapter, produced at the close of the meeting of the Commission a very meritorious design for the proposed building on the site south of Henry VII.'s Chapel, it could only be approached from the Abbey by a cloister threading its way, necessarily somewhat awkwardly, through the arches formed by the flying buttresses of the chapter-house, and thus shutting out for ever from view the lower portions of that most beautiful feature of the Abbey group, just where the condemnation, and, as we hope, speedy removal, of the houses which now screen it from Old Palace Yard would restore to public appreciation a piece of splendid architecture, which has for so many generations been too much concealed.

In the second place, and on the other hand, the way to the refectory site from the Abbey is already made. It is one of the most noble and most beautiful that can be conceived—a way hallowed by association with the past—the west walk of the

cloisters. It has been urged against traversing the cloisters to gain the chapel that tradesmen take that way to the residences of the clergy east of the cloisters. This, it appears to me, could be prevented by requiring tradesmen to take another route. But the argument further loses force when we remember that it is the south walk they frequent, and not the west, which appears to lead only to the nave of the Abbey, and which is the entrance actually and at present for all funerals but royal ones.

Mr. Pearson's design, alluded to by Sir H. Layard, for covering the refectory site with a chapel was, again, one of great excellence. It covered an area nearly, if not quite, as large as the unobstructed portion of the nave of the Abbey, and of about the same proportions, and would surely supply the nation's needs for centuries, with the care now exercised to allow none but the greatest finding sepulture or monumental fame within the Abbey precincts. It is true that monks once dined on the refectory site; so have people dined, and, possibly in times long passed, even done worse than dine, in the houses which now occupy the south-east site. I do not think, therefore, that in point of association one site has much advantage over the other. On the refectory site we should have a beautiful structure which would not alter the present outward appearance of the Abbey nor the ancient plan of the monastery in the slightest, which we should not see at all (except perhaps its roof over the cloisters) until we were beneath its vaulting, and which would have a pathway of quite ideal excellence connecting it directly with the Abbey itself. On the south-east site we should have, if Mr. Pearson's design for that site was adopted, and when it was fully developed, a building we might well be proud of, but which would add a new feature to the interior of the Abbey, would be a serious competitor with Henry VII.'s Chapel itself, and be approached by a cloister from the necessities of the case somewhat unworthy of it—a cloister, moreover, which would confuse itself with, and hide the lower portions of, the noble chapter-house. Both schemes, it seems to me, have their merits, or the Commissioners would probably have been able to come to a unanimous recommendation. It is to be hoped that this want of unanimity will not prevent one or other of them being speedily adopted.

Mr. C. L. Eastlake writes:—A distinguished architect and member of the Commission on Westminster Abbey has lately given you his reasons for advocating the erection of a chapel, destined to receive monuments, on the site of the old refectory. Assuming the right of building there at all to have been acquired, I hope your correspondent will forgive me for reminding him of the old maxim, "Ædificare in tuo proprio solo non licet quod alteri noceat." Apart from the question of space available (and I doubt very much whether the area indicated would be sufficient, or nearly sufficient, for its purpose), there is another practical difficulty in the way, viz. Ashburnham House. At present the refectory site is really included in what once was, and still ought to be, a garden at the rear of this fine old mansion—a specimen of seventeenth-century architecture well known and dear to antiquaries, illustrated by Soane and Gwilt, lauded by Britton and Pugin, and possessing a staircase of such exceptional beauty that its design has been ascribed, not unreasonably, to Inigo Jones. This building is now the property of Westminster School, and, as the Head Master recently explained, has been turned to excellent account, without any material alteration of its features, by an appropriation of its several apartments to the purposes of a library and reading-room for the boys, classrooms, masters' common room, &c., all greatly needed, as I well remember, for when I was an *alumnus* at Westminster such accommodation did not exist. Now, if the refectory site be devoted to the erection of a chapel, the present open area which contributes so much to the light and ventilation of Ashburnham House will disappear. Its rear windows will be darkened by the proposed new structure, and many of its rooms must in consequence be rendered useless. Indeed, I fear the next step would be a proposal to demolish Ashburnham House itself. Is it necessary or desirable to encounter such a risk? I do not presume, sir, to offer an opinion respecting the alternative schemes submitted to the Commission, but one of them at least, as Sir Henry Layard, in his able letter to the *Times* of the 16th inst., pointed out, would meet every requirement, without involving the disfigurement and possibly the destruction of an old and highly-interesting building.

BURNS'S STATUE AT AYR.

THE above engraving shows the statue of Burns as unveiled at Ayr on the 8th inst. The statue is heroic in scale, standing 9 feet 1½ inches high, and is from the studio of Mr. George A. Lawson, H.R.S.A., of London. The pedestal is from the designs of Messrs. James A. Morris & Hunter, architects, of Ayr, and is executed in selected Kemnay granite by

Mr. Arthur Taylor, of Aberdeen. It is about 12 feet 3 inches high and has a 12 feet spread of base. The statue is regarded as the most successful of Burns yet produced, and being erected in his native town is of the greatest public interest.

PERSIAN CARPET WEAVING.*

CARPETS are manufactured in many parts of Persia; Isfahan, Shiraz and Kerman have all a certain fame for carpets; and, similarly, Kermanshah, Yezd, Kashan and Shuster are known for their cotton khelims. The most important manufacture of carpets, however, is in North-West Persia, in sundry provinces, with Sultanabad in Irak as the principal centre. Sultanabad is a comparatively new town, having been built, perhaps, sixty to eighty years ago. In the numerous villages by which it is surrounded, carpet weaving has been the great branch of industry for generations past, although in late years considerable improvements have been made in the class of work produced.

Of the valuable ancient carpets relatively few are found nowadays; like curios, the country is pretty well exhausted of them. Persia has been visited by so many European travellers in recent years that its formerly hidden treasures in the shape of curiosities, &c., have been hunted up out of their corners and have found their way to European museums or private collections.

It may seem almost incredible to many people that among the ancient carpets, whose manufacture dates back for such a considerable number of years, there are so many to be found that are still in good condition and comparatively little worn. The secret of this is that not only has great care been bestowed on the weaving of the carpets and on the quality of wool used, but because of the custom prevailing in the houses of Eastern people. Whilst we, with our more civilised ideas, enter our own and other people's rooms with the same boots with which we walk through the muddy streets, a Persian never enters any room, either his own or his neighbour's, without leaving his boots or shoes at the door. The Persian carpets of modern times are now so well known in Europe that a more detailed description as to the way in which they are manufactured may prove interesting.

The weaving is done exclusively by women of all ages. The only share the men take in the work is, that to them the merchants give out the designs (*wagirehs*), the colours, and money required for the weaving. The men also see to the purchase of the wool, &c., and afterwards deliver the carpets to the merchants, getting all the blame for mistakes made in the weaving by their respective wives and daughters. A loom itself is a very inexpensive and simple structure, consisting of four wooden poles, which generally occupy the whole length of the weaving-room. The first thing a weaver has to do when he starts weaving is to buy the necessary material for mounting his carpet and for the warp, the mounting being also a duty allotted to the men. Then he buys his wool and sends it to the dyer, to have it dyed according to the samples given out to him by the merchant. It must not be thought, however, that a weaver, as soon as he has obtained an order for a carpet, hurries home to his village to start it the next morning. There certainly are quick weavers, but they are few and far between. A great many, as soon as they have received the cash advanced to them, spend a greater or smaller part of it on themselves. They buy themselves clothing, pay off debts, gamble, or invest in land, gardens, grain, &c. By the time the carpet ought to be ready the weaver frequently only begins to think of starting it. His speculations often turn out badly, and he finds himself consequently unable to finish the carpet contracted for with the money he has left. However, he buys a little wool to start with, and has it dyed, a quantity sufficient perhaps for one-third of the carpet he has to weave. When this is finished, his resources are probably exhausted, and he is therefore obliged to look out for other means to complete the carpet. His next move is to try and obtain an order for a second carpet from another merchant—of course solemnly declaring that he has no contract for a carpet for anybody else, and promising to deliver it within the stipulated time. He is always, according to his own words, the very best and quickest weaver of his village, and has plenty of reasons to show for happening to be without work just then. Most frequently his excuse for having left his former master is that, owing to a serious (but generally imaginary) illness of his wife, his last carpet was one month overdue, for which interest had been deducted, and he therefore does not wish to serve that master any more. His village being perhaps twenty to thirty miles away, the truth of such statements cannot be determined at once.

Instead of applying to a second master, he also frequently goes to the one for whom he is weaving, and tells him that his carpet is almost finished, that it will be delivered during the next week, &c., but that, as he wants some money for himself, he would be glad of a small advance on account of his next contract. Supplied with fresh money, he then finishes the original carpet. First, however, he must buy the remainder of the wool required and send it to the dyer. The latter is in most cases quite as careless as the weaver, and never dyes the same shade of colour twice, the hue being either darker or lighter. The result is that the wool with which the first part of the carpet is woven is of a different shade from the second part, but this can no more be helped, and the carpet is delivered as it turns out, viz. spoiled. This, however, is not the only consequence of the weaver's private speculations. He has to make up for his loss somehow or other, and accordingly buys an inferior kind of wool than that contracted for, gets other and cheaper colours dyed than his samples, and employs less experienced weavers, so as to save something in wages. With his next carpet he deals very much in the same way, and the only means of punishing him is to dismiss him, and to make him pay for the difference in value between the carpet delivered and that contracted for. If he does the latter he has of course to cheat somebody else first.

Even if we take the case of a good weaver his work seldom progresses without incessant interruptions. Often the dyer disappoints him by keeping him waiting for his wool, but more frequently his own household affairs put a temporary stop to weaving. His wife has to attend to her baby, milk the cows, make butter, see to the sheep, &c., all of which cause constant delays in the progress of the work.

When weaving is going on regularly, three or four women at a carpet of fairly large size, the weaver's wife being, as a rule, the principal weaver, and at the same time superintending the work of her daughters or hired women, the rule is that at each end of the board on which the women are seated there should be one female overseer. For carpets of very large size, in the weaving of which seven or eight women are employed, there is also one overseer in the middle. At the age of seven years girls begin already to assist in the weaving; previous to that age they spend a year or so on the board, watching the other women, so that at an early age they may be accustomed to the work. If a young woman who has been brought up to the loom gets married, the first thing she does is to try and obtain an order for a carpet, so that the weaving of carpets passes down from one generation to another.

People in Europe who buy Persian carpets little think of the enormous labour that has been expended on the weaving. It is done exclusively by hand, and every stitch in the carpet is made separately, being afterwards clipped with the scissors and beaten down. Some idea of the work may be formed when it is known that in a good carpet there are about 10,000 stitches to every square foot.

The clipping and beating down are also very essential points in the work. The clipping, for instance, must be done every time with equal care, otherwise, when the carpet is finished, the pile will be short in some places and longer in others. Upon the beating down depends the closeness of the texture; the more a weaver beats her stitches down the finer, of course, the carpet is. She knows how many stitches she has to weave to every quarter of a Persian yard, but she generally makes less, so as to save wool, time and trouble. There are carpets, like the cheap Heratis, which have no more than 50 stitches, and 75 stitches, at the highest, to every quarter Persian *zar*. Good quality carpets have 85 to 95 stitches, and finely-woven rugs have frequently over 200 stitches. At the latter rate there would be fully 40,000 stitches to a square foot.

In summer time, when the days are long, the work goes on fairly fast; but in winter it progresses very slowly. When the cold is not too intense, the women have a pot with fire between them when weaving, over which they warm their fingers from time to time, but on very cold days they suspend work altogether.

The width of a carpet depends upon the size of the loom, but the length can be made of any dimension. When the weaving has all but reached to the top of the loom, the carpet has to be taken down and rolled up at the bottom, and the work is then started again upwards. The rolled up (finished) part is sewn to the bottom part of the loom, and if this is not done very carefully the remaining portion of the carpet is sure to "go out"—in other words, the carpet turns out crooked.

There are several European firms engaged in the trade, whose headquarters are in Manchester and London. Besides these European houses, a great number of Persian and Turkish merchants export carpets. When the trade was exclusively in the hands of native merchants, no other carpets were woven than the ordinary Herati and Shah-Abbas kinds. By introducing new designs, great improvements have been made in this direction by the European firms. These designs, which have been made at great expense and have cost much labour, are their individual property. Weavers have now grown pretty well accustomed to weaving these new designs, but they frequently

* From a report by M. G. de Vries in the *Journal of the Society of Arts*.

spoil the effect of them by leaving out part of the original design, and placing something of their own invention in its stead. Even nowadays, nearly all the carpets exported by Persians and Turks are Heratis and Shah-Abbas patterns, with a few very simple designs among them. They do not understand the art of designing something novel, but are very clever in the art of pirating the designs belonging to the European firms. Formerly there did not exist any law against this pirating of designs, but as in recent years this evil grew worse and worse, the Persian Government, through the influence of the British Legation at Teheran, have at last, at the commencement of this year, acknowledged the right of property of designs, and the copying of them is now strictly prohibited.

In addition to designs, the shades of colours employed in the carpets are a matter of vital importance, requiring the most careful attention, since they must be in harmony with the ever-changing taste of European markets. At present entirely new colours are the rage, which give a carpet more the appearance of an antique than of a new one; but it is certain that the taste for these fancy colours is only a passing one, and the sooner people return to the former colours the better. Aniline is still greatly used in the dyes by the native merchants, but carpets woven of such colours should be entirely avoided, as the colours fade away after a time. Besides woollen carpets, rugs are exported woven entirely of silk. The weaving of such rugs is done in the same way as the weaving of carpets, but the labour is far greater in proportion, as they are always of a very fine make. Such rugs can be used as table and sofa-covers, portières, &c., but as they are made of pure silk they are very costly.

Altogether, it will be seen from the foregoing that the Persian carpet business is far from being a bed of roses. From all points of view the trade is a most difficult one, and long experience and a thorough acquaintance with the weavers and their ways are necessary to surmount some of the numerous obstacles.

The districts where carpets are woven are Ferahan, Muscabad, Japelag, Kezaz, Cherreh and Saraband, comprising in all about 150 villages, with a total number of looms estimated at about 5,000. The quality of carpets which these looms produce varies according to the districts. Most of the above districts produce only second and third quality work. In two of the largest, however, a fair proportion of the looms produce first quality carpets.

In some of the looms as many as five to six hands are employed, but this is rather an exception. The average is three weavers to a loom of fairly large size, one or two weavers for small looms; so that, if all looms are engaged, close upon 1,000 hands would be employed. A fast and steady weaver could deliver annually three to four carpets of ordinary size; but a large number only weave at intervals, and slow weavers take sometimes eighteen months to two years to finish one carpet. The irregular weaving makes it, therefore, impossible to give anything like a reliable estimate of the annual output or export value.

ANCIENT LINCOLN.

A SPECIAL meeting of the Lincoln Town Council was lately held in the Guildhall, for the purpose of presenting a congratulatory address to the high sheriff of the county, Mr. Jos. Ruston, J.P., and also for the purpose of conferring upon him the honorary freedom of the city. In acknowledging the honour conferred on him, Mr. Ruston alluded to the antiquity of Lincoln. Lincoln, he said, is not what we may call a mushroom borough. We know there are cities and large towns in Great Britain now with half a million people, about which one can only use an expression of that kind when we want to compare those places with the antiquity of this city of Lincoln, and I feel, when we look upon the records of this city in connection with its antiquity, I have every reason to be proud of it, and these words are to me immensely enhanced, and this gift is immensely enhanced by the remembrance of those things. Many hundreds of years ago—more than a thousand years ago—this city was spoken of as a splendid city, with more than a thousand mansions in it, and everywhere we see around us the ruins of noble buildings, and we know that beneath our feet there lie the remains of other noble buildings and noble work, all of which speak to us of the greatness of the men who lived in those days. I need only refer you for one moment to those columns which were discovered by Mr. Allis, in Bailgate, about twelve years ago—two or three columns which indicated there was an important Roman structure there. That discovery was increased by another discovery upon adjoining property, when the line of these columns was more than doubled, and now within the last four months another discovery on the very same site was made by the workmen of your municipality in connection, I believe, with your waterworks, when they laid bare a line of columns, showing that there must have been a building as long as the nave of Lincoln Cathedral. When we reflect that that building went back to a period of 1,400 or 1,800 years ago, I am sure we have something to be proud of when we remember the men who lived in this city so long ago. Why, we sent members to Parliament more than 600 years ago, and I believe the first Mayor that filled that chair, although it was not in this building, was elected in 1384, so that the freedom of this city, which you have been gracious and kind enough to present to me to-day a a mark of your esteem, is not that of a borough or city which has been created within the last hundred years, but it comes from a city which is one of the oldest—one of the two or three oldest—in Great Britain. When I think of these things I am proud to belong to this city of Lincoln. I find it is full of great and noble traditions on account of these great men of old who have preceded us. They have in their works left their mark for us to study and to guide us. I have spoken of that Roman forum or basilica, or villa, whatever it was, and we know during the last hundred years we find treasured in this place or that place different specimens of art-work or useful work in stone which was carried out by those ancestors of ours so many hundreds, almost thousands, of years ago; and then, again, look at the more modern work, the cathedral upon the hill of this city. I like to ask myself—who was the designer of that building, and who were the artificers who carried out the work? Then look at this county as a whole. It has reared great men in statesmanship, in science, art and literature. We have had men who have become eminent in adventures, in travel, in discoveries, in agriculture and in commerce, and whence have come all these modern men, comparatively modern men as compared with the antiquity of Roman times? I speak of such men as Isaac Newton and Lord Burghley and others of three centuries past. I speak of them as modern men, and I delight to find some reason for their existence in connection with the great ancestors who preceded them. I like to feel that I may get some reasonable account of the fact that this county has raised such great men, and that in that respect the mantle of these ancestors has fallen upon the shoulders of their successors; and I believe as we cherish these traditions they will inspire higher ideals and nobler aims in life—the memory of our fathers is enshrined in the works which they have left us, and which we see around us.

TESSERÆ.

Effects of Shadow on Colours.

IT is not surprising that the effect of shadow upon colours should be generally unobserved. When recognised at all, it is commonly supposed simply to darken colour; but this is a loose notion—it really expunges colour. The proper colour of an illuminated object disappears where shadow comes upon it, and not only so, but another appears in its stead, the opposite of that displaced. If the illuminated colour is warm the shadow will be cool, varying from gray to positive blue or purple, and even crimson, which is on the cold side compared with orange and rich green. If the illuminated surface is cool, as in moonlight, the shadows will be warm and brown. Shadows among colours introduce a delicious tenderness and variety of neutral tones, but other influences combine for this, the most potent of which are the reflections which invade shadows. These carry with them the tints of the surface from which they come; hence the blueness of many shadows which receive the reflected light of the sky, and the warmth of a shadowed wall against which the ground tints strike. But other than shadowed spaces are thus affected. Observe the sea receiving on its bosom all the hues of the sky, or the still lake returning those of its shores, or the pool enriched with the colours of its shelving banks and overhanging trees. Such reflections are exquisite in their translucent play. But all things in the glow of daylight return each other's colours wherever their relative positions admit of it, so that colour is broken and spread by this means over almost the entire surface of nature, and by reason of its dim and fitful character, bordering upon mystery, possesses a secret hold upon the imagination. Transparency imparts a peculiarly pure brilliance—not gay, but soft. All coarseness or dulness vanishes, and the colours are penetrated with a hidden radiance which delights the fancy. Leaves are enriched to emeralds, water emulates the trembling splendour of amethyst and topaz, clouds become mother-of-pearl. Yet art must be chary of these beauties, as nature is. Opacity has its satisfaction; the grainy solid masses, the dull and mingled glooms, feast the eye as with substantial wealth. But atmosphere is the most universal and effective agent in modifying colour. Atmosphere gradates colours, but it also changes them. The green near woods become a tender blue in the distance, neutral-tinted rocks a pale crimson, and the brown moorland or dark fir-wood a rich purple. These general facts are noticed by most of those whose rambles lead them into open country. But few observe how the green of a field fades as it recedes; a green field is to

the ordinary eye green all over. The artist notices the varying quality of the green, that when the atmosphere is suffused with sunlight the nearer green is a golden yellow, the distant almost blue.

Melrose Abbey.

The most beautiful of all the northern fanes of whatever time is Melrose. The splendour of Middle Age romance which Scott has thrown around the place has almost obliterated its older and holier renown, when it was described by Bede as the home of the meek Eata, the prophetic Boisil, the austere Cuthbert; when, with Coldingham and Abercorn and Tyningham, it was the lamp of that Anglo-Saxon Lothian which, deriving its own faith from Iona, sped the glad gift to many an English province, and even sent a missionary across the seas to become the apostle of the Austrasian tribes on the Meuse, the Waal and the Rhine. The light of Melrose had long been quenched, when in the middle of the twelfth century St. David bestowed the territory on a colony of white-robed Cistercians from Rievaulx. The site of the ancient shrine, on a lovely bank almost encircled by the Tweed, was still marked by a chapel, which bore the name of St. Cuthbert, and was the frequent resort of pilgrims. But the new monks chose their dwelling some little distance above, on the plain between the river and the skirts of "Eildon's triple height." They dug the foundations of their church in the spring of 1136, and it was consecrated before the summer of 1146 was at an end. This fabric was laid in ruins during the Wars of the Succession—the scourge of which fell so heavy on the border abbeys that the monks and novices of wealthy Kelso, though their house escaped destruction, were driven to beg food and clothing among the more fortunate monasteries remote from the English march. The rebuilding of Melrose, as we now see it, received the especial patronage of Bruce, and occupied almost his latest thoughts. In 1326 he made a grant to the monastery, for the fabric of its new church, of all the feudal casualties and crown issues of Teviotdale, until they should amount to two thousand pounds sterling—a sum equal to more than fifty thousand pounds in the present day. "The good Sir James of Douglas" was appointed steward and warden of the bequest; and the king, from his deathbed at Cardross on the Clyde, addressed a letter to his son and successor, entreating him in the tenderest terms, and by the most solemn adjurations, to see that the grant received liberal fulfilment, and that "all love, honour and privilege be rendered for evermore to the monastery of Melrose, which he himself had in such pious affection, that he had appointed his heart to be buried within its walls." This remarkable letter was written on May 11, and the king expired on June 7, 1329, so that it must have been suddenly and in the last stages of his loathsome malady that the innocent blood of Cumyn and the unfulfilled vow of penance rose before his soul, and he resolved that his dead heart should be borne by the Knight of Douglas on that pilgrimage to the Holy Land which his living feet had failed to accomplish. But the memorable death of the good Sir James frustrated the king's dying wish; and the heart, brought back from the Andalusian battlefield, was by Randolph entombed at Melrose "with great worship." The new building seems for a time to have proceeded slowly. The grant of King Robert was renewed by David II. in 1370, in terms which show that no considerable portion of the two thousand pounds had then been received; and, indeed, it appears that the full amount of the bequest had not been completed even in 1399. Great part of the edifice, however, must have been built before that time, by the help doubtless of the opulent revenues which the abbey enjoyed from other sources. The character of its architecture—graceful symmetry, lavish profusion of ornament, exquisite delicacy of workmanship—has been familiar to every one since the publication of the "Lay of the Last Minstrel," which presents the structure in lines so admirably true that they have passed as definitions into the handbooks of the ecclesiologists. It is less generally remembered that during most part of the century in which this glory of Scottish art was built, Teviotdale was an English county, and the monks of Melrose were liegemen of the English king.

Development of Basilicas.

The first growth made in basilican building was the transept, which pushed back the apse. To one side, that of the entrance, was attached a square cortile, with open colonnades round, and sometimes a fountain in the centre. In the larger basilicas this seems to have been general, but few of them have survived the changes of so many centuries. This roomy court surrounded by dead walls was familiar, from the accustomed arrangements of the Roman dwelling-houses of the more important class. It is still traceable in the mosque of Sta Sophia of Justinian at Constantinople, the churches of San Vitale at Ravenna, San Clemente at Rome, Sant' Ambrogio at Milan and other churches of the first nine centuries. It has disappeared from all the great basilicas at Rome, though we may take the double colonnades of modern St. Peter's as the representative of that of the ancient building. The Romans attached distinct baptisteries to their churches. These generally followed the type of the existing circular buildings from their obvious applicability. That of St. John Lateran, though altered, is still the same in main lines and parts that was built by Constantine, and in which he was said to have been baptized by Pope St. Sylvester. It is octagonal, and consists of an octagonal colonnade supporting a massive architrave, from which rises a second, supporting the octagonal roof. The lower colonnade is surrounded by a wide passage or aisle for spectators. The centre descends by steps into the font. The contemporary church of Sta Costanza was built for a similar purpose, and was used for the baptism of the imperial family, who were buried in the great porphyry sarcophagus formerly placed in it, but at present in the Vatican gallery. The form of this church is still more elegant. It consists of a circular colonnade of arches on coupled columns, surmounted by a vaulted dome and surrounded by a vaulted aisle. On the same model were built the round church of Nocera and the circular church near Bonn on the Rhine. These were either directly on the plan, or mere modifications of the circular aulæ of the baths, such as those of Diocletian, three of which still subsist. One forms the parish church of San Bernardo, and another, smaller, was incorporated by Vanvitelli into Michel Angelo's adapted church of Sta Maria degli Angeli, that of the Carthusian Fathers. These are well-constructed vaults of brick. The Pantheon, older than any of them, being so vast and massive that it was only the gigantic mind of Michel Angelo that has since conceived the idea of rearing such a mass into the heavens on piers and arches. Another circular church—that of San Stefano on the Cælian, said to be an ancient building—is larger than any of these, excepting the Pantheon, but less scientific. It is surrounded by an aisle, but the central part is traversed by walls on which an ordinary timber roof is supported. It was, however, too large and important to serve merely the purpose of a baptistery. Church architecture in Rome made little progress as to type and form beyond this point. Galleries, a marked feature in the basilicas of a more Byzantine character, are rare in Rome itself. Though a requisite in Constantinople for the use of women, they are not to be found in the early basilicas of Rome, or with few exceptions. That of St. Agnes is of the earliest age; but the fact of the church being built in the Catacombs, and, therefore, several feet below the surface of the ground, may have suggested it. The galleries surround the church on three sides, and are approached from the ground level. A very curious old church, called that of the Quattro Santi Incoronati, has also galleries on its two sides, ending abruptly at the altar end, so as to leave a regular basilican transept between nave and apse, the galleries and their colonnades performing the part of the walls, which usually divide the great basilicas and support their roofs. The church is, perhaps, the most direct representative of the actual basilican hall of the old empire, as to its galleries, in existence.

Devonshire Churches.

A certain deficiency in rich and elaborate ornament, which, as compared with those of other counties, may be observed more or less throughout the churches of Devonshire, is probably owing to the nature of the materials with which the local builders were compelled to work. On the borders of Dartmoor, and indeed wherever it was possible, granite has been used; grand and effective in its heavy masses and simple mouldings, but incapable of being chiselled into the buds and bells, the palm branches and the fern leaves wreathed about the arches and capitals of churches in the sandstone and oolite districts. The ferruginous trap, which is the principal stone in the neighbourhood of Exeter and in great part of North Devon, is scarcely softer than the granite; and although Caen stone was largely imported, and is the chief material used for the cathedral, it found in Devonshire a serious rival in a reddish porphyritic "elvan," known as the Roborough stone (to the old fortress of which hundred it probably gave name, Ro-burh [A. S.], the red castle), which is still quarried in the neighbourhood of Plymouth. None of these materials lent themselves to elaborate carving; and the very rich stone pulpits which remain in some few churches are worked in Caen stone. But, as if by way of compensation for this deficiency, the woodwork, which is still to be admired in the churches of Devonshire, in spite of the terrible havoc to which it has been exposed, even within the last century, probably exceeds in beauty and intricacy of detail that of any other English province. How the native artists luxuriated in twining vine branches, and in all the graceful maze of forest boughs and flowers, we may see in the beautiful screens of Cullompton, of Dartmouth, of Harberton, of Atherington, and of numberless other churches scattered over the county. All were elaborately coloured; and, especially in those churches which belonged to the large monasteries, the lower panels were filled with painted figures of saints, many of which remain, of no ordinary execution, and effective in spite of grotesque accompaniments. In one other point the churches of Devonshire surpass those of most other counties—beauty of situation. Sometimes located close to the old manor-house,

and sheltered by the same ancestral woods; sometimes on high ground, and looking across a wide landscape of coppice and orchard and meadow, to the distant ridges of Dartmoor; and sometimes rising in the midst of the long green coomb, over which the lichen-tinted tower flings the shadow of its own antiquity—it is scarcely possible to determine to which position the "insita species venustatis," such as Bede admired on the hill of St. Alban's martyrdom, belongs most completely. There is something, too, which finely harmonises with the surrounding scene in the influences, visible on the buildings themselves, of the soft mists and warm breezes of the west; and the most thorough-paced ecclesiologist would hardly look with an evil eye on the golden mosses and the hart's-tongue that light up the grey walls with touches of the loveliest colour. Whether he would feel equal sympathy with our own liking for many details in the interior fittings of remote Devonshire churches is perhaps more doubtful. Devonshire has by no means been behindhand in zeal for church building and church restoration; and such results as have been obtained at Cullompton, at Tiverton, at Ottery, at Yealmpton, and in many other places may be pointed out with no small pride and admiration. True restoration, however, demands not only the delicate hand of an artist, but still more, a delicate feeling for local character and sentiment. All situations will not bear the same treatment; and there is many a village church, nestled under the tors of Dartmoor, which, with its worn benches, its dimmed window quarrels, its admonitory texts, and its rough granite pavement, is to us far more impressive in its ancient simplicity than the most elaborate display of carved work and of colour could possibly render it. Such churches retain the old-world character of the district.

A. W. Pugin's Stage Craft.

So completely did the mania for theatrical representations enthral Pugin that he was for ever making experiments in order to produce startling and novel mechanical changes, and he made himself acquainted with all that had been written and published on the subject; but little was to be obtained either from the designs of Peruzzi or any more modern artist. The only man in comparatively recent times who devoted attention to the subject was Inigo Jones, who displayed great fancy and talent, not merely as a scene-painter, but in producing pageants and masques, and planning the decorations and machinery for them. Perhaps Pugin may claim to have done as much in his way for producing correct representations of the pageants of the Middle Ages. With a view to help him in this pursuit his parents allowed him to convert the upper floor of their house in Great Russell Street into a model theatre. This he did at much expense, removing the attic ceiling, cutting away the roof, constructing cisterns, and adapting everything necessary to his object. On this model stage he designed the most exquisite scenery, with fountains, tricks, traps, drop-scenes, wings, soffites, hilly scenes, flats, open flats and every magic change of which stage mechanism is capable. Large parties were invited to witness his performances, and probably a more skilfully made model theatre has never been seen. It was not a toy in any sense of the word, but a piece of construction sufficiently large to enable Pugin to exhibit experiments and study compositions before they were adopted on the actual stage. The intricacy of the mechanism was surprising, but every part was so admirably adjusted that the changes in the scenes, wings and sky-pieces were effected with marvellous rapidity, for it was provided with lines, pulleys, grooves, balance weights, machines for ascents and descents, &c.

The National Gallery.

It was not until the year 1824 that the National Gallery was founded in England. On the death about that time of an eminent connoisseur, Mr. Angerstein, it was suggested that the valuable pictures he had collected should be purchased for the nation. Parliament was induced to grant 57,000*l.* for this purpose, and an additional sum of 3,000*l.* for the expenses of exhibition and preservation. The number of paintings thus acquired was not large, but it included several of the highest merit—such as *The Raising of Lazarus*, by Sebastian del Piombo, four fine Claudes, and Rembrandt's *Woman taken in Adultery*; together with nine admirable specimens of the English school, comprising the portrait of *Lord Heathfield*, by Sir Joshua Reynolds; his own portrait, and the *Marriage à la Mode*, by Hogarth; and Wilkie's *Village Festival*. During the following ten years only four pictures were added by purchase, amongst them, however, the excellent *Bacchus and Ariadne*, of Titian; but thirty were presented to the nation, sixteen having been bequeathed by Sir G. Beaumont to the trustees of the British Museum, who deposited them in the National Gallery. Within the next ten years fifteen were bought, comprising several very important works, such as Correggio's *Mercury instructing Cupid*, Raphael's *St. Catherine*, and the great altar-piece in two divisions, by Francia. During the same period one hundred were presented and bequeathed, including the collections of the Rev. W. H. Carr, Colonel Ollney and Lord Farnborough, the greater part being pictures by the old masters. A National Gallery having thus been founded, the duty devolved upon the Government of providing for its proper administration. On the purchase of the Angerstein collection the Board of Treasury, to which by a strange inconsistency the artistic education of the country had been confided, appointed for the purpose a "keeper," whose duty it was to take charge of the pictures, to negotiate for such as might be selected for purchase, and to regulate the admission of students and the public to the Gallery. A committee of six gentlemen was named to undertake the general superintendence. Subsequently this committee was changed into a trust; the number of trustees was increased to seventeen; and the First Lord of the Treasury and the Chancellor of the Exchequer became *ex officio* members of the Board. But a question no less important than the improved system of management had previously presented itself. Where was the national collection to be exhibited? It had rapidly outgrown the space originally allotted to it, and required a building expressly constructed for its reception. It was at length determined to raise a suitable edifice, and Government chose for this purpose "the finest site in Europe," which had been recently cleared to Charing Cross. In 1832 Mr. W. Wilkins, the architect selected, commenced his work; six years after it was opened to the public. The collection of ancient masters comprised 110 pictures, about the number the rooms allotted to them could conveniently hold, if paintings were hung to be seen, and not as mere furniture to cover the nakedness of the walls.

GENERAL.

A Bust of Thomas Carlyle was unveiled on Saturday in the Valhalla of the Wallace Memorial, Stirling. It is a replica of one in the Corporation Galleries, Glasgow, by Mr. Macgillivray.

An Exhibition of Russian art and industry is to be held next year in the great hall and galleries of the Champ de Mars, Paris.

The Arts Committee of the Liverpool Corporation propose making an application to the Department of Science and Art of the Committee of Council on Education, for a grant in aid of the purchase of casts, including portions of the frieze of the Parthenon, and a selection of casts illustrating the Italian Renaissance.

An Altar Recess, containing some rude frescoes, probably of the fifteenth century, has been brought to light during alterations in progress in the Minster at Wimborne.

The Birmingham City Council have approved of the report from the Museum and School of Art Committee asking for authority to extend the Municipal School of Art, at a cost of 15,000*l.*, upon the land in Cornwall Street already acquired for the purpose.

The Family of the late Mr. Stephen Chesters, of Manchester, have undertaken to defray the cost of the restoration of the south-west bay of the Manchester Cathedral. Estimates for the work are to be prepared.

The Marquis of Ripon, as president, has invited the members of the British Archæological Association to visit Studley Royal and Fountains Abbey during the annual congress, which opens at York on August 17.

The Archæological Section of the Birmingham Midland Institute made an excursion to Kingswood on Saturday, under the guidance of Mr. J. A. Cossins.

The Edinburgh Town Council have agreed to recommend the Corporation to confer the freedom of the city on Sir Daniel Wilson, president of the Toronto University, and author of the work on "Old Edinburgh," who is now on a visit to Scotland.

Mr. Charles Ferguson, architect, Carlisle, has been commissioned to prepare plans for a vicarage house for Holy Trinity Church, Carlisle, which it is proposed to build next spring.

The Wrexham Town Council has decided to build a new school of art adjoining the Guildhall.

The Surrey Convalescent Home, Seaford, was opened by H.R.H. the Duke of Cambridge on Monday. It was erected by an anonymous philanthropist, from Mr. Christian's designs, at a cost of 15,000*l.*

The Committee for the proposed public library at Southampton call the attention of competitors specially to the following alteration in the plan of site:—On the west side of the site set forth in the plan a building line is shown, set back 5 feet from Bedford Road, and having reference to a frontage to that road of 128 feet. This dotted building line is incorrect, and should be disregarded. The correct building line on the west side of the site is the street line of Bedford Road, as shown coloured red on the plan.

The Architect.

THE WEEK.

On Saturday, the 15th inst., the Society of Architects will set out on an excursion to Belgium, and there must be few who will not join in the desire that the journey will be satisfactory throughout. The members are to have an audience with the King of the Belgians soon after their arrival at Ostend—that is, of course, if the condition of the Queen will allow His Majesty to be absent from Brussels. Sunday and Monday will be spent in Bruges, Tuesday in Ghent, Wednesday in Antwerp, Thursday in Malines, Friday in Louvain, Saturday and next day in Brussels. In the second week Mons, Tournai, Courtrai, Oudenarde and Ypres will be visited by all who can remain for that time. The route has been well chosen, and even those who are familiar with the Flemish towns will find pleasure in re-visiting them. The charges are most moderate.

The following is the result of the competition for the artisans' dwellings in Manchester, which are to be erected by the City Council:—*Oldham Road Area*—First premium, 100*l.*, Messrs. Spalding & Cross, Queen Street, Cheapside, London ("Practical"); second premium, 50*l.*, Mr. W. R. Sharp, 13 Exchange Arcade, Manchester ("Simplex"); third premium, 25*l.*, Messrs. Gibson & Russell, Old Bond Street, London ("All Things Considered"). *Pollard Street Area*—First premium, 30*l.*, Messrs. Spalding & Cross; second premium, 20*l.*, Mr. T. L. Worthington, Queen Anne's Gate, London.

On Friday last appeals were heard by the new tribunal against some lines of frontage laid down by the superintending architect of the London County Council, the arbitrators being Messrs. Cates (chairman), Driver and Hutton. In the case of Thomson *v.* London County Council, in which Mr. Bezley, instructed by Mr. Baron, raised an important point as to whether an owner is not entitled to erect buildings on any portion of his forecourt irrespective of the building line provided the house existed previous to the passing of the Metropolitan Building Act, 1855, unless the Vestry or Council should give notice to purchase such land. He quoted the case of Lord Auckland *v.* Westminster District Board of Works (*Law Times Reports*, August 31, 1872), when Justice Mellish ruled that "an owner's courtyard was as much a secret and private place as any other part of his property." Mr. W. T. Hollands, architect, produced plans and models, and proved the width of the Kennington Road, where the property in question is situate, at 79 feet. Mr. Smith defended his vestry, and Mr. Blashill his opinion as to the building line. The arbitrators reserved their decision for further consideration. The case in question, and, in fact, all these appeals are very important both to the owners of frontages on all old roads, as well as to Vestries *v.* London County Council.

When the bronze lion that long surmounted the column of the Piazzetta in Venice was replaced in its present position after the downfall of Napoleon, the Parisians consoled themselves for its removal from the esplanade of the Invalides by saying it was of no value as a work of art, and it certainly suffered by its journey to Paris. But about the antiquity of the work there could be no doubt. As yet inquiry has not determined the age or the origin of the lion. At the last meeting of the Académie des Inscriptions M. Casati endeavoured to prove that it must have been produced in ancient Etruria. He considers it has something in common with the chimera of the Florence Museum and the Leyden griffin. The two imaginative figures are inscribed with the word "Tinscvil" in Etruscan characters, of which various interpretations have been given, but M. Casati considers that it designated the God known as Jupiter or Zeus. A similar word is not to be found on the lion in Venice, but as many of the characteristics of the three works correspond, he concludes that if two of them are Etruscan the third must have had a similar origin. Besides, the Etruscans were the only people in Europe who seemed to be competent to produce so difficult a work. The theory of the Assyrian origin of the lion cannot be supported by any evidence.

An effort was made at the meeting of the Manchester Council on Wednesday to preserve the tower which has survived the demolition of St. Mary's Church, Deansgate. Mr. Waterhouse is an admirer of the tower, and is in favour of upholding it. But the Parks and Cemeteries Committee believe there is no architectural beauty in it, and that it could not be retained with advantage in the open space which was formed about it. There are, it appears, other reasons for the destruction which it is considered prudent not to divulge. Accordingly, it has been decided that the tower is to share the fate of the buildings of which it used to form a part.

The risk of trusting to agreements which are merely oral was exemplified in a case that was tried at the Liverpool Assizes on Wednesday. The plaintiff, Mr. Stirrup, architect, of Blackburn, sought to recover 149*l.* 5*s.* 10*d.* from a local brewing company for work done. He stated that in May 1889 he was commissioned to prepare elevations, plans and specifications for offices, &c., in connection with the brewery in Higher Eanam, Blackburn, and that in July and August 1890 he was again engaged to prepare plans, quantities, &c., for the erection of a new brewery at the same place. The claim was based on 5 per cent. on the lowest tender for the construction of the offices, and 1¼ per cent. on the lowest estimated cost for the erection of the brewery. The defence was that the company had not employed the plaintiff to do the work, and that he did it at his own risk. It was maintained that the designing was a speculative affair on the part of the plaintiff, and he was not to be paid for the work unless it was satisfactory to the defendants. The judge, who heard the case without a jury, found for the defendants with costs.

That artists in Scotland suffer many grievances through the shortcomings of the Royal Scottish Academy is beyond all question, and the defence which the Academicians recently offered for their conduct was the best testimony in favour of the cause of the reformers. A step has just been taken which is likely, however, to do more than any discussion towards convincing the Academicians that their rights are only of minor importance in all questions relating to the advancement of national art. We referred lately to the formation of a Society of Scottish Artists that purposed to be independent of the Academy. The members rightly considered they had some claim on the authorities for a place of exhibition. Application was accordingly made to the Board of Manufactures, that in Scotland has much authority over property which can be utilised for the teaching of art. The board at once agreed to place the eastern part of the Scottish National Gallery at the disposal of the Society of Artists, but stipulated that the exhibitions were not to be confined to the works of painters and sculptors, and that architects, decorators and designers should also have a right to display their works. There will, of course, be no difficulty in carrying out the arrangement, and in fact it is surprising that the Board of Manufactures should be left to make the proposal.

The patronage of the Conseil Municipal of Paris has been distributed this year among the rival exhibitions, but with a difference in amount. Out of the Old Salon the purchases have been, among the paintings, *The Quai du Bercy*, by M. Guillemet, 3,000 frs.; *The Halles*, by M. Dambourgez, 4,000 frs.; and a *Lock on the Sarthe*, by M. Garaud, 4,000 frs.; with two pieces of sculpture, *Nourricière*, in marble, by M. Chatrousse, 12,000 frs.; and *Le Vin*, in bronze, by M. Holveck, 9,000 frs. From the New Salon in the Champ de Mars two vases in *grès émaille*, by M. Delaherche, were obtained for 700 frs.; a statue in marble, *La Jannette*, by M. Baffier, 5,000 frs.; and two pictures, *The Arènes at Arles*, by M. Montenard, 3,000 frs.; and *The Dinner*, by M. Tournes, 2,500 frs. One pastel was purchased from the exhibition of the Indépendants, *A l'Ombre*, by M. Gozlan, for 1,200 frs. The purchases have amounted to 44,400 frs.

THE BERLIN EXHIBITION.

MANY people have expressed dissatisfaction with the awards of medals to exhibitors in the English Section of the Internationale Kunst-Ausstellung of Berlin, because the awards do not correspond with the English estimates of the value of the artists. It generally happens, however, that if such distinctions are honestly given by a jury of artists, and are not prescribed by officials, they cannot be in accordance with the ideas that prevail among the countrymen of the exhibitors. This will be more evident if we remember that in the majority of instances exhibitions, although called international, are not in reality representative of the work of any country. Take the case of England. The artists whose works are most admired find little difficulty in obtaining purchasers for all their pictures. The owners are naturally chary about lending their property unless they are assured of its safety, and it is not easy to satisfy them on that point. There is no doubt, for example, that the completeness of the Manchester Jubilee Exhibition was mainly owing to the association of the house of AGNEW with the enterprise. It was accepted as a matter of course that the partial exertion of such control as Messrs. AGNEW's was a guarantee that the risks attending the transit of works of art would be minimised, and that precautions would be taken to insure safety during the time the exhibition was open. No Government department could succeed in attracting such treasures as were to be seen in the sheds at Old Trafford, and if the committee desired to utilise more pictures, there would be no difficulty in obtaining them.

It is not every exhibition that can offer similar security, and in consequence the choice of works is limited. Instead of beseeching owners to put up with blank spaces on the walls of their galleries for an indefinite time, the committees and promoters of exhibitions must turn to artists for the use of some of the unsold works in their studios, and in that way general and international exhibitions become supplementary to the annual exhibitions of societies and the displays in brokers' shops. It thus happens that, among all the works by English artists which are to be seen in the Berlin Exhibition, only one is described as coming from a public or private collection. England is, however, not peculiar in displaying unsold works; the majority of the pictures from other countries also await purchasers.

In stating these facts we have no wish to depreciate any of the paintings, but at the same time it is well to explain that the Berlin Exhibition is not made up of works that were selected as evidence of the height reached by the painters in various parts of the world. It is simply the best collection that could be made up in spite of many difficulties, and the value of the awards should be determined accordingly. It is not to be supposed the jurors believed that the artists who obtained high-class medals are the foremost in their respective countries. The judgments were determined solely by what was visible in the various sections of the exhibition. Their value, so to speak, is local and counts for nothing outside the triangular plot of ground between the Strasse Alt-Moabit and the Invalidenstrasse in Berlin. In any of the beer-gardens of the city where artists congregate, the awards would be discounted like the criticisms in the evening papers.

Experience in Berlin as elsewhere denotes that it is time for the bestowal of medals in connection with art exhibitions to be given up. The operations make artists ridiculous. The conditions for such a competition can never be arranged fairly. A limited number of men are judged by works which may not be the most characteristic examples of their skill, and their rank is thus settled by chance. But still greater injustice is inflicted on absentees. It is commonly supposed that as a matter of course every exhibition like the one in Berlin must contain works by the foremost artists, and thus, unless they make announcements on all sides that they are not co-operating, the absentees are considered to have suffered defeat because their names do not appear in the list of medallists. On the other hand, men of inferior ability, through the accident of appearing in a circumscribed exhibition and obtaining a medal, may be raised for the moment to a prominence which they cannot be said to have earned and which they cannot retain.

Although the Berlin Exhibition consists of elements that are fortuitous in combination, and the judgments of the jurors cannot be accepted by contemporaries and are not likely to be endorsed by posterity, the sections contain much that will delight artists and amateurs. Since international exhibitions began not one was seen that, as regards painting in oils, was more interesting. Elsewhere the art was compelled to compete with the numerous varieties of industrial work and natural products, but in Berlin it is supreme. Students of painting in particular cannot fail to profit by an attentive examination of works which may be said to embody many theories and traditions. The pictures are so hung as to allow of the study of detail, and as the various schools are kept together, national and local characteristics can be discriminated from those which pertain to individual artists.

On plan the buildings may be said to consist of three principal parts. First is a large square, comprising the courts assigned to Hungary, Austria, Italy, Holland, Belgium, Spain, Denmark, Russia, Norway, Poland and America. There is also an "internationaler Saal," in which works from many countries are found—France and Turkey being among them—but somehow English works are excluded. The Kaiser-Saal forms part of the square. Along two of the sides are several compartments, in which works on a small scale are seen. The second division is almost semicircular in plan. It contains in the middle the English section, which adjoins the Düsseldorf. Along the curve are also compartments for water-colours, pastels, engravings, &c. Finally comes the German building, with sections for Berlin, Dresden, Munich, Karlsruhe and Stuttgart. A separate building contains architectural drawings. The grounds are well-laid out, and among the attractions is an excellent copy of a Greek Doric temple, which at present enshrines a panorama of Constantinople painted by the members of the Verein, which is as illusory as most of those which are the work of specialists. The exhibition building has a satisfactory façade, and is surmounted by a dome, which is adorned with figures that are skilfully foreshortened and have a vivid appearance. The Kaiser-Saal appeals to the hearts of all Germans, for it contains portraits of some of the actors in the scenes connected with the formation of the Empire. But while Count MOLTKE is duly honoured—the portrait of the Field-Marshal on his death-bed shows the fine lines of the skull which in life were concealed by an ugly wig—there is no portrait of Prince BISMARCK.

The German section reveals how far removed the modern paintings are from those which were produced from thirty to fifty years ago, and which still are supposed to reflect the qualities of German art. In colouring, especially, there is a vast difference. As yet the painters have not gone so far as some of their Austrian brethren in the search after chromatic effects, and they are not as successful as the French in the use of quiet colours and in compelling a variety to unite in producing an effect that seems impossible by any other or a simpler arrangement. But if much remains to be done, much has been accomplished, and the German section is one of the most gratifying in the exhibition.

When it is remembered that Germany has gained her supremacy by war, it is astonishing how few pictures of military scenes are to be found in the exhibition. After going through all the independent sections it may be doubted if a visitor could discover half a dozen paintings that relate to the war with France, while the campaign against Austria appears to have passed into the mythic period. There are, of course, portraits of military officers, but they are not shown in action or with such surroundings as at one time in England were considered to be as indispensable as the uniform when the subject was a soldier. In the windows of print shops in German towns there is a similar absence of military scenes. Everywhere there is pride in the army, and there is no forgetfulness of what has been accomplished by disciplined courage; but it seems to be accepted that neither artist nor writer is requisite to keep up the war spirit in any part of the empire. Judging by the paintings, it might be concluded that the Germans are more domesticated than the English. Scenes of simple life are in a majority, portraits as much abound as in an exhibition of the Royal Academy, and there is no lack of landscapes, the subjects being mainly derived from native

scenes. High art seems to be as little patronised as among ourselves, ancient history is rarely utilised for inspiration, and the ideal figures which at one time enabled German artists to display their splendid if somewhat archaic draughtsmanship are out of fashion, or at least for pictures.

There is one class of work which may be said to be peculiar to Germany, and there are many most interesting examples of it in the exhibition. It is known as "Diplome," which may be translated as illumination as applied to addresses. The Germans exceed all other peoples in complimenting and congratulating, for the terms used and the manner of using them suggest genuine cordiality. In England the presentation of addresses is common enough, but the composition is more stiff than anything to be found in a ready letter writer; while the caligraphy is manifestly a production of the law-writer's office, and recalls those ponderous "indentures" on parchment which no party thereto looks at a second time unless under compulsion. A German address is a work of art, and generally shows more inventive power than is seen in the majority of the oil-paintings. The subject inspires novelty. The address may be congratulatory on a birthday or a silver wedding, a testimony of good-fellowship to an emigrant, or of affection from students to a professor, or of gratitude from employés; it may be a humorous "trinker-historie" which will recall happy nights in a keller of which the walls seemed to be an anthology of wise and witty versicles, or a dutiful acknowledgment of loyalty from subjects to a prince; but whatever may be the purpose any competent artist can turn it to account and introduce in the address graceful figures, and that fine and affluent type of ornament which belongs to the German Renaissance. Is it not better for young artists to exercise their talents on work of this kind than remain moping in studios or taverns until the time arrives when the public will be willing to compete for possession of their oil-paintings? There must be a large sum spent every year in England for addresses which, from the style of execution, the possessors are generally afraid to hang in their houses. An imitation of the German practice might therefore be introduced with advantage. An illuminated manuscript like one of those in the Berlin Exhibition would be worthy to adorn a palace, and to be the companion of pictures or statues.

The English section contains about fifty oil-paintings, besides water-colour drawings and etchings; as they have been seen in exhibitions in England the titles will recall their appearance. Sir Frederick Leighton sends an *Idyll*, an Arcadian shepherd piping before two girls, and a *Sibyl*, a figure of a mild prophetess clad in a purple robe, who regards a scroll. Sir J. D. Millais has one portrait, *The Last Rose of Summer*, a girl in a dark-red cap that has no sign of pining or of approaching dissolution. For so hale and hearty a girl the title is a misnomer, and may not be owing to the painter's invention. Sir John Gilbert sends a picture of men crossing a lake, which is described as a subject taken from "Sir Lancelot of the Lake." Sir J. D. Linton has a portrait of *Miss Wardour*. Mr. Watts is represented by one of his ecclesiastical allegories, *Christenthum*, which is a painted sermon to all churches, and by his *Professor Joachim*. The former has faded in the course of its journeys to exhibitions, but the portrait remains a masterpiece. Mr. Ouless has two of his best portraits, the *Cardinal Manning* and *T. S. Cooper, R.A.* There are four portraits by Mr. W. B. Richmond besides his *Venus and Anchises*, which is not his best work. Mr. Herkomer sends six works, and, as a matter of course, *Mein Vater* and *Unser Dorf* figure among them. Mr. J. J. Shannon has two portraits. Mr. Walter Crane rarely meets with justice in a picture exhibition, and his animated painting of the fleeting hours, *Die eilenden Stunden*, is placed as high in the Berlin-saal as it would be in London. But the vigour and skill in arrangement cannot be entirely obscured. Mr. Alma-Tadema contributes his *Adrian at a Romano-British Pottery*, but as no marble is apparent, there must be much disappointment among visitors, that is hardly compensated by the mosaic, woodwork and pottery which are the principal elements in the painting. Another picture of the same period is Mr. Madox Brown's small replica of one of his mural paintings in the Manchester Town Hall, representing the laying-out of "Castræ Mancuniensia" under the direction of Roman soldiers. It is a picture that is historically interesting, as a record of the intensity of English pre-Raphaelitism. Mr. Poynter's cabinet work, *On the Temple Steps*, a Roman girl at a privileged fruit stall, reappears in Berlin. Mr. Stanhope Forbes's *Auction*, in which the pathos is deepened by the prosiness of the transaction, is enough to suggest the principles of the Newlyn school. Mr. Colin Hunter's *See-Silber*, a northern harbour with fishing-boats, refreshes the eyes; and as the blues in the *Westwärts*, by Mr. Henry Moore, have become softened, and the sun does suggest a glow, it must also please many an inland dweller. Mr. E. A. Waterlow merits much for discovering Connemara. *Die Waise* shows a shepherd boy who is a careful nurse for motherless lambs, but the group is subordinate to the landscape in which an arm of the Atlantic, a quiet lake and great purple mountains combine with the greenest of pasture, and all appear as if no more than a transcript from a real scene. A picture from one of Shakespeare's plays would secure more attention in Berlin than in London, but English artists know the risk of painting one. That the power of representing dramatic or melodramatic incidents on canvas has not entirely vanished is shown by Mr. Pettie's *Traitor*, where a man is seen lying on the floor at the mercy of his fellow conspirators. The scene is impressive, while free from all exaggeration or staginess. The painter's *Head of a Spanish Admiral* seems to be a portrait of a gentleman who could not have shared in the defeat of the Armada.

In addition are paintings by Mr. Boughton, Mr. J. Collier, Mr. Haynes Williams, Mr. Yeend King, Mr. Moberley, Mr. D. Murray, Mr. Moscheles, Mr. H. R. Robertson, Mr. Wirgman and Mr. Wyllie. The water-colour drawings are by Mr. Abbey, Mr. Parsons, Mr. Aumonier, Mr. T. Collier, Mr. Cuxmoore, Mr. A. East, Mr. Fulleylove, Sir J. Gilbert, Mr. C. Green, Mr. C. O. Murray, Mr. Orrock, Mr. Walker and Mr. Werner. It is needless to say that several prominent artists are absentees.

(*To be continued.*)

RECENT GERMAN ORIENTAL EXPLORATIONS.

ALTHOUGH for many years Germany has occupied the leading position in Oriental studies and the work of her students has been characterised by a most thorough investigation of the subject, it was not until quite recently, says the *Scotsman*, that the Germans entered the field of Oriental exploration. The old Museum at Berlin, built in 1828 by Frederick William III., remained for a long time without any Oriental collection. From time to time consuls in various parts of the East forwarded objects to the Prussian Museum, and one of the best collections is that of Oriental gems obtained by Baron Petermann during his travels. In the year 1845 there was discovered at Larnaca, in Cyprus, the site of the ancient Kition, a black basalt monolith with the figure of an Assyrian king upon it, the front and sides of which were covered by a long inscription in archaic characters. Previous to being noticed by European archæologists, the sculpture had been sawn in half lengthways, and the back position of it was known to have done duty for some years as the counter in a baker's shop. The larger portion was obtained by Mr. Ross, a well-known Eastern traveller, for the Royal Museum at Berlin, and was found to bear an inscription of Sargon II., B.C. 721, the conqueror of Samaria, who sent the monument to Cyprus to be erected after having received tribute from the kings of that island. Anxious to have, at least, some representative examples of Assyrian art, the late Baron von Bunsen, Prussian Ambassador in London, obtained casts of many of the best of the sculptures obtained by Sir Henry Layard. It was not until the year 1888, however, that Germany began to take an active part in Oriental exploration. In 1886 and 1887 a private expedition had visited Babylonia and the districts of Northern Syria; and the report brought back by this mission was so satisfactory that it was determined to take more systematic measures. This resulted in the formation of the Oriental Committee, under the presidency of the well-known archæologist, Professor von Kauffmann, which numbers among its members almost all the best known archæologists and Orientalists in Germany. The first work of this committee was to despatch an expedition to Asia Minor to study the Hittite antiquities. Having traversed the great military and commercial road which intersected the country from the slopes of the Taurus to the

shores of the Ægean, the expedition, which was under the direction of Dr. Humann, decided to commence operations at a site where some antiquities had been obtained a few years previously. The mound of Sendscherly is situated on the old road which leads from Marash through the plain of northern Syria along the eastern slopes of the Taurus down to the Gulf of Alexandretta, the ancient Bay of Issus. The mound is situated near to a pass through which a roadway leads into the Cilician plain, and was evidently the site of one of the celebrated Cilician gates. The work of excavation brought to light the remains of an extensive palace, strongly built of black basalt and dolorite, and decorated with numerous sculptures in the archaic style of Hittite art. Many of these have been transmitted to Berlin, and of others careful casts have been taken. The entrance to the palace was guarded by a pair of colossal lions, rude and archaic in style, resembling somewhat the lion found at the entrance to the temple of the war god at Nimroud, near Nineveh. They also present a slight similarity to the sphinxes found by Perrot at Eyuk. The sculptures which decorate the building are extremely interesting. They show a curious mixture of the art of Assyria and Egypt—the result of a long-continued contact with both nations. In one example, which perhaps is a gravestone, the fusion of the two styles is very remarkable. On the left-hand side of the bas-relief there are portions of the large figure of a god clad in a long robe in the Assyrian style, and wearing turned-up shoes. He holds in his hands a species of rude guitar, and may have been the Hittite Apollo, perhaps another form of the Cypriote Gingiras. In front of the figure is a small table altar with cross legs, and upon it a pile of offerings consisting of bread, fish and the head of a goose or duck.

Now this object is extremely curious, as it is manifestly a copy of the table altar so often occurring on the Egyptian funereal tablets, and which is described as the table upon which are placed all good things. The priest, who stands beside the altar, is evidently one of the *galli* or eunuch priests, with a beardless, effeminate face, having his hair in long ringlets and wearing earrings. He has in one hand a libation cup and in the other a long feather fan. At the bottom of the stole is a representation, apparently of the warrior to whom it was erected, who holds his lance in his hands point downwards indicating death, and leads by his side a horse. The whole style of this monument is very archaic, and may be attributed to certainly the fifteenth century B.C. Many of the forms discovered here are familiar to us in Greek art, and are extremely important as showing the source from which they came, and the enormous influence which the symbolism of Asia Minor had upon the Greek sculptor. We have the winged horse-headed sphinx, a curious form of Pegasus, the eagle-headed demon and the Asiatic female sphinx, a form introduced into Egypt by the Hyksos conquerors from throughout the shores of the Mediterranean, and on the archaic stole at Olympia and on a Phœnician plaque found in Sardinia. In the figures of Hittite warriors here the form of the shield is very remarkable, as it is exactly the form which the Greek vase-painters gave to the Trojan shields, and is also, curiously enough, the form found in the bronzes in the tombs at Spata and in Sardinia. The question now arises, have we any information as to the name of this ancient city kingdom? This we can fortunately answer in the affirmative. In one of the chambers of the palace were discovered the remains of two colossal statues in black basalt, resembling very much in character Phœnician sarcophagi. The larger of these has the head preserved, and represents a curious bearded and long-locked divinity wearing a horned cap. This is evidently a solar divinity. Upon the body of the figure there is written a long inscription in Aramaic-Phœnician characters, which states that it is the statue of the god Hadad, dedicated by Panamnur, King of Samal. Now, Panamnur was a contemporary of Tiglath-Pileser III., and paid tribute to him at Damascus in 732, along with Ahaz, King of Judah. The kingdom of Samal was a very old one, and is mentioned as early as 1600 B.C. in the list of Thothmes III. It seems to have been one of the leading centres of the confederacies of Northern Syria. There remains one other very important monument to be mentioned. In one of the rooms was found a stone monolith, about 10 feet high, which bore a long inscription of Esarhaddon, son of Sennacherib, describing his conquest of Egypt and the capture of Memphis. The inscription tells how a battle took place on the frontiers of Egypt early in the mouth Tammuz, and was followed by two other battles on the 16th and 18th days of the month, resulting in the capture of Memphis on the 22nd day of the month, after half a day's fighting. On the front of the monolith is a representation of Esarhaddon, and at his feet figures of two captive kings. One of these is a negro wearing the royal crown of Egypt, with the sacred serpent on his brow, and is evidently meant for Tarhaka, the Ethiopian king of Egypt. The second figure is probably that of the King of Samal. The discovery of this monument is extremely important, as it gives a marvellous description of one of the most important events in Oriental history. The discoveries at Sendscherly afford another striking example of the enormous wealth of material which lies buried beneath obscure Turkish ruins, and it is to be hoped that the success of the German Oriental Committee will induce many others to enter this rich field, where "the harvest truly is plenteous but the labourers few."

JERVAULX ABBEY AND MIDDLEHAM CASTLE.

THE members of the Yorkshire Archæological and Topographical Association were enabled last week to visit Jervaulx Abbey and Middleham Castle. According to the *Leeds Mercury*, the owner, Lord Masham, of Swinton, regards present-day archæologists as an evolutionary product of the last quarter of the century, but gives them cordial welcome withal, despite that they are many. Not surprising was the greeting, since coming mainly from the large towns—town-dwellers who are the more devoted to research because objects of investigation are removed from the crowd—they assume the form not of destroying angels, but of those professing a mission for the preservation of the "glorious ruins of antiquity." Such rare remains they were able, by Lord Masham's kindness, to investigate in Jervaulx Abbey and Middleham Castle. The excellence of the opportunity was clear to Yorkshire archæologists, else, despite the lowest barometer of the month, and the "very wet" prognosticated by the weather prophets, lady and gentlemen members, comprising contingents from Huddersfield, Bradford, Wakefield, Leeds, Harrogate and Northallerton, and conveyed by special train to Jervaulx, would scarcely have mustered to the number of quite three hundred to partake of the luncheon so kindly provided in the grounds of the newly-titled Baron of Swinton. This "bumper" excursion was truly a happy circumstance, since it celebrated the semi-jubilee of the Association. The results of the day's work and the charming weather enjoyed compensated for attendance and the incumbrance of umbrellas and mackintoshes, which occasional showers in the afternoon did not make quite superfluous. Under somewhat lowering skies, here and there relieved by patches of azure, the surrounding objects were most pleasant to look upon. How bravely these stood out in the landscape—the dark clumps of distant trees, the deep blue of the far-away hills, the light green of the opening vales; while along the incense-breathing country lanes, breaking the reaches between noble trees, were the meadow-sweet, woodbine, the dog-rose, bracken and waving grass, and beyond the tinted hedgerows red and white cattle, companies of sheep, and surprised groups garnering the hay.

Jervaulx and Middleham are words of import to those informed of their picturesque and historic associations. Few piles are in better preservation than the monastery of the White Friars and the great stronghold of Warwick, the king-maker. Jervaulx or Gervis stands in well-kept and picturesque grounds not far distant from the valley in which Miles Coverdale, translator of the English Bible, was born. The abbey was first founded A.D. 1141, in the reign of Stephen, by Acarius, son of Bardolf and nephew of Bodin, who gave land at Fors, in Wensleydale, to Peter de Quincey and other monks of Savigny. But the inclement situation led to removal to East Witton, on the banks of the Ure, where a colony from Byland commenced the house in 1150, and carried out its erection upon "one contemporary and consistent plan." It is recorded that the last of the abbots was executed at Tyburn for having taken part in the Pilgrimage of Grace, while readers of the Waverley Novels will scarcely need a reminder that Prior Aymer, of Jervaulx, was not an unimportant personage in the story of Ivanhoe. The buildings themselves, according to Mr. St. John Hope, were mainly arranged around the large square formed by the cloisters, and had covered passages on the four sides, forming communication between the church and the other parts of the abbey. There were two great divisions, one belonging to the learned friars and the other to the working and unlettered brothers or *conversi*, who were, however, not a lower class than the lettered monks. The abbey probably included about fifty monks and two or three hundred conversi. The former occupied the eastern side and the latter the western portion of the abbey; and they had also a similar division in the church, where walls were built between the pillars of the aisles. In many respects the abbey is similar in treatment to Fountains; but at Jervaulx the superstructure, save a picturesque piece of the monks' dormitory, has largely disappeared. Mr. St. John Hope spoke of the various relations of the structure to those of Fountains and Kirkstall, pointed out the uses of the buildings, and especially called attention to the plan of the church, where a complete altar remains, and to the handsome chapter-house with monoliths in marble. Passing along to Middleham the visitors crossed the cover, and singled out of the range of hills East Witton Fell and Pen Hill. The castle was founded soon after the Conquest by Robert Fitz Ranulph, grandson of Ribald, one of the followers of William;

but in the thirteenth century the castle and the lands of Middleham came by marriage into the family of Neville. Its most celebrated owner was Richard Neville, Earl of Warwick, "the setter up and plucker down of kings," who often at Middleham entertained Edward IV., against whom he afterwards contracted such enmity as to espouse the cause of Henry VI., whom he had been the means of deposing. This castle, with a keep said to be one of the finest in the country, consists of an outwork fortified with four towers, and enclosing the keep. Mr. Atthill says:—"This envelope forms a right-angled parallelogram 210 feet by 175 feet. The Norman keep, the fortress of the first lords, not being sufficient for the vast trains and princely habits of the Nevilles was enclosed by a complete quadrangle, and the first structure now stands completely insulated in the centre of a later work." A section of the party also visited Middleham Church, dedicated to St. Mary and St. Alkelda, the latter the daughter of a Saxon prince, and who suffered martyrdom by strangulation at the hands of the Danes. Her remains are supposed to repose in the church, and her name is preserved by a well hard by.

Luncheon was served in a tent in the abbey grounds, following the inspection of the monastery.

Lord Masham, who presided, observed that he understood the only toast on those occasions was that of "The Yorkshire Archæological Society." He was pleased to see around him such a numerous body, and he was only sorry that he had not known they were to be so numerous, else he would have been better prepared. That they had mustered so strongly he regarded as a compliment, because he believed that was the most numerous meeting the Society had ever held. Although not an archæologist, he had listened with considerable interest to the learned and entertaining lecture upon the abbey by Mr. St. John Hope, and he trusted that a printed account of the old abbey might be issued, because the details presented differed from that previously given to him, and certainly it was very important that the truth should be made known. If 150 years ago they had had such a body of archæologists—if the Lord of Jervaulx could have been surrounded by such a body of archæologists as he saw around him that day, they might not have now had before them at that place the wreck of to-day, and they would have needed no learned expert to indicate to them the character of the abbey as it formerly existed, since they could have seen for themselves the points of the buildings and the uses to which the various parts had been assigned. He supposed, however, that on the Darwinian principle the archæologists must have been evolved during the last quarter of a century, at any rate, they had become very numerous during that period. Speaking personally, he had a stronger liking for castles than for abbeys, and he had much rather that the castle of the Earl of Warwick at Middleham had been preserved than the abbey at Jervaulx, although the latter might have been a very fine structure. They had many abbeys, but they had only one castle belonging to Warwick the King-maker, and he thought had it been properly preserved it would have been one of the most interesting relics of olden times. Had it remained in its former state, it would have been worth half of Wensleydale, since pilgrims from all parts of England, Australia and other places inhabited by English people would have come to inspect the glorious remains of that old stronghold. But the people, by their parsimony, had been led to pull down parts of the structure, and to build barns of the material and that sort of thing. He hoped that in future better care would be taken of what was left. That historic castle once belonged, according to Bulwer Lytton, to "The Last of the Barons," and perhaps they might allow him to say that it belonged once more to the last of the barons.

Colonel Brooke (chairman of the Council) responded. He congratulated Lord Masham on succeeding to the magnificent domain of Jervaulx; but if he gathered his feelings aright he felt more proud of being the successor of the Salisburys and the Warwicks and the great family of Neville in the stronghold of Middleham. The domain had fallen into the hands of a worthy successor, and he trusted those who followed his lordship might long be spared to preserve and enjoy these grand remains, and to hand them down for many years with the same feelings which his lordship had so well expressed that day. On behalf of the Society he thanked Lord Masham for the cordial reception given them, and also Mr. Christie, who had so energetically seconded his lordship's efforts in the arrangements made for their reception. He begged to propose the health of their noble entertainer—Lord Masham.

Lord Masham, responding to the toast, said that in preserving these historic remains it was very difficult to know—and it was very desirable people should be taught—how rightly to preserve them. Some persons stated that ivy destroyed an old ruin, and others made assertions to the contrary. He was very anxious, and Mr. Christie, who lived at Jervaulx, was very anxious to know which was the better course. But doctors differed, and some questioned what, without ivy, a ruin would be worth. While the tooth of time would little by little take away a building as well as other things, it was for archæologists to say what was desirable for its utmost preservation.

A vote of thanks was passed to Mr. St. John Hope, on the motion of Colonel Brooke, who also proposed six new members for adoption.

Mr. St. John Hope, responding, said he would be glad to prepare for publication in the "Yorkshire Archæological Journal" a description of the abbey. With respect to the ivy question, he was one who held that while ivy was an extremely beautiful plant in its proper place, he did not consider that any ancient ruin was the proper place for ivy. Ivy was extremely picturesque, and one regretted its removal from that point of view. But it became a question whether an abbey was to exist for the sake of the ivy, or whether the ivy should be allowed to pursue its pernicious work of reducing a ruin, stone by stone, until our successors in a few centuries would have no ruin to admire. He held that it would be selfish to allow the ivy under such a prospect to continue its wicked course. Lord Ripon had allowed him to deal with the ivy at Fountains, and one of the last things Lord Edward Cavendish did was to assent to its removal from Furness Abbey and to the walls being carefully pointed. He was glad the ivy was not doing as much damage at Middleham as at Jervaulx, but for all that it should be removed. There were one or two parts of the great keep at Middleham which, unless propped, might fall at any time, and it would be sad for it to become a hopeless ruin, seeing that it was one of the finest and largest in the kingdom.

SCOTTISH ASSOCIATION FOR THE PROMOTION OF THE FINE ARTS.

THE report of the committee of management of this Society for the year 1890-91 states that, owing to the troubles in South America, the membership from that quarter had fallen off to some extent. The subscriptions for the year had amounted to 2,319*l.*, whereof Edinburgh contributed 824*l.* Out of the sum placed at their disposal, the committee had purchased, at a cost of 349*l.* 9*s.*, from the recent exhibition of the Royal Scottish Academy, and at a cost of 194*l.* 2*s.* from the exhibition of the Glasgow Institute of Fine Arts, twenty-two works of art, of which seventeen were oil-paintings and five were water-colour drawings. In addition to the purchases from the Royal Scottish Academy and from the Glasgow Institute of Fine Arts, the committee had commissioned, at a cost of 221*l.* 13*s.*, the late Sir William Fettes Douglas to execute three, Mr. R. B. Nisbet four, Mr. C. H. Mackie three, and Mr. James Paterson three water-colour drawings illustrative of the scenery on the river Tay—these drawings being included in the year's distribution. The three drawings by the late President of the Royal Scottish Academy were among the last works done by him. They were very beautiful specimens of Sir William's work, and would be much valued mementoes of the eminent artist. The committee took the opportunity of recording their deep sense of the loss sustained by Scottish art in the death of Sir William Fettes Douglas, several of whose paintings had been among the most valuable prize works of art purchased by the Association. The committee reminded the members of the Association that the presentation work for the year 1885 consisted of a volume containing a series of eight engravings (photogravures) from paintings by Sir William Fettes Douglas, with a portrait and biographical sketch of the president. The presentation work for the year consists of a volume, suitable for library or table, of reproductions of the water-colour drawings by Sir William Fettes Douglas, Mr. Nisbet, Mr. C. H. Mackie and Mr. Paterson, in illustration of the scenery of the river Tay, and containing descriptive notices of the scenes represented. In consequence of the expression of a desire by many of the subscribers that the next presentation work should consist of an important single plate, the committee came to the opinion that it would give general satisfaction to the subscribers were they to be presented with an etching on a large scale of an important painting by one of the old masters, and they had the pleasure of reporting that the Earl of Elgin had given permission to the committee to etch the famous equestrian portrait in his lordship's possession of the celebrated statesman Don Gaspar de Guzman, Comte-duc d'Olivarès, minister to Philip IV., contemporary of Buckingham and Richelieu and patron of Velasquez. The committee took the opportunity of publicly tendering their acknowledgments to Lord Elgin for his great kindness in consenting to allow the picture to be etched. They had commissioned Mr. Hole, R.S.A., to execute the work. The sum at the credit of the National Gallery fund was reported to amount at present to upwards of 500*l.*, including ½ per cent. of the year's subscriptions, in accordance with the charter of the Association. The total sum expended up to this time by the various committees of management in the acquisition of paintings and sculpture

for the members, in the purchase of pictures for permanent preservation in the Scottish National Gallery, and in the production of engravings and illustrated works for circulation among the subscribers, now amounted to upwards of 175,000*l.*

TESSERÆ.

Detail in Painting.

THE contempt expressed for paintings of fruit, flowers, and what is called still life, is, like most other general and unqualified expressions of the kind, unjust; for though it be true that an artist may be able to paint such things well without possessing skill in any of the higher branches of the art, the converse is not so, no artist having been able to paint great things well who could not also paint little things. In the grandest and most perfect production of the pencil, the *Peter Martyr* of Titian, all the trailing plants, spreading leaves and flowers which decorate the foreground are painted from nature, with all the accurate truth of a botanist, though with all the light, airy, playful brilliancy and harmony of effect of a great master. We are aware, indeed, that Sir Joshua Reynolds has hastily denied the fact, and the merit of it if it were so; but the picture, though injured, is still existing to attest it; and if significant and entertaining objects can be employed in such decorations, common sense proclaims them to be preferable to unmeaning blots and random flourishes, which, like all other ornaments signifying nothing, have an offensive character of obtrusive affectation. Hence, so far from despising skilful and elegant imitations of such objects, all the great masters of the art have studiously practised and successfully employed them; and, in proportion to their general excellence in the whole, has been their particular excellence in these subordinate parts. The leaves, fruits and flowers of Titian and Rubens are far superior to those of any professed and exclusive painter of such subjects, and their vases, phials and implements to those of any other artist whatsoever. Even the patriarchs of the truly grand and severe style, the founders of the Roman and Bolognese schools, found it expedient to pay no less attention to these matters of decoration, as the fruit in a picture of Ludovico Caracci, in the Earl of Ashburnham's collection, and the writing-desk, inkstand, books and hour-glass in a portrait of Cardinal Ribbiena by Raphael, publicly exhibited some years in London, may sufficiently evince. Teniers might have envied the fidelity, delicacy and transparency with which the latter are finished. Neither did Salvator Rosa, the most bold, negligent and sketchy of the great painters, think it beneath him to attend to such matters, as appears by the admirable truth, force and brilliancy with which the withered leaves, tattered volumes and bones of fishes and animals are finished in his picture of Democritus.

Colour in the Arts.

The thing in the sense of art called "colour" is never absolute in itself, but derives its value, like the varying lots of human life, from comparison with what is next and around it. The same tint will be bright or dull, according to its environments. As a rule, no colour in a fine work will be found so bright as it looks, and inversely, no colour in bad or ordinary work will look so bright as it is. A tawny sail on a gray sea and sky by Ruysdael will shine like a ruby, while all the reds, blues and yellows, indiscriminately shuffled together, as in some of the painted glass of the present day, will fail to produce the effect of brilliancy, and, indeed, each of them will destroy its neighbour. Of this principle of interdependence in the scale of his palette the true painter becomes more and more conscious, his chief art being to work it out in practice. But no similar consciousness can be attributed to unreasoning races. Therefore, for such evidences of the prevalence of fine colour as are found among them, a different operation of the same principle must be sought. In countries where there is much light we shall invariably find rich and harmonious colouring in the costumes of men and the trappings of animals. Much light bleaches the landscape, and for the greater part of the year, and, in some localities, for the year round, the eye rests only on an arid and neutral-coloured world. This monotony renders all colour, as such, both precious and distinct. Nature sets the example by the brilliant plumage of her birds, and the hues of smaller creatures—a brilliancy never raw or crude; and nature herself gives the materials as well as the example for the same harmonies in the accessories of human life. Eastern races have for ages been aware that only the rich and true colours supplied by their native dyes—the madders, indigos, &c.—and their combinations, will stand the hot and dazzling conditions of their climate. The use of these colours has therefore become such a mere habit that the reasons for their preference may be said to be forgotten. The selection of the fittest has been made for them by nature herself; it being reserved for the Englishwoman in India, who ignores this law, to discover with dismay the dirty mixture to which her fresh Parisian dress in the last tint of the fashion is promptly reduced. Even in their fadings the dyes of India and Arabia—aided by the quality of the native wools, which have an affinity for them—maintain their relative harmonies; and the painter will often prefer the worn rug or robe to the new one. Nor must we overlook another reason for richness and depth of tone, equally independent of the taste of man; namely, the use of colour as an ingredient of distinctness. Seen from afar, across the neutral mass of the ocean, the brilliant hues of the ship's flag or pennon are no matter of mere taste or fancy, but of necessity. In the same way the robe and the turban of the traveller in the desert, and the housings of his horse or camel, have their allotted purpose. Thus it appears that the harmonious combinations of the Persian carpet or Indian shawl are hardly to be credited so much to the "feeling for colour" of the native weaver as to the light and heat which render all false tints fugitive and which these combinations alone resist; the providence of nature having also bestowed materials in which he can hardly go amiss. Not that we would deny to the Eastern weaver, who in such countries offers the only approach to the position of a painter, the exercise of taste, and that sometimes of a high kind, the result of the culture of the eye under long-continued traditional arrangements; but he moves and works, to a great extent, in a groove formed for centuries before him. To turn now to our own land, where, far from having the light and heat and consequent neutral monotony of landscape to which we have endeavoured to trace the use of the rich colouring of the East, our native landscape presents, more or less, all the year round, a mass of that colour most foreign to the Oriental eye and most grateful to our own, namely, that of a soft and refreshing verdure. We sigh for nothing better, nor for more harmonious correlatives than the time-worn hues of stone or brick—the gray church tower and the old brick mansion—the neutral yellows and grays of the cornfield, whether in ear or stubble, and the ever-changing varieties of gray and luminous cloud, all of which receive a relative value from the surrounding green. Other forms of so-called "colour," such as masses of sparkling mosaic, patches of enamel, painted architecture, even precious marbles, are not what the prevalent tones of English landscape and sky really relieve. The lady's Indian shawl is known to be the true and choice thing by a limited jury, but, in her heart, the lady's maid thinks it a dull affair to have cost so much. For we have not light, and therefore neutral tint enough to set it off. That under these differing and even unfavouring conditions English art, from the period of its revival, should have been pre-eminent in the quality of "colour," may be said to be in some degree also the natural consequence of our external world. Dingy cities and gloomy skies engender the desire for mimic scenes of greater brightness. It is characteristic that modern Italian painters frequently choose those misty effects they seldom see—we have too much of them.

Titian as a Painter.

How really to distinguish Titian from the numerous good Venetian painters of his time is a question only answered by an experienced eye. For pictures are like brothers and sisters; however strong the family likeness between them, it vanishes when each member becomes well known. It is soon found, therefore, that Palma, Tintoret and Bonifazio are really as distinct from Titian as from each other. There are works by Titian, such as his *Bacchus and Ariadne*, and his tragically and probably treacherously destroyed *Peter Martyr*, which stand alone as his. But, for purposes of comparison, we must take him in the range of subjects more common to the school. Here he may be distinguished not so exclusively by his colour, his drapery, or his modes of composition, though individual in each, as by the quality he understood to give to his surface. No one more effectually attained that concealment of his means which is the aim of every true painter. His work shows no paint. What is technically called "the palette" is imperceptible. He perceived that in nature texture lies beneath colour, and that the one must be obtained in order to command the other. He observed that nature expresses her differences not only by contrasts of black and white, red and green, or blue and yellow, but by appositions of the transparent and the opaque, the hard and the soft, the rough and the smooth and the dull and the sparkling—each relieving and making prominent the other. For "things, save by their opposites, appear not." The colours he used are known to have been few and common; it was the infinite changes he rang upon them, the varieties of surface he extracted from them, which produced his subtle and mysterious gradations. No one studied the chemistry of effect as he did; the superposition of one tint upon another, the blood beneath the skin, the light within the shade, the colour in the depths. No one so far carried the power which gives to the result of skill the appearance of happy accident. Titian's pictures seen in an early stage were described by a contemporary as "gemmed all over" with solid touches and masses of paint, destined to be masked and united by an overgrowth of the subtlest operations of brush and finger. Palma Giovane, who was for years in Titian's school, has described how canvases in this state would be placed aside for

months, that the master would then lift them up and examine them with a sternness of expression "as if they were his mortal enemies," and set to work like one possessed. Nothing can be truer to life than this description. A painter staring into his first sketch is like a seer looking into futurity—dimly seeing what is to be. Palma Giovane adds that the master kept many pictures going at a time, turning from one to the other, laying on colour or blending tints with a rub of his finger, and, in the last operations, working far more with his fingers than with his brush. Artists and connoisseurs have in vain interrogated the pictures themselves as to the method that produced them. It is told of a Bergamasque painter that in the endeavour to discover the secret of the transparency and luminousness of the blood tints he scraped a fine head to the canvas, and in vain. He might as well have pulled a flower to pieces to know how it grew. Had he asked Titian himself we may be sure the painter could not have told him. Feeling gropes its way to what it seeks, but has no precise rules for the route; where these begin nature leaves off, and mechanical mannerism takes her place. It was this pure feeling which taught him not only what to do, but when to have done. Titian touched and retouched, glazed and scumbled, veil over veil and film over film, but from no false fastidiousness, rather undoing in the end than overdoing the effect of finish.

St. Petronius, Bologna.

St. Petronius takes precedence of the cathedral of Bologna. Erected at the period of Bolognese liberty, about the end of the fourteenth century, at the expense of the parish, this church is a monument of the religious magnificence of the republics in the Middle Ages, and a proof of the eminence and importance of their artists. The architect Antonio Vincenzi was one of the sixteen *riformatori*, and had been ambassador at Venice. St. Petronius is resplendent with the beauties of art. The sibyls on the doors sculptured by Tribolo, the timorous fellow-traveller of Benvenuto Cellini, have the purity and elegance of Raphael. The prophets, the ornaments of the smaller doors, the basso-relievos of Adam and Eve, especially the figure of Eve spinning, with her first children embracing her knees, and the other figures by Jacopo della Quercia, are excellent. Michel Angelo supplied the designs for the magnificent but sombre-painted windows of St. Anthony's Chapel, and these fragile works reveal his power and expression. Among the archives are sixteen designs for completing the front of the church. Four are attributed to Palladio, but as on one of them he wrote "Laudo il presente disegno," it may be concluded that they are the work of one of his friends, for he was among the most unassuming of men. One design is by Vignola, which secured the approval of Giulio Romano and Cristoforo Lombardo; another is by his rival, Jacopo Ranuccio. There are also designs by Tibaldo, Peruzzi, Giulio Romano, Alberti da Borgo, San Sepolcro. One by Francesco Terribilia was approved by the Senate of Bologna in 1580. Cardinal Geronimo Gastaldi, legate of Bologna in 1678, offered to complete the front at his own cost on condition that he was allowed to introduce his armorial bearings as part of the design. The proposal met with a dignified refusal. The Cardinal, in order to gratify his passion for building, then erected two churches near the Porta del Popolo, Rome, which indicate his deficiencies of taste.

Egyptian Monuments.

Upon looking at the monuments of ancient Egypt anterior to the eighteenth dynasty we find two great groups belonging to distinct ages, which are in a certain measure connected, but certainly not linked together by other minor groups which can be proved to stand between them. The first of these groups is that of the pyramids of Gizeh and of the tombs surrounding them. These are unquestionably the oldest monuments of Egypt, and probably of the world. Their massive architecture, which wears an air of primæval antiquity, the similarity of their form to primitive structures in various parts of the world, and the archaic style of the sculptures of the tombs, alike prove their remote age. The subjects of the sculptures also differ greatly from those of later Egyptian art. One of the most striking and remarkable distinctions is the absence of representations of divinities and funeral rites, which are constantly found in tombs of a later period. The manners and customs belong to a primitive age. Labouring men are usually represented naked, which is not usual in other monuments; the chief occupations are connected with agriculture and the tending of cattle, and there is no trace of an army. The language appears in a more primitive form, and the inscriptions, which are for the most part merely descriptive of the sculptures, are very difficult to read. The second important group of monuments bears the names of the kings of Manetho's twelfth dynasty. They consist of a small temple, remains of other temples, tombs, obelisks and statues. The architecture is very different from that of the Pyramids, being less massive and more elegant. The sculptures, though still resembling in style those of an earlier date, exhibit a considerable advance. Separate statues have a better form and superior finish. The animals are admirably represented. There is still an absence of religious representations in the tombs, but divinities are portrayed upon other monuments. The subjects are of a less simple character than previously. The arts appear to have been more advanced, and life to have been more refined and luxurious. Soldiers are represented, and the labourers are usually clothed. The language is more developed, and perhaps may be considered to have reached its perfect state. Such is the impression which an intelligent observer would receive upon examining the monuments on the spot. He could have no doubt of the relative age of the two groups, but he would find no means of determining the period of time which intervened between them. He could see that no one in Egypt could possibly confound two such different epochs, and that therefore the priests would place, as a matter of course, the kings of the first group in an earlier dynasty than those of the second group. So far Manetho's account is confirmed by the monuments, but further than this we cannot venture to go before the eighteenth dynasty. Our real knowledge of the most ancient history of Egypt is almost entirely confined to the Pyramids and their builders.

"Pentimenti" in Italian Painting.

Nothing is more common than for copyists and dealers to show what the Italians call *pentimenti*, that is, alterations made in the composition of pictures during the progress of the painting, as proofs of authenticity in works attributed to these old masters; but they are in reality the direct contrary, their process, for the most part, allowing no such alterations. Giorgione, who was extremely deficient in drawing, and after him Titian, began with a dead colouring or substratum of middle tint, equally laid upon an absorbent ground spread over wood or cloth, which they worked up with repeated coats, till it reached their ideas of just imitation, and then finished and harmonised the whole with those glowing tints of thin transparent glazing which so few of their pictures now retain. By these means they not only obtained the power of altering and correcting their forms during the progress of their work, but also produced a greater variety of broken tints, which imitated more happily the deceptions of vision, and exhibited the appearance of all those little subordinate reflections and refractions which objects not perfectly smooth and even continually present to the eye. This advantage, however, it only retained in the works of the inventor and his immediate successors; while it furnished, to all the following generations of Italian painters, the means of painting without drawing, and thus contributed to sink them still deeper and deeper in that feeble, muddy opacity to which habits of imitation otherwise inclined them. Prior to the Caracci, indeed, the license of alteration seems to have been confined to mere corrections of detail, and never to have been extended, even in the minutest instance, to a change in the design or general composition, which, by accumulating strata of colours in the shadows, must necessarily render them muddy and opaque, as they frequently are in the works of the Bolognese school, and constantly in those of the Italian painters who succeeded to them, but never in those of Giorgione, Titian, Correggio, &c. These patriarchs of colouring knew too well the fatal consequences of changing their composition after the picture was begun not to digest and arrange it thoroughly in previous drawings, both of the parts and the whole; and the last is said frequently to have modelled his figures in clay before he painted them. By working, too, so much in fresco he had acquired an early habit of certainty and precision; so that a *pentimento*, which we have so often heard adduced as a proof of authenticity, is a most suspicious circumstance, and one of which we have never been able to discover a trace in any of the undoubted productions of his pencil. It is greatly to be lamented that Sir Joshua Reynolds, who was an enthusiastic admirer of him, did not proceed on the same principles, since, by continually altering his composition, he muddled his colours, and then attempted to render them clear, brilliant and mellow by vehicles of wax, varnish, &c., which destroyed them. If the old Venetian painters ever employed any such vehicles it was very sparingly, and only in the last glazing, with which they gave the general tone of harmony and effect to their pictures. This always vanishes with the original varnish under the hand of a cleaner, and therefore was probably applied in the same material. It may, indeed, be doubted whether Correggio ever practised, or even knew the Venetian mode, there not being, as far as we recollect, any known genuine work of him in which the substratum of body colour extends into the shadows. Rubens, like the rest of his countrymen, was educated in the original method; but both he and Vandyke, after studying the pictures at Venice, blended the two modes, or employed either, as transparency, brilliancy, richness and variety of tint were respectively aimed at. So likewise did Rembrandt, with a degree of skill and felicity peculiar to himself; but most of his countrymen adhered to the old practice, which is the cause of that clearness and truth that render the productions even of their inferior artists pleasing.

NOTES AND COMMENTS.

THE School of Handicraft in the East of London, which is under the honorary direction of Mr. C. R. ASHBEE, architect, has succeeded in surviving the three years' term which is fatal to so many infant associations. By rigid economy the school has not only paid its way, but has a balance on the right side of about 40*l.* More convenient premises have been occupied, and the director and committee propose to extend their operations by setting up a life class and an embroidery class, besides extending the courses in the existing classes. Among other undertakings contemplated are—(1) The training in workshop practice of young architects' assistants and pupils, especially such as work in the offices of East London firms; (2) the establishment of a special school of brazing and metalwork; (3) the revival of teaching in gold and silversmiths' work, with a view to accepting the offer made by a client of the guild, for the use by the guild and school, for artistic purposes, of one of the finest private collections of gems in England; (4) the development of the English leather industry in its decorative treatment, this being at present almost exclusively in the hands of the Germans; (5) the establishment of a guild and school press for the training of young printers; (6) the foundation of a university extension centre that shall have special bearing on the lines of handicraft conducted in the school, and thus bring the workmen and teachers of East London in direct contact with the old universities. But all this requires money, and so much good has been done already by them, that the director and committee have a claim on the generosity of all who believe in technical education of the best kind.

IRELAND, which has thirty-two counties, some of them having two divisions, possesses officers known as county surveyors, whose duties differ from those in the English shires. The majority of the Irish surveyors are competent civil engineers, and of late appointments are only given by competition. The emoluments are not extravagant. In first-class counties the salary is 600*l.* a year, in second-class 500*l.*, and in third-class 400*l.* The allowance for assistance is only 30*l.* a year. The county of Dublin is one of the smallest in the country, but owing to the number of roads that traverse it there are two surveyors. Prior to 1866 there were three surveyors, each with a salary of 350*l.* In 1866 the number was reduced. One of the surveyors is now seventy-three years old and receives 525*l.*, the other is a year younger and has a salary of 475*l.* The Grand Jury decided lately to recur to the original arrangements, that is to have three surveyors, but with salaries of 350*l.* each. In consequence the present holders of the office would be compelled to retire or to accept a very large diminution of income. Fortunately for them, it is necessary to obtain the approval of the Judicial Committee of the Privy Council before such changes take place. On Tuesday the application was considered at Dublin Castle, and the Lord Chancellor and judges, having a fellow-feeling for ancient officials, declined to recommend the Lord Lieutenant to approve of the proposed arrangements. For the present the two surveyors are safe.

THE Congress of Hygiene and Demography will begin at 3 P.M. on Monday next, in St. James's Hall, when the Prince of WALES will take the chair. The ordinary meetings of the sections will be held on Tuesday, Wednesday, Thursday and Friday. On Saturday there will be excursions, and the closing meeting will be held on Monday, August 17. It is announced that—"The aim of the Congress is to stimulate public interest in the progress of hygiene and demography, by which latter term is understood the study of the life conditions of communities from statistical points of view; and to afford persons interested in these subjects an opportunity of meeting, and of elucidating questions connected therewith by conference and debate." Section VI., "Architecture in Relation to Hygiene," will meet, under the presidency of Sir A. W. BLOMFIELD, in the West Examination Hall of the University of London, Burlington Gardens. The following papers are to be read:—Tuesday.—President's address. Open Spaces: The Earl of MEATH. The Hygienic Principles for the Extension and Internal Improvement of Towns: J. STÜBBEN, city architect of Cologne. The Hygiene of Groups of Dwellings at low Rental: CHARLES LUCAS, Paris. The Control of the Construction of Buildings: THOMAS BLASHILL, F.R.I.B.A. The Heating of Towns by Steam from Central Stations: S. M. BURROUGHS. Wednesday.—The Hygienic Composition of Walls of Dwelling-houses: EMILE TRÉLAT, Paris. Pile Foundations in Marshy Land, and the Exclusion of Damp from Dwellings: P. J. H. CUYPERS, Amsterdam. The Sanitation of Theatres: LENNOX BROWNE, F.R.C.S., Ed. Diagrams Illustrative of the Sanitation of Theatres: ERNEST TURNER. Some Insanitary Superstitions in House Building: H. H. STATHAM. Four-inch Drains *v.* Six-inch Drains: G. M. LAWFORD, C.E. Thursday.—The Principal Causes of the Unhealthiness of Workmen's Houses in Paris, and the Practical Remedies: EMILE CACHEUX, Paris. Common Lodging-houses: P. GORDON SMITH. Cottage Dwellings for the Industrial Classes: ROWLAND PLUMBE. Block Dwellings for the Industrial Classes: JOHN F. J. SYKES, M.B. Dr. KOCH'S new Institute: J. BÖTTGER, Berlin. Friday.—English Isolation Hospitals: R. THORNE THORNE, M.D. The Heathcote Hospital, Leamington: KEITH D. YOUNG. Temporary Local Isolation Hospitals as opposed to a Central Hospital: C. E. FEW, vicar of Seal. Hospital Tents and Huts: Dr. DUCHAUSOY. Asylum Arrangement and Construction: RICHARD GREENE, M.D., and G. T. HINE.

SOME months ago, when the sale of building materials and other objects took place at Arundel Castle, we called attention to a few of the lots which deserved to be purchased for museums. Among them were two remarkable figures in terra-cotta, each being about 10 feet in height. They were purchased by Mr. EDGLEY, who generously decided to present them to the parish of Lambeth. There is appropriateness in the gift, since the figures came from COADE'S pottery in Lambeth. They were probably modelled by JOHN BACON, R.A. Mr. MARK BEAUFOY, M.P., has undertaken the expense of erecting the statues in the garden of the Albert Embankment, opposite St. Thomas's Hospital, which is near the place of their production. The gift has been gladly accepted by the Lambeth Vestry.

A PETITION was presented to the French Chamber, but too late to be acted on this session, by a M. BERNARD, of Bordeaux, which has excited much interest among French painters. Of late years the prices paid for modern pictures in the Hôtel-Drouot indicate that property of the kind can become a most profitable investment; but, unfortunately, the creators of the property, or their representatives, cannot share in the profits. MILLET'S *Angelus* was not the only case where the artist was paid only a small fraction of the ultimate value of his picture. At the sale of the RŒDERER collection a pastel of the work for which MILLET received 3,000 francs—that is, more than he obtained for the oil-painting—was sold for 100,000 francs. THEODORE ROUSSEAU, the landscapist, sold his *Mare au Chêne* for 1,000 francs to M. RŒDERER, when the price obtained for it was 90,000 francs. A landscape for which DAUBIGNY received 2,500 francs realised 54,000 francs. Thus an outlay of 6,500 francs brought a profit of 237,500 francs; but not one franc went to the representatives of the artists. In 1848 CHARLES JACQUE was compelled to sell ten of his own paintings for 300 francs. For one of them 25,000 francs was paid in 1884, and there are signs that JACQUE'S works are likely to be appreciated by wealthy connoisseurs who can pay liberally for their hobbies. M. BERNARD in his petition implores the French Legislature to make arrangements to enable an artist, his heirs, executors and assigns, to obtain some participation in the good fortune which comes to early investors in his works. It is needless to say M. BERNARD'S efforts are Quixotic. He is evidently smitten with the copyright craze, which has made so many French artists fancy that all the world was ready to become impoverished to enrich the painters of bad pictures; but M. BERNARD wishes the enrichment to go on in perpetuity. He shuts his eyes to the probability of pictures for which big prices were paid becoming almost worthless in the market, although it is an everyday experience. Is he prepared to recommend that painters should in such cases make up the losses to the unlucky purchasers?

RESIDENCE AT BECCLES.

THIS house was recently erected upon the Grange Estate, from the designs of Mr. ARTHUR PELLS, F.S.I., architect and surveyor, Beccles, and contains three reception-rooms, eight bedrooms, dressing-room and bath-room. The brickwork is of red bricks laid in blue mortar, the roofs being covered with Broseley tiles.

ST. THOMAS'S CHURCH, TELFORD PARK, STREATHAM.

THIS church is proposed to be erected in Telford Park, for Archdeacon GIBBS, and some time ago a limited number of architects were invited to submit designs; but at present a commencement has not been made, as the committee do not feel justified in making a start with the funds they have in hand. The interior we illustrate to-day was that submitted by Mr. SPENCER W. GRANT, A.R.I.B.A., of 63 Finsbury Pavement, E.C., and Mr. SIDNEY R. J. SMITH, A.R.I.B.A., of York Buildings, Adelphi, whose design was selected. The church will consist of nave, transepts, aisles, chancel and baptistery and two vestries, and will be built externally of red brick and Bath stone, while the interior will consist of yellow malm bricks for facing, with Bath stone dressings and red Mansfield stone columns. Accommodation will be provided for 800 worshippers, the estimated cost without tower being 6,650*l.*

RESIDENCE, WAKE GREEN ROAD, MOSELEY, BIRMINGHAM.

THIS residence was recently erected for Mr. W. PERCY HARRISON by Mr. B. WHITEHOUSE, contractor, of Birmingham. The elevations are executed with red bricks and stone dressings, Bracknell rubber bricks being employed for the carved portions. The roofs are covered with brindled tiles. Messrs. ESSEX & NICOL, of Birmingham, were the architects.

BIRKENHEAD CORPORATION AND THE LOCAL ART SCHOOL.

A SPECIAL sub-committee of the Finance Committee of the Birkenhead Corporation have reported with regard to the transfer of the Birkenhead Schools of Science and Art to the Town Council. The report states that at an interview between members of the sub-committee and representatives of the School of Art, the matter was fully discussed, and the trustees were agreeable to the transfer, subject to certain conditions, among others:—(1) The trusts and provisions of the original trust-deed of 1871 to be observed and adhered to as far as possible, and especially as regards the maintenance and continuance of the principal building as a school of science and art; the property not to be sold except with the object of removing the school to some other site; neither the school nor its management to be handed over to the Department of Science and Art; (2) the title of the school to be enlarged so as to embody the name of the donor; it was also suggested that the school should be called "The Laird School of Science and Art"; (3) the committee of management to comprise some gentlemen not members of the Council, and when available a member of the family of the donor to be appointed on the committee; (4) the services of the present head master, who has been connected with the school since its formation, to be retained, at a fixed salary based on the average of his income from the science and art classes during the last ten years (say a salary of 566*l.* 16*s.* 11*d.*); suitable assistant masters to be provided; subordinate servants of long service to be retained; (5) the present trustees to be formally released by deed reciting the origin of the school; (6) all necessary legal and other expenses of and in connection with the transfer of the schools and the release of the trustees to be paid and borne by the Corporation. The land, buildings and furnishings to be handed over to the Council are valued at 7,966*l.*, and the invested stocks at 1,240*l.* In regard to these funds the trustees suggest that the present trust fund of 600*l.*, which is invested in a Birkenhead bond, should either be put on one side with the object of starting a museum or picture gallery, or remain invested and the interest applied annually to purchasing and adding to the present stock of examples, models, &c., or as a further alternative, appropriated in providing a prize fund. The present cost of carrying on the two schools amounts to about 1,000*l.* a year, but subscriptions, fees, &c., had nearly caused the accounts to balance. If the schools were transferred as proposed, subscriptions, &c., would cease, and the Council would have to find money to carry on the schools. For the year 1891 2,100*l.* had been received for technical education purposes, and it is suggested that for the present the Council retain this money. In concluding the report the sub-committee recommend, "That the Council should take over the existing Birkenhead School of Science and Art, together with its branch at Tranmere, and that all the necessary legal and other steps should be taken to effect such transfer; and that for the present and until some reliable estimate can be formed of the cost of carrying on the School of Science and Art, together with its branch at Tranmere, under the management of the Council or of the mixed Committee of Management to be hereafter established, it is inexpedient to make grants of money to any schools and institutions in the borough which have already made, or may hereafter make, application for aid." The Finance Committee will recommend the Council to approve and adopt the suggestions contained in the report.

MANCHESTER ARCHITECTS.

AN article in the *Manchester Guardian* lately contrasted the state of architecture in London, as shown by street improvements, with the neglect of the art in Liverpool and Manchester. The following questions were asked by the writer:—1. Why has there been no corresponding improvement in Manchester and Liverpool? 2. Is it that Manchester and Liverpool architects do not know what has been and is being done in London? 3. Or is it that they do not regard it as worth attending to? 4. Or, finally, is it the fault of the public, which will not have new ideas?

A "Manchester Architect" in reply says:—Are not the architects very much what the public make them? As Mrs. Poyser said when women were complained of—"They were made to match the men." It may, perhaps, be worth while roughly to classify or group the architects. Some few have powers of design, knowledge of architecture, ability in construction, the skill that comes from long experience, the taste that comes of natural cultivation of a natural gift, delight in the practice of their art; and these are men who would work at architecture for the work's sake. In others some of these qualities are altogether wanting, and those that remain are tempered by the conviction that to get work is of the first importance, and this damps all enthusiasm for architecture as an art. By a third group architecture is treated as a trade. To get work is the first thing, and to get paid for it is the highest good. There are some architects who have been carefully trained and taught, and who have studied their art at home and abroad. But there are others who have passed their three or four years' apprenticeship in a second or third-rate office, and who have very little general knowledge and almost no culture. There are others, again, such as builders' foremen, or clerks of works, or builders retired from business, or (as Lord Beaconsfield said) from whom business has retired, or office-boys promoted, who have picked up, as they think, the trick of how it is done, who pose as "practical" men, and who often get, from an ignorant and uncultivated public, no inconsiderable amount of work. Again, some buildings owe their conception to architectural pupils or assistants having the acquaintance of builders who have got "jobs" and want them put on paper. The architects of Manchester and Liverpool who properly deserve the title do know what is going on in London and elsewhere. That knowledge, however, nor even consummate knowledge of their art, does not necessarily bring them work to do. But the larger number of those referred to above, who write "architect" or "architect and surveyor" on their doors, probably do not keep themselves well informed of what is being done in London and elsewhere. So, in reply to question 3, those who do not know what is done elsewhere for the most part also do not care. But why should they care? If they are entrusted with buildings to carry out they are unlikely to believe that their offices would be fuller of clerks or their pockets of money if they spent their holidays in seeing what their abler and more cultured brethren have done in this generation or in past time. The answer to the fourth question is the simplest, and may well be the most emphatic. The chief reason why the architecture of Manchester has not improved is that the public are so little able to discriminate between what is really good and what is inferior or bad that the best and ablest architects are not duly encouraged. In the eyes of many persons a mass of stonework is a "handsome" building, even

though it be also a mass of crudities. Some, again, see beauty in fantastic abortions which have been happily named "acrobatic architecture." But commonplace people, to whom commonplace buildings appeal most, are so vastly in the majority that commonplace architects (and worse) have a wide pasture whereon to graze. Many buildings of the warehouse, office and shop class are got up by architects more or less as speculations. Some (so-called) architects spend most of their time and the best of their energies in getting hold of work to do. They watch sites, or they get sites into their own hands in such a way that it is difficult for anyone to build on the land in question unless this man is employed. He may be an architect of a low or of the lowest grade, but the situation may be to the client of more importance than the building. Much miserable building of poverty-stricken design is to be accounted for in this way. Unless it happens that an able professional assessor is appointed, it is most often the case that in architectural competitions the best design does not stand the best chance of being adopted. Very few committees or other such bodies have the necessary knowledge, taste and judgment to enable them to choose the best. It not unfrequently happens, particularly in this district, that the more a man knows the less chance he has of a design embodying his knowledge being adopted. The assumption of superior knowledge which such a design implies is in a way resented by the not well-informed judges. It is believed that many appointments of architects to buildings about to be erected are made in consequence of direct or indirect commissions paid to those who influence the appointment. If this be so, other considerations than proved ability or special qualifications on the part of the architect will prevail. Another cause—but this is chiefly in house-building—is the offers made by tradesmen of the class of decorators and others "to save" gentlemen—and still more ladies—"all trouble" by designing and building the house and furnishing it "all complete." Even an ironmonger in a large way of business told me he had an order for a large and costly house for a customer, and that he had undertaken to design and build and furnish it complete for habitation at his own price. At the very best such houses look like manufacturers' architecture. They exhibit ignorance of architectural style, inconvenience of plan and arrangement, and, though apt to be overloaded with ornament, possess no inherent right to rank at all as architecture. Many of these reasons brought forward to account for the poverty of design and the want of improvement in architecture are no doubt of equal force elsewhere. But in the comparison between Manchester and London it has to be remembered that a very large part of what is now called London is residential, while no part of Manchester proper can be so called, and in the immediate suburbs in or out of the borough there are very few new houses excepting those run up as building speculations, and the name of these is legion. To quote again from the article in the "Edinburgh" to which you refer:—"This is architecture built purely for the sake of percentage returns, nor can there be any change for the better until the public learn to recognise and to demand good architecture in our streets as something worth having and waiting for."

WINTOUN HOUSE.*

WINTOUN HOUSE is situated about twelve miles eastwards from Edinburgh, and about one mile from Pencaitland. The long unbroken southern front of the building stands on the edge of a steep bank, sloping down to the valley of the river Tyne; on all other sides the surrounding ground is level, and laid out as parks and policies. During this century extensive additions have been made to the house along the north and west sides. Fortunately these additions are not high, as otherwise the best parts of one of our finest seventeenth-century mansions would have been blotted out, as it is on the north front that the architect of the house has exerted his utmost skill. The south front is very plain, the reason of this being that the existing house is an enlargement of an earlier building which was a comparatively plain structure. At a later time the north and east fronts, and parts of the west front, were enriched and added to; while the south front, although heightened, was otherwise left in very much its original condition. The evidence of the staircase towers and the ornamental windows and chimney stacks of the north and east fronts being insertions and additions to an existing house is very obvious.

The late Mr. David Rhind, architect, in the "Transactions of the Architectural Institute of Scotland," 1851-52, expresses an opinion that the house stood unfinished for some time at the height of two storeys, and that when it was resumed it was continued in a more elaborate manner. Whether the view be adopted of the house having stood unfinished, or having been finished and afterwards altered, the fact of a change of style equally remains. The main portion of the house is an oblong, measuring about 79 feet long from east to west by about 31 feet in width, with a wing at the north-east corner about 25 feet square, having a turret staircase in the re-entering angle. These portions appear to have formed the original house, which was thus constructed on the old L plan. In connection with the later extensions there was added, at the north-west angle, a large staircase tower about 17 feet square, thus converting the plan into a shape similar to that of Castle Stewart and Pitreavie. The staircase in this tower ceases at the first floor level, and is continued in an angle turret, the tower itself becoming available for bedrooms. The wall of the south front extended westwards of the west gable. The building is three storeys high towards the north, but owing to the slope of the ground to the south an additional basement storey is gained in the main block, in which are situated the kitchen and offices entering from the south and communicating with the first floor by a private stair.

The principal entrance doorway was probably in the large staircase tower of the north-west angle. The staircase led on the first floor into the present drawing-room, which was then the hall. The room to the east of this, now called King Charles's room (which has access by a separate staircase) was probably the drawing-room, and the room to the north of it the owner's private room. The upper floors consist of bedrooms entering off a passage or corridor running along the north side. These have been modernised, but the old panelled plaster ceilings are in many cases preserved. Most of the interior, with the exception of the drawing-room and King Charles's room, has also been modernised. The interior of these apartments, with their fine plaster ceilings and ornamental fireplaces, are characteristic of the time of James I. It is interesting to note that the ornaments used in the plasterwork of Wintoun are identical in many instances with those of Pinkie House and Moray House. This indicates that the same plasterers were in all probability employed on all these houses, and that then, as now, it was found much easier and cheaper to copy the enrichments already made than to design new ones. In the drawing-room fireplace the figure-subjects on the inner panels are of wood and modern, the whole space having originally been an open fireplace.

From Maitland's "History of the House of Seyton," we find that Wintoun was built by George, tenth Lord Seton and third Earl of Wintoun:—"He built the house of Wintone (being burnt by the English of old and the policy thereof destroyed) in anno 1620. He founded and built the great house from the foundation, with all the large stone dykes about the precinct, part, orchard, and gardens thereof." According to Nisbet, he was the second Earl of Wintoun, and died in 1650; while David Laing styles him the sixth Earl.

In the "Transactions of the Architectural Institute of Scotland," 1851-52, the late David Laing has stated that, whilst examining various records, he accidentally met with a notice which seemed to leave no doubt that Wintoun House was designed and built by William Wallace, who then held the office of King's Master Mason for Scotland. Wallace was the first builder of Heriot's Hospital, and, in Mr. Laing's opinion, architect as well. Dr. Balcanquall, Dean of Rochester, who was executor to George Heriot, has been put forward as having been the architect of the hospital, which claim Mr. Laing disproves, and goes on to say:—"The house of Wintoun, in the parish of Tranent, may have contributed, through the recommendation of Mr. Robert Balcanquall, then minister of that parish, to his brother Dr. Balcanquall, along with his established character, and the personal knowledge of his fellow-citizens in Edinburgh, to his being employed in the erection of the new hospital." The hospital was begun in 1628.

Wallace, of whom only a few facts have been gleaned by Dr. Laing, was admitted a burgess of Edinburgh in 1621. He was deacon of the Freemasons' Lodge there, and was employed for repairs on Edinburgh Castle and Holyrood Palace, and for "his guid, trew and thankfull service" done there, he was appointed Master Mason to the King in 1617. He died unexpectedly in October 1631.

The following seems to be the notice which Dr. Laing founds his conclusion on as to Wallace having designed Wintoun House. It is from the "Register of Confirmed Testaments," December 12, 1632, regarding an allowance granted to him for special services to the Earl of Wintoun:—"Item: Thair was awin to the said umquhill William Wallace be George Earle of Wintoun, in acknowledgement of his panes in his lordship's works, conforme to his lordship's tiket, subscrivit with his hand, the sowme of 500 merkis, quhilk sowme of 500 merkis is upliftit sen the Defunctis deceas be Nicoll Adwart, baillie, and as yit is in his handis and custodie. Item: Be his Majistie's Thesaurer for the Defunctis fees as Master Massone to his Majistie, and for his leveray clothes due, to be pait be his Majisties Thesaurer ond Ressareris, the last of October 1631, 330 merkis."

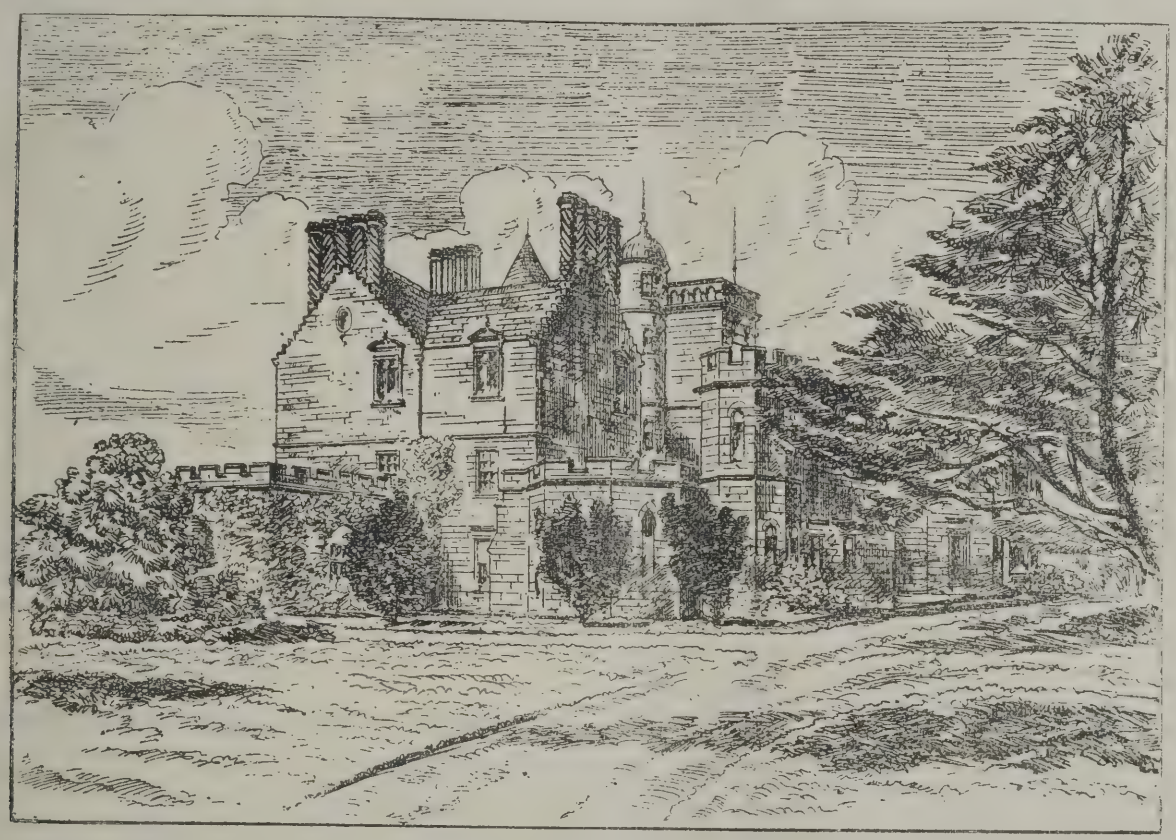
While the above does not prove Wallace to have been the

* A paper by Mr. Thomas Ross, published in the *Transactions of the Edinburgh Architectural Association.*

designer of Wintoun House, it may be held as conclusive evidence that he was either the architect or the builder, and from the date we see that it must have been in connection with the enlarging and enriching of the house, to which we have already referred, that he was employed. That he was a man skilled in architecture may be inferred from what we know about him in connection with Heriot's Hospital. Thus his receipt to the treasurer in August 1629, for 100*l.* awarded to him by order of the Governors, bears that it was "for my *bygone panes and extraordinarie service in the Frame* and building of the said Hospitall this year bygone."

And again his widow, in an application to the Governors for relief after her husband's death, "being left with ane great burding of many young small babies," says:—"It is not unknown to your lordships what extraordinair pains and cair my said umquhile spouse had and tuik upon the said wark thir diverse years bygone, and at the beginning thairof." This was acknowledged by the Governors, who gave her 200 merks, "with the soume contenit in hir compt, and to ressave frae hir the haill muildis and drauchtis the said umquhile William haid in his handis."

All this seems to show that Wallace was something more than the builder of Heriot's—that he was, in short, the architect; and if his title to be so considered is clear in the case of such an important building, which Mr. Laing considered it to be, we may without hesitation assume that it was as the architect and builder of the ornamental part of Wintoun that the earl acknowledges Wallace's "panes on his lordship's warks."



We may call attention to the manner of slating adopted in the curved roof of the "Wallace Tower," the slates being cut into patterns in a very unusual manner. There is a high terrace wall continued eastwards from the house, a few feet in advance of the south front, ornamented on the top with an open arcaded parapet, of the same design as that round the top of the "square tower," and otherwise the wall is ornamented on the face with coats of arms, &c. Stairs descend from the terrace to the lower grounds, and there are indications that the ornamental pleasure-grounds were at one time of considerable extent.

It is unfortunate that so little is known of Wallace, the architect, and where he studied his art, as a clue might thus have been obtained to the place whence the Scottish Renaissance chiefly came. Although the general character of Wintoun House is Scottish, there are many features in the design of this building (as well as in Heriot's Hospital) which forcibly recall the style adopted in England in the times of Elizabeth and James. The tall stone chimneys, ornamented with spirals and other enrichments, and the cornice and parapet of the square tower are strikingly English in feeling, while the octagonal angle turret and windows, with entablatures surmounted with interlacing scrollwork, have rather more of a Scottish character. Had this building stood alone, there is perhaps enough of English feeling in the design to justify its being attributed to an English architect. Hence, perhaps, the motive which has sometimes inclined people to assign this mansion, together with Heriot's Hospital, Drumlanrig, and every other building in Scotland in which the Renaissance style predominates over the Scottish, to Inigo Jones as a well-known and representative foreigner.

But when we examine other Scottish designs, and consider how the various features which are here met with in a completed form, were gradually and slowly introduced, we feel convinced that these features simply indicate the change of style which was then penetrating Scottish architecture, as the revival was affecting every other branch of human activity.

Many features of English architecture were introduced into Scotland about this period. Thus, at Leslie Castle, Kellie Castle and elsewhere, we have detached stone chimneys, set diagonally. At Moray House the detached chimneys are very tall, and stand on a pedestal, like those of Wintoun. At Craiginvar Castle, Fraser, Duntarvie, &c., instances occur of towers with flat roofs, provided with parapets and balustrades; at Innes House the chimneys are detached and the tower is square, and is covered with a parapet of unusual design; while at Heriot's Hospital a Renaissance style is introduced, in which few traces of the old Scottish remain, and which savours rather of Germany than of England.

The Rev. James Coullie, B.D., supplemented the above description in the following words:—

On the ceiling of the small dining-room there are the royal arms and the letters C. R. (Carolus Rex), and tradition has it that Charles I. on one occasion slept there. In the wall of the upper terrace is to be seen an elaborate stone panel containing the royal arms, and the words, "James I., King of Britain, France and Ireland." This panel is said to have been over the former entrance to the castle, and to have been placed in its present position for safety when the additions were made about the middle of last century. To the old house of Wintoun, Queen Mary is said to have been a frequent visitor. We remember that Mary Seton was one of the "four Maries." There used to be an old bedstead preserved in the attics called Queen Mary's bed. The estate of Wintoun was forfeited in 1715, when George, fifth and last Earl of Wintoun, was outlawed for his attachment to the house of Stuart. He was taken prisoner at Preston in Lancashire, tried for high treason, and sent to the Tower to await his execution. He effected his escape and fled to Italy. He died in Rome, aged 70. The York Buildings Company, a company formed for the purpose of buying up and again selling confiscated estates, bought Wintoun and sold it to Hamilton of Pencaitland. Thus the two adjoining properties became one, and Wintoun Castle the manor-house of the combined estates. Colonel Hamilton enlarged the house, adding to it the present large dining-room, ante drawing-room and front hall, changing the entrance from its former position near where the kitchen door now is. It was in his time that the present approach was made, and the high road thrown

back from the centre of the park to where it now runs. Traces of the old road are still to be seen near Pencaitland Cottage, and the trees in the field near old Wintoun toll-house mark its course. It was Lord and Lady Ruthven who built the present terraces, and abolished the old village of Wintoun, which stood in the centre of the park not far from the garden wall. It is said that Sir Walter Scott took Wintoun as his model for Ravenswood in the "Bride of Lammermoor." Not far from the west end of the present terraces there stood a mill. Traces may still be seen of the old mill lade by the side of the meadows. It was Colonel Hamilton who gave the Tyne its present straight course through the haugh between Wintoun and the bridge near the church. On the south side of the Tyne near the iron bridge, and where the clump of trees now stands, was the village of Pirnie. The Session Records speak of Pirn Castle, where some poor people lived, and the place is still known as the Pirnie Braes. At Loanfoot, where the keeper's house at present stands, there was once a group of houses, and away over near Wintoun Station stood the farm-steading of North Mains of Wintoun now absorbed in Wintoun Hill. A solitary tree in the middle of the field marks the site. There used to be near the church an interesting building known as the "College." Some say the name is taken from Colleague's house, and that it was, in fact, the old vicarage in which two priests lived. But all trace of it was swept away in 1856, when the churchyard was extended. The old part of the churchyard must be very old, but we have no tombstones with dates older than within thirty years of the beginning of the seventeenth century.

SANITARY ADMINISTRATION.

AT the meeting of the British Medical Association at Bournemouth an address on the evolution of local sanitary administration was delivered by Dr. Edward Seaton, lecturer on public health at St. Thomas's Hospital and medical officer of health for the administrative county of Surrey. After briefly sketching the rudimentary condition of sanitary administration before the passing of the Public Health Act in 1872, he described the effect of that Act in extending the sphere of medical and scientific influence in sanitary administration. That influence had been of incalculable advantage to the public health. Under the Act of 1872 certain large towns, notably in the North and in the Midlands, had appointed medical officers of health of a kind altogether different from the occasional sanitary referees who had preceded them. The health officers of the new creation were skilled advisers, whose chief function it was to exercise a continuous pressure on the authorities whom they served in all matters pertaining to the health of the community. The most important result of that influence was seen in the local Acts defining the conditions under which new buildings could be erected which had been obtained by several large towns between 1873 and 1878. These Acts not only improved the health of the towns to which they related, but led to the promulgation of the complete "Model By-laws of the Local Government Board," which were now being adopted throughout the country. With the view of giving effect to these regulations, some "pioneer" corporations had appointed a special building-surveyor, who should be responsible jointly with the medical officer of health for the enforcement of the by-laws. An illustration at once of the far-reaching effect of local legislation and of the influence of medical advice on local authorities was afforded by the notification of the Infectious Diseases Act, which was first introduced by the Town Council of Bolton, in Lancashire, in 1877. The great advantage of notification was that it enabled sanitary authorities to combat the actual, as well as the potential, causes of disease; for instance, by tracing an outbreak of infectious disease to a particular water supply. The public have not yet learned the lesson that different diseases require to be controlled by different methods. They are still under the dominion of what Carlyle would have called a "formula," to the effect that the cause of all disease is dirt, and that sanitary salvation is only to be found in well-flushed drains. The danger of this simple creed is that when the faith which has been pinned on cleanliness as an universal safeguard is shaken by the discovery that there are diseases which a system of drainage is powerless to prevent, sanitary science as a whole may be unjustly discredited, and runs the risk of being treated as the savage treats the fetish which has failed to produce the desired effect. The chief value of the notification of diseases is that it enables sanitary authorities, basing their action on medical and scientific knowledge, to wage war against the actual causes of the mischief in any given case (such as a water supply, a milk supply, a school, &c.), instead of wasting their energies in twirling the sanitary mop among potential causes. Notification is only a means to an end; and can only be useful when the immediate causes of the diseases notified are accurately known and amenable to control; but it could not produce any very remarkable results in checking the spread of such diseases unless it were complemented by the provision of an efficient sanitary staff and of adequate means of isolation in special hospitals together with disinfection. The former of these requirements was a matter of administrative policy which was hardly yet ripe for discussion. With regard to hospital accommodation for cases of infectious disease, the needs of a large town and the way in which they might be met were exemplified by the work of the Metropolitan Asylums Board. A sketch was given of the origin of that Board and of its development into a central authority for the hospitalisation of cases of infectious disease in London. The total provision made by the Metropolitan Asylums Board was not far short of one bed to every 1,000 of the population, which was the standard of requirement for public health purposes. The excellent example set by the Board in this respect had already been followed by several large towns, and before long no town of importance would be without the means of isolating cases of infectious disease. On the other hand, the Metropolitan Asylums Board had taken a lesson from sanitary authorities by throwing the isolation hospitals open to all patients, whether pauper or not, without payment. The position of the Board had, however, been greatly changed by the Local Government Act. The county councils formed by that Act were intended to be the chief sanitary authorities of counties in the future; they already had control of the lunatic asylums, and it would simplify sanitary administration if the control of the isolation hospitals were also relegated to them. A special reason for the transference of this responsibility in London from the Metropolitan Asylums Board to the County Council existed in the fact that the latter body had a responsible medical adviser of its own, while the former had to depend on casual and irresponsible counsel. On the whole, the Metropolitan Asylums Board, having done the work which it was created to do, had no longer any sufficient *raison d'être*. In county sanitary administration it would be advantageous if the county councils were immediately to undertake the functions of central sanitary authorities. As far as isolation hospitals were concerned, the present system was an administrative chaos. Owing to division of authority, hospitals with every provision for the isolation and treatment of infectious diseases might stand empty while epidemics were rising almost at their very doors, but outside the administrative districts to which they belonged. With regard to the future of sanitary administration, further evolution should be in the direction of greater simplicity in organisation and a nearer approach to uniformity in the size of sanitary districts and in the methods of administration than was now the case. The question of "whole service" must be considered in connection with that of the formation of administrative areas large enough to provide sufficient work and adequate remuneration for the medical officer of health. While deprecating cut-and-dry systems of administration and excessive centralisation, Dr. Seaton thought the present freedom of local authorities from all control was apt to degenerate into administrative license, with serious results to the community at large.

ST. GILES'S CATHEDRAL, EDINBURGH.

THE work of constructing the Chambers Memorial Chapel in St. Giles's Cathedral has now, says the *Scotsman*, reached an advanced stage in its completion. The chapel has been formed out of a building which was erected against the north-east side of the transept probably a short time after the Reformation. It has been used in the course of its history for a great variety of purposes—at one period, it is believed, as municipal offices—and had continued to be utilised as a sort of vestry down to the time when it was resolved to convert it into a chapel to the memory of the man who has done so much for St. Giles's. This building has now been opened up and thrown into the cathedral by a wide Gothic arch rising into the vaulting of the north aisle. The handsome groined stone ceiling—which the committee decided to introduce in order to adhere to the best traditions of the ancient edifice—springs from the four corners of the chapel and meets in the centre, with massive ribs, in a very fine ancient carved boss, belonging to some portion of the old church of St. Giles's, on which is represented the emblem of one of the evangelists. Corner columns with carved and moulded capitals in the style of the ancient work of St. Giles's support the ceiling. In the course of the construction of this chapel the removal of the plaster which covered the old east wall of the transept revealed some remains of moulded work, and their attention being drawn to it the committee decided to have a thorough examination made. They were rewarded by discovering the remains of a very fine Gothic window, sadly mutilated and broken certainly, but still sufficiently perfect to enable the architects to arrive at a fairly accurate idea of its original character. During the alterations at the beginning of this century the north transept was greatly changed. All the other walls were taken down with the exception of the one referred to, on which is now found the springing of the ribs of

the groined ceiling of the old transept. This, along with the window, is the only piece of ancient masonry now remaining in St. Giles's which has not been tooled over in modern times. The window is very much in the style of those at the east end of Melrose Abbey, being divided in the height with a transom supported on cusped arches, and having small battlemented ornaments along the top, after the style of the Perpendicular Gothic. The jambs of the window have rich mouldings, with carved capitals at the springing of the arches. On the inside the window must have been one of excessive richness. On its two sides there are the mutilated remains of elaborate canopies, evidently intended to contain statues—a circumstance which has led to the supposition that an altar had previously stood beneath. No part of the tracery of the window was found, although diligent search was made; and the committee, after giving the matter careful consideration, came to the conclusion that the restoration should be after some decided Scottish example. That selected, as the most characteristic, was one of the windows of Dunkeld Cathedral, the tracery of which was found to harmonise admirably with the other details. In pursuing this work of restoration a little further there was discovered above the window, on the outside, the remains of the carved cornice that ran beneath the parapet. It was enriched at intervals with carved corbels, two of which in a very fine state of preservation were secured, and have now been built into the archway leading to the chapel from the aisle of the cathedral, where they can be well seen. A good many loose stones with carving were also found, one of the most interesting being a Norman capital. It is well known that there was a Norman porch at one time on the north side of the cathedral, unfortunately taken down about the end of last century. A careful drawing of it, however, which was made and can be found in Sir Daniel Wilson's book, reveals the fact that the capital found during the excavations clearly did not belong to this doorway. It is of quite a different, probably an earlier type, and furnishes conclusive evidence that a church stood on the site in the twelfth, or certainly early in the thirteenth century. Another find, it will be remembered, was the arm bone, which caused a good deal of controversy, and was for a time supposed to be the arm bone of St. Giles. The construction of the chapel has been the means of greatly improving the cathedral, what used to be an exceedingly dark part of the interior being now admirably lighted. The committee hope to be able in the course of a few months to complete the work they have so happily begun. It is proposed to introduce two stained-glass windows into the chapel—one of which will be to the memory of Dr. Chambers, the restorer of the cathedral—and a brass tablet setting forth the history of the renovation. The architects for the work are Messrs. M'Gibbon & Ross, Frederick Street, Edinburgh.

EXCAVATIONS AT AYR.

THE following description in connection with the excavation of the church of St. John the Baptist at Ayr is contributed to the *Scotsman* by a correspondent :—

At the instance of the Ayrshire and Wigtownshire Archæological Association, a series of excavations is at present being conducted in the immediate vicinity of the tower that in olden days formed part of the church of St. John the Baptist, the parish church of Ayr. As far back as 1726, or about that year, the walls of the church proper were demolished to build, or to complete the building of, the steeple of the Tolbooth, which, after standing for almost exactly a century, was itself removed to make way for the march of public improvement. Since that time the blowing sand, accumulations of rubbish and finally the greensward, have combined to shut out the ruins from sight; but now, by the labour of the excavators, the long-buried remains are being gradually exposed, and in a week or two at the furthest the archæologists will have the satisfaction of knowing exactly the site occupied by a building which, in its time, played no inconsequential part in the national history.

Happily, St. John's was perpetuated by Slezer; and his view, taken in 1693, was available as an index to the searchers. In proof of the accuracy of the engraving, the foundations were discovered on the very first attempt, and the excavators have since been rewarded by the finding of the floor of the church and by the unearthing of a stone coffin in an excellent state of preservation. Other remains, in the shape of carved stones, &c., have also been brought to light; and it is highly probable that when the ground comes to be thoroughly searched at a further distance from the walls of the church, even more interesting relics may be disinterred. The workmen employed in 1726 in demolishing the edifice have made a clean sweep of everything adjacent to the walls. The lid, for instance, had been removed from the stone coffin and the contents dissipated. Their vandalism stopped short there, however, to all appearances, and close by the workmen of to-day have come upon immense quantities of human remains. The dead do not seem, save in the solitary exception of the stone chest, to have been provided with coffins. In some instances they were buried with their faces downwards; in others lying on their side; in no case has a skeleton been found on its back. Of course the utmost care has been taken of these remains, and where it has been necessary to disturb them they have been reinterred as close by their original place of sepulchre as was possible. In one instance, the skeleton of a man was found lying beneath the foundation-wall. It is hardly conceivable that he could have been so "eirded" after St. John's was built; and the inference seems irresistible that he must have been buried about the close of the twelfth century. So far as can be ascertained, no interments have taken place in the churchyard since 1654—the year in which the existing old church of Ayr was built—and it is worth noting that not in one single instance has a decayed tooth been found. The burghers of the centuries between the twelfth and seventeenth do not, therefore, seem to have been cursed with toothache.

When St. John's was built there is no means of knowing. William the Lion made Ayr a royal burgh in 1198 or 1200. Eight or ten years previous he erected a castle on the banks of the river, and it was from this "novum castellum" that he dated the charter. St. John's may have been founded at the same time, if it was not, indeed, already in existence. In 1224, according to the chartularies of Paisley, the master of the school of Ayr acted in a cause as judicatory, on a mandate from the Pope; and it may be assumed that the kirk was in existence, and a well-recognised centre of ecclesiastical influence, at at least as early a date as the school. But it is not till 1233 that the church itself appears on record. In that year a dispute arose between the monks of Paisley and Gilbert, the son of Samuel of Renfrew, when an examination of witnesses took place in the parochial church of Ayr; and between that year and 1292 there are three ecclesiastical references to St. John's. In 1324 or 1325, William de Lyndesey built a chapel, which he dedicated to the Holy Trinity. Lyndesey was Chamberlain of Scotland during a long period of the reign of Robert I. One of his successors, David Levingston, was Keeper of the Privy Seal under James III. from February 1482-83 till 1488; and another, Andrew Lockhart, became Treasurer of Scotland in 1530. In addition to the rector—afterwards, when Ayr was established a prebend of Glasgow, the curate—there were a number of chaplains, who officiated at the different altars; and, according to the records of the burgh, there were several choristers or singing boys, with an organist at their head, who played on the organs, sang in the choir, and taught a singing school in the town. St. John's had four principal altars, dedicated respectively to the Holy Trinity, to the Holy Cross, to the Holy Blood, and to the Virgin Mary. Other altars were dedicated to St. Michael, to St. Nicholas, to St. Peter, and to St. Ninian; and the conveners of the trades of Ayr founded an altar in honour of St. Anna, St. Eloy, and other saints, the patrons of the different trades. James IV. made numerous offerings in St. John's; and when at Ayr, in September 1497, his treasurer gave twenty shillings to the priests to say "a trentale of masses of St. John" for the king.

The tower of the kirk, which still stands intact and entire, was growing grey ere the Auld Brig was thrown across the rushing river. It may have seen a century go by—and it must have seen half a century at least—ere King Haco sailed up the Firth of Clyde, in 1263, to be crushed by the Scots on the shore of Largs. It looked across a few hundred yards to the castle of Ayr, where the flag of England flew, when as yet the spirit of Sir William Wallace had only begun to move in the camp of the people. Its walls must have reflected the glare that shone in the night sky when the patriot fired the barns and consumed the English soldiery in the fierce hecatomb. From the summit of the tower the friars may have watched the English army of revenge storm the castle, and, after holding it for a few months, effect their escape in haste when Wallace had swept the remainder of the westland clear of the enemy. Robert the Bruce came to the castle and set fire to it, in pursuance of his policy to leave no vantage ground for the Southrons; but the flames died out, and when the changing fortunes brought back the English, Ralph de Morthemer found refuge in it, and held it till Bannockburn had been fought and won. Sabbath, April 26, 1315, was a day of days in St. John's. Across the sandy knowes and from the causewayed streets of the town of Ayr marched a goodly gathering of nobles and of barons who had fought at Bannockburn, and with high pomp and ceremony they met in the church, declared their allegiance to Robert the Bruce in Parliament assembled, and decreed that, in the event of the king dying without male issue, his brother Edward should succeed him. A notable spot for such a scene; for, to the south, and beneath the ken of the tower, lie the broad lands of Carrick, of which the Bruce was Earl. Twice more, however, the friars saw the English soldiery come and go; and then there ensued a long period of comparative quiet. In 1533 the doctrines of the Reformation found militant adherents in Ayrshire, and one of these, Walter Stewart, brother to the lord of Ochiltree, gave practical demon-

stration of his zeal by casting down to the floor one of the images of St. John's. For this act he was called to account by the Bishop of Glasgow, who, after long dealings with him, persuaded him to recant his faith. But neither his recantation nor his life was of long continuance. On his way home he fell from the back of his horse into a stream and was drowned; but before the waters finally swept him away he exhorted his friends to take warning by his impending fate, protested he was there to die in the new faith, and that, sorry for his recantation in presence of the bishop, he was assured of the mercy of God in Christ. Finally, he bade them remember this judgment on him to their profit, and then letting go the stone to which he was clinging, he was drowned. The Reformation came on all the same, though the friars no doubt regarded Stewart's fate in the light of a judgment. The old Catholic fathers fled the scene, and the Presbyterians laid hold of the parish kirk and made it their own. Knox came to the westland and roused and quickened the reforming zeal of the burghers from the pulpit of St. John's; and later on, in 1602, and from that till 1605, when he was driven out, the minister was Knox's famous son-in-law, John Welsh. Then the Bishops had their turn, and then again the Presbyterians, till Oliver Cromwell appeared and turned the church into a shelter for his troops. By way of compensation, he gave the burghers a thousand merks Scots; and with this donation they built another kirk in the Friars' Yards, on the banks of the river Ayr. Around St. John's, Cromwell built a fort, and the greater part of it remains till this day.

In the archives of the town of Ayr is preserved the Obit Book of the church of St. John, the only MS. remain of the building. It is beautifully written in black letter on vellum, and consists of twenty-four leaves quarto, strongly bound together. The entries commence in 1306, the year in which Robert the Bruce assumed the sovereignty of Scotland, and close in 1595, thirty-five years after the Reformation of 1560, a fact which seems to indicate that the professors of the old faith were permitted to continue to some extent in the exercise of their offices. The testators whose obits are recorded in this interesting volume took care that the priests should not neglect their duty. Sir Andrew M'Cormyll, vicar of Stratone, "who died the 3rd day of the month of April, the year of our Lord 1507," enacted, "From those absent from these obsequies, and those absent from the whole mass, fourpence to be withdrawn; to the absentees from both, nothing shall be given. And that six priests at least be present at the obsequies after this mode; and because that delay brings danger, I wish that threepence be withdrawn from each present and not performing on the day of the obit." There are many similar reservations. And the same spirit seems to have obtained in the magistracy of the borough, who enacted in 1543, "And in likewise commands and charges all others, the chaplains having chaplainries within the parish kirk of Ayr, to persevere in their good and thankful service to the honour of God, and behave them thankfully for the good and common weal of the town, certifying them, an they be overtaken with any high displeasure against the good town, their benefice shall be taken from them and disponit to another more qualified therefor."

From the days of the Commonwealth St. John's has had no history. The tower was long used by the burgesses in order to watch their incoming and outgoing ships; but, as has been said, church, graveyard and all have disappeared, and remained perdu until the nineteenth-century daylight was let in upon them by the spades of the excavators.

CONSTRUCTION OF THE MANCHESTER SHIP CANAL.

At the annual meeting of the Institution of Mechanical Engineers of Liverpool, Mr. E. Leader Williams read a paper on "The Mechanical Appliances Employed in the Construction of the Manchester Ship Canal." He said that the mechanical appliances used in its construction were on the largest scale in order to minimise the employment of labour. The number of men and boys employed on the canal had never exceeded 17,000, and about 200 horses had been used. As the excavation amounted to 46½ million cubic yards, of which over ten millions were sandstone rock, any available number of men and horses would be insufficient to do the work in any reasonable time. Ninety-seven steam excavators and eight steam dredgers of large power had, therefore, been employed. The soil excavated had in most cases to be taken several miles to the spoil grounds, the position of which had necessarily been selected where land was moderate in price. For this work, and for the general purpose of construction, 173 locomotives and 6,300 trucks and waggons had been used. A railway had been laid along the whole course of the canal, in many places on both sides, with numerous sidings. These lines, with those laid in the bed of the canal for excavating purposes, amounted to a length of 228 miles of single lines. Flat-bottomed steel rails, 56 lbs. to the yard, with fish joints, were laid on ordinary cross-timber sleepers, and the cost was about 630*l.* per mile of single line. The railway and its rolling-stock were on a larger scale than some of the passenger and goods lines worked in this country or on the continent. The rate of excavation had varied from three-quarters of a million to one and a quarter million cubic yards per month. As the work proceeded and the cuttings became deeper and the inclines steeper, and as the sandstone rock required blasting before the excavators could remove it, the rate of excavation in the bottom of the canal was slower. The waggons are hauled out of the bottom of the cuttings by locomotive power, the gradients adopted being generally 1 in 30. Steam cranes were largely used in rock cuttings and for setting the masonry. There were employed on the works 124 steam cranes, 192 portable and other steam engines, and 212 steam pumps of various sizes, some being large Cornish pumps that had been brought from the Severn Tunnel works. The plant used consumed about 10,000 tons of coal per month. The greater part of the plant was specially constructed for the work, and the remainder was principally brought from Mr. Walker's contracts at the Severn Tunnel and Preston and Barry Dock works. The total cost amounted to 943,610*l.* The whole plant, huts, &c., were the property of the Ship Canal Company. No less than fifty-eight of the Ruston and Proctor's steam navvies were used, that being the largest number ever employed on any work. Its power in removing hard material was greater than that of any other machine yet constructed. Soft sandstone rock was removed by it without blasting. The buckets for the sand excavation on the canal had been increased in size to hold 2¼ cubic yards, so that two buckets were sufficient to fill a large earth-waggon holding 4½ cubic yards. The advantage of this excavator being self-propelled was considerable, but its weight was great, and on very soft ground it required heavy timbers under the rails. It should be put to work if possible with a high feed, 12 feet to 15 feet, according to the nature of the soil. It would clear its own road, and also that required for the line of earth-waggons. The cost was about 1,200*l.*, and with this machine about 2,000 cubic yards had been excavated in one day of ten hours in good material. A fair average, however, would be 600 to 700 cubic yards. The working expenses of a steam navvy may be put at about 30*s.* per day. Its disadvantages are that its capability is limited to cutting its way forwards only, and that its great weight has sometimes caused its disuse on the canal works where the ground has been very soft; no ordinary system of rails and sleepers is sufficient to carry the navvy on very soft ground. The fact that these steam navvies could work in hard material was a great advantage, and they had been used in cuttings where no other excavating machine would work. The Wilson steam excavator was of the same type as the Ruston, and had done good work on the canal, its average being about 600 cubic yards per day of ten hours. The cost was about 1,050*l.*, and the working expenses 25*s.* per day. The Priestman and other grabs had been used, principally for excavating foundations and other similar work; in suitable soil it had been found to work up to an average of 300 cubic yards per day of ten hours. Four excavators constructed by Messrs. J. Boulot & Co., of Paris, had been employed, and three somewhat similar ones made at Lubeck, the latter being known as the "German," the former as the "Frenchman," excavators. The seven machines were of the bucket ladder kind, and were, indeed, land-dredgers. The first cost of the French dredger was about 2,400*l.*, and under favourable circumstances it was competent to remove a great amount of material. The best day's performances recorded in its favour are as follows:—Section No. 3, 1,943 cubic yards; No. 5, 1,624; No. 7, 2,250; No. 8, 2,025 cubic yards. These are remarkable figures, but the soil and other circumstances must be suitable in order to afford such results. The average day's work on all the districts is about 1,500 cubic yards. If 440 waggons, containing 1,650 cubic yards, were filled per day on section No. 8 by the "Frenchman" it was considered a fair day's work. A bonus of a penny per cubic yard was paid to the men on everything above this quantity. For the excavation of this quantity of material the average daily expenses of the machine in coal, stores and repairs, the last item being heavy, were about 60*s.* per day, or 0·48*d.* per cubic yard excavated. There were employed upon the excavator an engine-driver and a stoker, and round it a number of men varying from 28 to 43, the average number being 35; the roads required frequent moving. The land dredger, known as the "German," is made by the Lubecker Maschinenbau-Gesellschaft, Lubeck. The differences between the German and the Frenchman are slight. The best day's performances on the different sections of the canal are as follow:—Section No. 3, 2,073 cubic yards; No. 4, 1,736; No. 5, 1,725; and No. 6, 2,400 cubic yards. The average day's work is 1,416 cubic yards, with an average number of 36 men. It weighs about 70 tons, being a lighter machine than the Frenchman, and generally less substantially built; its first cost is the same, namely, about 2,400*l.* The heavily-timbered roads required for working the German and French land-dredging excavators

increased the cost of working; and as the first cost of these machines is heavy, the cost of excavation does not fall much below the rate of steam navvies, which may be taken in average soils to be 2*d.* per cubic yard, while that of the grabs may be taken at 3*d.*, and that of the land-dredging excavators at 1½*d.* per cubic yard. One peculiarity of the excavation has been the employment of a large number of side-tip waggons, capable of holding 4½ cubic yards each.

Summarising the results of experience in the working of land dredgers in England, it may be said that in light material and on level ground they will fill waggons at considerable speed and with economy; and where large excavations of soft material have to be made with rapidity the bucket-dredging system gives the cheapest and best results. But they will not excavate heavy or strong material; they are difficult and expensive to maintain, and therefore cause delay to the work; they require a costly and a heavy road, and special precautions on soft ground to prevent them from tilting over into the cutting, and they are expensive to move from one cutting to another. The Ship Canal Company also own four powerful steam dredgers. The Manchester is a hopper dredger, built by Messrs. W. Simons & Co., of Renfrew, and has double screws at each end of the vessel so that it can steam either way, thus avoiding the necessity of turning in the canal. It can dredge 800 tons per hour in favourable material. The Mersey and Irwell dredgers were built by Messrs. Fleming & Ferguson, of Paisley, in the bed of the canal between Manchester and Warrington. They each dredge 400 tons per hour into hopper barges. The Barry dredger also delivers into hopper barges. There are also working on the canal three other large dredgers hired from Preston, Ayr, Dumbarton and the Weaver Navigation, besides smaller dredgers, grabs, &c., worked on barges.

At Ellesmere Port there is an embankment faced with stone one mile long across an enlargement of the estuary. On each side of the foot of this embankment close timber-piling is driven, consisting of piles 13 to 14 inches square and 35 feet long. Over 13,000 of these piles have been driven through sand without any trouble by the use of the water-jet principle. Four steam pumps were used, which delivered the water at a pressure of about 30 lbs. per square inch through 2-inch indiarubber pipes to the pile, where it was attached to a 1½-inch wrought-iron pipe, which was put down under water-pressure alongside the pile. With this assistance the steam pile-engines quickly drove the pile, which, without the disturbance caused by the waterjets in the sand, could not be driven. Steam pile-engines are employed on various sections of the work.

ABERDEEN IMPROVEMENTS.

ACCORDING to the *Aberdeen Daily Press*, the Improvements Committee of the Town Council have approved of a scheme for the extension of Marischal College. It is proposed to acquire the whole of the property in front of the college, on the east side of Broad Street, from Littlejohn Street on the north to within 80 feet of Queen Street on the south, absorbing the upper half of Longacre. It is further proposed to acquire, on the north side of the college, the whole of the property on the south side of Littlejohn Street for a distance of nearly 300 feet from the Gallowgate—fully half-way down towards West North Street; and on the south side of the college it is proposed to acquire the property lying within a line drawn eastwards from the point already indicated (about 80 feet from Queen Street) towards West North Street for a distance of about 440 feet. The boundary line of the University on the north, west and south sides would then run along Littlejohn Street, from a point fully half-way down, to Broad Street; then along Broad Street to within 80 feet of Queen Street, thence eastwards for a distance of about 440 feet. So far as new buildings are concerned, it is intended that the addition to be made to the south wing of the college should consist of a building 130 feet long by 60 feet wide, to be erected as a continuation of the present south wing, but on the site of Longacre. The south wall of the present wing would thus form the north wall of the new building. The additions proposed to be made to the north wing are of a more extensive character. They include the widening of the present north wing by 30 feet, making the total width of the wing 65 feet; also the elongation of the wing by the addition of a new building, 135 feet long by 60 feet wide. This building, like that proposed to be added on the south side, is retired from the line of the present wing, the north wall of the present wing forming, generally speaking, the south wall of the new portion of the block.

The removal of Greyfriars Church is also included in the scheme; the plans of the new buildings show the church converted, on the existing site, into a graduation hall. Provision is also made in the plans, however, for the Greyfriars congregation. It is proposed to erect the new Greyfriars Church in the south-west corner of the new ground of the college, and, as at present proposed, the new church will be 130 feet long by between 40 and 50 feet wide. The building is shown in the plans standing east and west, with the gable towards Broad Street, but the site will be one of especial prominence, since Broad Street is proposed to be greatly widened in front of the college, and the greater part of the north frontage of the church will face the widened portion. This widening of Broad Street is one of the main features of the scheme. The boundary of the college ground towards the street will be marked from the new Greyfriars Church to Littlejohn Street with a massive ornamental railing, two main entrance gates being provided practically on the site of the present entrance. It is proposed to set back this railing so as to add to Broad Street, between the points named, a piece of ground measuring 75 feet at the church and about 5 feet at Littlejohn Street. The Gallowgate, which at this end at present is only 20 feet wide, will then have a width of 40 feet from Littlejohn Street to Broad Street, and the last-named thoroughfare, from Gallowgate to the new church, will have an average width of between 80 and 90 feet. These are the alterations provided for in the plans as they stand, and, according to them, Gordon's Court of course disappears for ever from the scene, and Longacre is diverted into Queen Street. It may be noted that the suggestion is also made that abundant space for extensions could be secured by the purchase of properties between the college and Littlejohn Street on the north side, and between the college and Shoe Lane and Henderson's Court on the south. The cost of carrying this comprehensive scheme into effect is very considerable. It was reported to the meeting that Mr. Mackenzie, architect to the college authorities, estimates the cost of new works at 34,000*l.*, and of properties to be acquired 27,450*l.*—including 3,000*l.* for Greyfriars Church—a total of 61,450*l.* The acquiring of the properties for future extensions would involve an additional outlay of 11,000*l.* It was contended, on behalf of the college authorities, that the scheme would mean a very extensive city improvement, and on that account they asked that the Town Council should meet a proportion of the cost of acquiring the properties. They fix the proportion of the cost of acquiring properties to be borne by themselves at 13,650*l.*, and their proportion of the total cost at 47,650*l.*, leaving a proportion, amounting to 13,800*l.*, to be borne by the Town Council.

THE CORINTH CANAL.

A CORRESPONDEET of the *Evening Post* of New York gives the following description of the works now in progress for the canal across the Isthmus at Corinth:—

Here we were at the entrance of one of the most stupendous works of the nineteenth century or of any century. I looked upward and inward. The prism of the excavation is a little less than four miles long and perfectly straight. The ground rises rather abruptly at either end, and continues to rise gradually to a point about midway, where it is 260 feet above water level, *i.e.* 100 feet higher than Niagara Falls. The cut is to be carried 22 feet below water level, and the width at bottom is to be 86 feet. The slope of the bank is 60 deg., the material a calcareous tufa, having the appearance of an indurated clay, being perfectly secure at that inclination, and not washing perceptibly by rain.

Engineers will understand what is implied by a cut of this magnitude, but laymen can appreciate it only by standing at the base of the excavation and looking upward. I did not get the full effect as it will be eventually, because there is still about 60 feet vertically to be taken out; but the impression one receives when passing through the canal in its present state, and reflecting that this is all the work of man and not of the Cyclops, is quite overpowering. Looking inward, that is, towards the western end, the canal seemed to be filled with fog, and I supposed that there must be a mist driving in from the Gulf of Corinth. But this appearance was due to the dust caused by the workmen who were digging down the sides of the prism, standing on a series of steps extending from bottom to top. There was a shower of earth falling along a space of half a mile near the centre of the cut. This material was disposed of by steam dredgers, which lifted the loose earth in buckets on an endless chain, and deposited it in cars to be drawn by locomotives to the dumping grounds. This is the widening process.

The deepening process is quite different. For the latter a trench is first sunk, wide enough and long enough to receive a train of cars. At the end of the trench inward a tunnel is excavated to receive the train. From the top of the tunnel to the surface of the superincumbent ground, where the labourers stand, may be 20 or 25 feet vertically. Then shafts are sunk at regular intervals down to the tunnel, along the line of the railway track, and the earth is shovelled into these openings and finds its way with the least amount of manual labour into the cars. The openings gradually assume a funnel shape like mill hoppers extending the full width of the prism, and accordingly a person desiring to traverse the canal must skirt the perimeter of these hoppers at the risk of depositing his mortal clay

along with that of the Corinthian isthmus in the cars below. Experience had made Mr. Mavrocordato, the engineer in charge, an adept in this kind of spiral exercise. Nor did he seem to be at all disturbed by the blasting operations that were going on both overhead and under foot. My own nerves were somewhat shaken. My Turkish dragoman was the first to retire, which he did on a plea of sore eyes and affliction thereunto from the dust. With some help from the shovellers I surmounted eight of these funnels, all that were then in operation, and soon found myself on the Corinthian side of the cut. I knew that returning would be as tedious as go o'er, and so I found it, but there was no mishap and no great fatigue in either direction.

The material taken out is a calcareous tufa, but is not of uniform colour. It is firm enough *in situ* to require blasting, but the blasts are of low power, merely loosening, not shattering, the material. In one place only a wall of true limestone is encountered, a part of the backbone of Greece, but here it is only a few feet in thickness. Probably the material is of the kind that an engineer would choose for such work if he could have his choice, as it is not really refractory, and yet has no tendency to slide.

The present Corinth Canal—there was an old one begun by the Emperor Nero, A.D. 67, on exactly the same line—was initiated by a French company in 1882, the Comptoir d'Escompte being its financial agent. When the latter failed in consequence of the great copper speculation, the work on the canal stopped for want of funds. After an interval of two years it passed into the hands of a Greek company which has found the means for completing it. Twelve hundred men are now employed upon it. These are Armenians, Italians and Montenegrins. The wages paid is equal to sixty cents per day of our money. I saw them taking their midday meal. It consisted only of bread, water and a few olives. Mr. Mavrocordato tells me that the canal will be finished within three years, and that it will admit the largest merchant ships now in use in the Mediterranean, and will enable any two of them to pass at any point. Being a sea-level canal, it can be operated at the lowest cost.

ST. CHAD'S COLLEGE, DENSTONE.

THE dedication festival in connection with St. Chad's College, Denstone, and the celebration of the completion of the college buildings took place on Wednesday in last week. The foundation-stone of the new hall was laid in 1888. Following the ancient Benedictine models adopted by the founder of Lancing College for his school buildings, the hall is second only in importance to the chapel, which stands on the southern wing of the Selwyn quadrangle. The hall itself forms the northern side, and the large schoolroom, with its wings, is the connecting link between them. The structure is in two storeys, of which the hall proper forms the upper storey. The inside dimensions of the hall are 93 feet long by 35 feet wide, with a height of 18 feet to the cornice and 35 feet to the highest point of the wooden ceiling under the timbers. The hall is lighted on the south side by five three-light windows, and some smaller lights in the eastern gable. The exterior is in unison with the rest of the college buildings, and is in the Early Pointed style of architecture. The work has been carried out from the designs of Messrs. Carpenter & Ingelow by Mr. Bentley, of Waltham Abbey. With this addition the school buildings are practically complete. The cost of the work has been about 70,000*l.*, a sum which has been raised by public subscription, mainly owing to the efforts of the vice-provost, the Rev. H. Meynell.

CHURCH BUILDING AND RESTORATION.

Bingley.—The foundation-stone of a proposed new church for Harden, near Bingley, has been laid. Messrs. Healey Bros., of Bradford, are the architects. The church will be in the Early English style of architecture, with nave, chancel and north aisle. The total cost of the church is estimated at 2,050*l.*, and when erected it will seat about 250. The internal fittings will be of pitch pine, with open benches.

Halifax.—A new Primitive Methodist chapel and school in Queen's Road, erected in place of the old premises in Gibbet Street, have been opened. The new chapel and school are in the Gothic style, and on the one-floor system, there being no galleries. The chapel will seat 460 persons. The fittings are of pitch pine, except about the communion, where they are of mahogany. The school will accommodate 400 scholars, and there is a lecture-room, also sixteen classrooms. The expenditure is about 6,000*l.* Mr. J. Farrar, of Halifax, is the architect.

Peterston-super-Ely.—The pretty and ancient church of Peterston-super-Ely has been reopened after undergoing restoration and redecoration under the superintendence of Messrs. Kempson & Fowler, architects, Llandaff. New floors and steps have been laid, and a beautiful oak screen has been erected across the chancel arch. The new chancel seats are also in oak. The whole of the oak work and carving was executed by Mr. W. Clarke, of Llandaff. The plastering and wall decoration was executed from the architects' designs by Mr. Morgan, decorator, of Canton, Cardiff. The peal of six bells in the belfry have been recast and rehung.

SCHOOL BUILDINGS.

Hoylake.—The new Church of England day schools have just been opened at Hoylake. The schools, which are of red brick, stand at the far end of the village. There is accommodation for 500 scholars, and the total cost, exclusive of site, is 2,000*l.* Mr. T. Clarke, of Liverpool, is the architect.

Foleshill.—New Board schools are to be erected on a site in Brickkiln Lane. The buildings are planned to accommodate 400 children. The buildings will be of plain red brick, with moulded labels and dressings, and the roofs will be covered with best Broseley tiles. The plans have been prepared by Mr. T. F. Tickner, M.S.A., architect, of 7 Bishop Street, Coventry, under whose superintendence the work is to be carried out.

Barnstaple.—The memorial-stones of a school chapel, to be erected at Newport in connection with the Wesleyan body at Barnstaple, have been laid. The new premises are intended to seat 230 persons. The erection of the chapel proper, for which a site is reserved, is deferred for the present. Mr. A. Lauder is the architect, the builders being Messrs. Cooke & Hancock.

NEW BUILDINGS.

Bromsgrove.—A new cottage hospital has been opened at Bromsgrove by Earl Coventry. The hospital, which is built upon the pavilion system, has been erected from the designs of Messrs. Cotton & Bidlake, architects, Birmingham, by Messrs. Brazier & Son, contractors, Bromsgrove.

Hull.—The Victoria Children's Hospital, Park Street, has been opened. Plans submitted by the late Mr. B. Musgrave were adopted. The work has been carried out by Mr. W. H. Bingley, who, with the late Mr. Musgrave, prepared the plans. The building is of red brick, with dressings of the well-known Ancaster stone of the Lindley quarries. Messrs. George Jackson & Son, Hull, have been the contractors for the entire work, and Mr. J. Halcrow was engaged as clerk of the works. The sub-contractors have been Messrs. Dawber & Sons, slaters; Mr. G. Taylor, plumber; Mr. Watkin, painter; Messrs. Bradford & Co., Manchester, kitchen and laundry arrangements; and Messrs. King & Co., ironmongers.

GENERAL.

Mr. Andrew Murray, principal clerk in the City architect and surveyor's office of London, has been appointed City surveyor, at a salary of 1,000*l.* The office of City architect has been abolished.

A Stone Statuette of a bishop attired in full canonicals has been found in Kirk Entry, Dundee, while clearing out a drain. It is supposed to have occupied a place in St. Mary's Church in pre-Reformation times. The figure, which had been about 2½ feet in height, is skilfully carved.

Lord Mostyn has given a site and Lady Augusta Mostyn 1,000*l.* towards the erection of a new church at Llandudno.

A Faculty has been granted in the York Consistory Court for the erection of a new reredos in the church of St. Michael, Neepsend, Sheffield, according to plans by Messrs. Cotterill & Scholefield, architects, Victoria Chambers, London.

The "Standard" says the excavations which have been going on at the village of Triel, where James II. was supposed to have buried his crown and other treasures, have proceeded to such an extent that the municipal authorities have been compelled to interfere, as the safety of some of the buildings in the neighbourhood has been seriously endangered.

Mr. Herbert Riches, architect, has removed his offices from 59 and 60 Cornhill to No. 3 Crooked Lane, King William Street, E.C., in consequence of alterations to be made at the former premises.

Mr. John Douglas, architect, Chester, has prepared plans for a new church in Newtown, which is to be erected on the site of the existing building.

Mr. J. E. Wright, architect, has been placed on the bench of magistrates for Warrington.

The Chancellor of the Chester Consistory Court has granted a faculty to the vicar and wardens of Wybunbury parish church authorising them to take down the whole of the present church with the exception of the tower, and rebuild it partly on the present site and partly on the churchyard adjoining.

The Architect.

THE WEEK.

THE following papers were to be read at the meeting of the Society of Antiquaries, Ireland, which is being held this week at Killarney:—1. "The Island Monasteries of Wales and Ireland," by Rev. Professor STOKES. 2. "Celtic Art in Wales and Ireland Compared," by J. ROMILLY ALLEN. 3. "The Great Earl of Desmond," by Rev. DENIS MURPHY, S.J. 4. "The Voyages and Adventures of St. Brendon, the Navigator," by Rev. T. OLDEN, M.A. 5. "Ballynoe Stone Circle, co. Down, and a notice of the neglected condition of the supposed Grave of St. Patrick, at Downpatrick," by WILLIAM GRAY, vice-president. 6. "Description of an Ancient Celtic Shrine, *circa* A.D. 800, found in Lough Erne during the present year," by THOMAS PLUNKETT. 7. "The Ogam Cave of Dunloe, near Killarney," by the Right Rev. Dr. GRAVES, Bishop of Limerick. 8. "Notice of an Ancient Wooden Trap, probably used for catching Otters," by Rev. GEORGE R. BUICK, M.A. 9. "Two rare Stone Implements, found at Lough Gur, co. Limerick," will be exhibited and described by Rev. J. F. M. FFRENCH. 10. "Mor, Sister of St. David of Menevia," by Rev. DENIS O'DONOGHUE, P.P. 11. "Methods of Construction employed at Kilmalkeldar and the Oratory of Gallerus," by ARTHUR HILL, B.E.

WE hope the very numerous purchasers of membership tickets for the Congress of Hygiene and Demography will be convinced before the week ends that architects are not the authors of all the ills which afflict human bodies. If so the money will be well laid out. It is convenient to find one cause for effects and defects, and at a time when the old recipes no longer inspired confidence, it was easy to imagine that doctors and undertakers' bills were closely related to defective drains. Any one who heard or will read the address of Sir JOSEPH FAYRER on Preventive Medicine must be assured that there are many potent causes for high death-rates besides badly-arranged houses, although the latter may count for much. At present sanitarians are only fighting in the dark, for little is known about the causes of disease, and the efforts of physicians to deal with them may still be described in BULWER LYTTON'S words as "putting substances of which we know little into bodies of which we know less." In spite of all the researches of PASTEUR and others, the new microbe theory is as inadequate to solve all difficulties as the theory of drains. It may be assumed that in time there will be a theory of disease established which can be generally accepted. But it is never likely to be one which can dispense with the co-operation of many agents, and the Congresses of Hygiene not only give hope of such a theory as is desired, but they educate men to believe that so complex a result as public health is only to be attained by the efforts of all the inhabitants of a country. At the present time in England sanitary administration is not aided; in fact, in many parts the work of the officers is impeded, directly or indirectly. Until a change takes place, the progress of sanitation will be slow. If the congresses can aid in teaching all classes that they should regard themselves as parts of a great body, and that individual neglect leads to serious consequences, the meetings cannot take place too often in England.

AMONG the curiosities of architectural history which are not generally known is the part taken by the Empress EUGÉNIE in the competition for the Paris Opera House. The circumstances are as strange as any which have been recorded in connection with such contests. Her Majesty took great interest in the project for the new building, but it was not until almost the last moment that she was inspired with the ambition to contribute a design. As not uncommonly happens with the attempts of amateurs, the imperial design bore a resemblance to an existing building, the favoured one being the town-hall of Brescia, and the choice was creditable, for PALLADIO was an enthusiastic admirer of the edifice. But it was necessary to have the drawing worked up to competition pitch. First one of the draughtsmen attached to the Tuileries operated on it, then it was handed over to M. CHABROL to put in some finishing touches. But what amateur is satisfied with other people's endeavours to give definiteness to his beautiful, if hazy, conceptions? The Empress was annoyed, and the task of newly interpreting the sketch was confided to M. CHARLES GARNIER, whose fate was depending on the same competition. But the architect, as became a courtier, was a diplomatist, and at his suggestion the aid of M. LOUVET was invoked. At last the design appeared in a form that was considered presentable. Meantime the period assigned for the preparation of designs had passed with that celerity which is known to all competitors. The controller of the arrangements was fortunately the Count WALEWSKI, and the conditions were therefore set aside. The design was admitted, and the motto suggested its history, "Mieux vaut tard que jamais." But with all their loyalty to Imperialism, the judges could not help selecting M. GARNIER'S design. The Empress, in return for her exertions, has had experience of that hope deferred which is familiar to most competitors, and Count WALEWSKI was enriched by a drawing for which no parallel could be found, even if we go back to the days when SEMIRAMIS became her own architect.

ACCORDING to the *American Architect*, the trustees of the proposed cathedral of St. John the Divine for New York have decided to place the erection of the building in the hands of Messrs. HEINS & LA FARGE, the youngest and least experienced of the four competitors in the final competition. Fortunately youth and inexperience are not cardinal sins, but may even be, when united with natural ability and thorough acquired training, cardinal virtues. The choice, which for many reasons was the best that could be made under the circumstances, indicates one thing pretty clearly and it militates strongly against the ordinary practice of giving to the most successful and popular, and therefore the busiest, architect still further work to do. In the present case, starting with the assumption that the four competitors possessed equivalent capacities, the event has proved that the competitor whose attention was least distracted from the study of his problem by the imperative calls of a busy practice has carried off the prize. Messrs. HEINS & LA FARGE happened to be so situated that they could give undivided and sustained attention to their problem, the result being that their final drawings showed greater evidences of serious study and consequent improvement than did any of the others, and so seemed to give tokens of their intention and ability to still further better the work as it went on. Before the building is finished—perhaps even before it is begun—their youth and inexperience will have been cured.

IN spite of the rise of new watering-places, Brighton still retains its supremacy. From recent sales it is evident that high prices are obtainable for first-class houses. Mr. J. T. CHAPPELL has displayed exceptional enterprise in erecting residences that are adapted to the new conditions of Brighton. One of four just erected in King's Gardens, Hove, has been sold to Mr. JACOB SASSOON for 12,700*l.*, and a further sum of 2,000*l.* has been paid for the decorations. There is no doubt that the purchase, if considered as an investment merely, is a safe one, for, owing to the advantages possessed by Brighton, it is likely to be as much appreciated as it is deservedly at present.

THE subject assigned this year for the Prix de Rome in the Section of Architecture was a railway terminus. The following students were selected as competitors:—MM. CHAUSSEMICHE, pupil of M. ANDRÉ LALOUX; PATOUILLARD, pupil of M. GINAIN; RECOURA, pupil of M. PASCAL; EUSTACHE, pupil of M. GINAIN; HEUBÈS, pupil of M. PASCAL; BERTONE, pupil of M. GINAIN; DEPERTHES, pupil of MM. DEPERTHES and GINAIN; BELESTA, pupil of M. ANDRÉ LALOUX; NORMAND (PAUL), pupil of MM. NORMAND and ANDRÉ LALOUX; VARCOLLIER, pupil of MM. VARCOLLIER and GINAIN. The prize has fallen to M. EUSTACHE. The second prize was awarded to M. PAUL NORMAND, and the third to M. CHAUSSEMICHE, who was placed first among the competitors by the authorities of the School.

THE BERLIN EXHIBITION.—II.

THE American artists are aware that their countrymen are ubiquitous, and consequently they take advantage of as many continental exhibitions as are open to them. In Berlin they are more largely represented than English artists, and they compete with Germany itself in the number and excellence of illustrations for books. As American works are present, the absence of the French School does not cause the gap that was anticipated, for not only do most of the oil-paintings come from Paris, but they are likewise suggestive of French canons, and the works of the pupils are often worthy of the masters. Mr. Healy has so long resided in Paris—he obtained a Salon medal in 1840—as to make some people doubtful of his nationality. The only portrait by him that was obtainable is of M. Jules Simon, which comes from a public library in Chicago. Mr. F. A. Bridgman can express Algerian life as well as his master, M. Gérôme, without any sculpturesque hardness of outline, and he shows a more frank delight in the contrasts of light and shade. Mr. W. Gay studied under M. Bonnat, but his *Weberin*—a woman seated at an old-fashioned loom—might have come from one of Israels' pupils. Mr. Humphrey Moore is very successful with his *Moorish Dance*, and like some more artists, he has also turned the Japanese to account for subjects. Every year reveals additional power in Mr. Charles Sprague Pearce. His *Shepherdess*—a girl in grey leaning on a staff in a heathery field—is one of the works in the exhibition which give most delight. Composition, modelling and colour show the hand of a master who is not afraid to take up a subject that Millet was supposed to have monopolised for ever. Mr. Julius Stewart always surprises a spectator, and *On the Seine at Bougival* is one of his brilliant works in which nothing seems laboured. Mr. Edwin L. Weeks has done more to make India known in the West than any English artist. From their French training American painters find a pleasure that seems to be novel in watching the play of light, some in Africa, others in quiet parts of France, and even amidst the excitement of Paris. In spite of the prejudice against Indian subjects, Mr. Weeks has been successful, for whether in an outdoor scene like the *Restaurant, Lahore*, or the quietude of the *Pearl Mosque, Agra*, which seems built to be a refuge from heat, he is alike true to nature, and, however strong may be his colours, they are so graduated that they always give satisfaction. Mr. A. Bierstadt's works are welcome for their suggestion of space and magnitude, as the artist finds his subjects in America.

It is easy to see that in Belgium there is a growing tendency towards *genre*, under which may be classed landscape and portraits. There are some admirable historical works, and a few pictures would serve for churches, but, however highly they may be esteemed, it is evident that realistic theories are gradually convincing amateurs that it is better to depict human life as it is to be seen, although in humble scenes, and to repress imagination than to attempt subjects in which creative power is necessary. Evidence of the change in taste is visible in the pictures with which frequenters of exhibitions are acquainted. M. Slingeneyer's large *Last Day of Pompeii* may be considered as one of the earliest victims to the new ideas, for when produced the artist was warranted in supposing that it would become public property. Three phases of Mediævalism are brought before us in M. Van Hove's, *Alchemy, Witchcraft and Scholasticism*, a small work which, at first sight, seems like a newly-discovered "early master," but often as it has appeared before the public gaze it has not found a purchaser. It is considered to be too remote from the present time, and the sterling qualities do not avail. M. Hennebicq's *Flight of Messalina*, happily for the artist, was purchased for the Musée in Mons, for the excellence of the work as a vivid history piece would not commend it to ordinary purchasers. *The People of Ghent rendering Homage to the Infant Charles V.*, by M. Albrecht de Vriendt, is one of the most important examples of historical painting that has been produced in our time, and its merits are freely acknowledged in Berlin. In this case, also, the authorities wisely secured the picture for the Brussels Gallery. The *Daughter of Jairus*, by M. Julian de Vriendt, would be worthy of any gallery in Europe, for it is one of the very few modern works which seem inspired by Scriptural simplicity. The tenderness and reverence seen in the composition would almost suggest that the work was painted for a convent chapel. The works of the two brothers denote that, in spite of the causes which make common life supreme in modern art, the power which once gained reputation for the Belgian School is not yet extinct. They are to the manner born, and their pictures of historical, Scriptural and ecclesiastical scenes give that gratification which is felt when men are seen following their true vocation.

M. Alfred Stevens has his worshippers, and an artist merits to be exalted whose influence has been almost as powerful in Paris as in Brussels. For a *Damenkopf* he is not to be surpassed. In the Berlin Exhibition he can be judged by an *Ophelia*, a *Family* and two sea-pieces, which are novel. But the artists should have secured one of M. Stevens's pastel examples. M. Wauters seems now to confine himself to portraits, and the two in oils are characteristic of his manner, which has secured much favour in Belgium. M. Eugene Smits is never more successful than with subjects of a semi-decorative kind, but we have seen better works from his hand than he was able to send to Berlin. About ninety artists have sent paintings, and thus Antwerp, Ghent, Malines, Ypres, as well as Brussels, are able to claim attention.

The Dutch School could hardly be expected to be otherwise than circumscribed. The success of Josef Israels and Hendrik Mesdag was enough to convince a Dutchman, whether painter or dealer, that fortune was almost certain if some narrow routes were followed, and that ambitious subjects were less marketable than those which were homely. M. Mesdag and his followers were able not only to sell their pictures on enviable terms, but they attracted all the world to Scheveningen, which furnished the scenes and converted one of the simplest of fishing villages into a fashionable resort, where the Dutch folk were able to excel themselves in the art of fleecing strangers. M. Israels could hardly increase the interest of The Hague, but he has performed a greater feat, for he has made tragedy popular after it had been scouted as a bore. He can paint as many suffering heroes and heroines as he likes, and so long as they appear in peasants' garments and their performances are supposed to take place in unlighted and smoky rooms, M. Israels is sure of the patronage of all Europe. The critics become sentimental before his pictures and forget all about proportion and colour. Is it any wonder that, after so much success, a modern Dutch collection should appear to be mainly produced by Mesdagians and Israelites?

In Berlin M. Israels has two works, *Peasants at Table*, belonging to M. Mesdag, and *Alone*, which depicts the deathbed of a woman and the despair of her husband. M. Mesdag has a view of *The Strand at Scheveningen* and a sunrise. There are not other pictures with the same titles, but there is so much derived from the annals of the poor and the quietest features of Dutch landscape that the two heads from Tangiers and Seville by M. Haverman, and the picture of a gipsy before a magistrate become almost fascinating. Quietness is an excellent quality, but there is so much of it in Berlin that it becomes oppressive.

The Danes appear to favour many varieties of art, and under different conditions of training they might form a school. As yet they are, on the whole, more successful in sculpture, thanks to the influence of Thorwaldsen and Jerichau, which still is a factor in the schools. Fuseli's manner is recalled by M. Frolich's *Gottes Auge und Cain*, derived from that fertile furnisher of unpaintable subjects, Victor Hugo. The Swiss artist would also be likely to approve of M. Paulsen's *Adam and Eve*, where the recumbent Adam appears to fear his erring consort, who stands over him. It is creditable to have treated so venerable a subject with novelty. As a rule, the Danes prefer the coldest colours, another sign that sculpture was once uppermost among them, but in the *Flight into Egypt*, by M. Lauritz Tuxen, the light falling on the hills that bound the desert, making them glow with orange hues, is a sign that one artist is not afraid of novel effects. M. Zahrtmann, in his *Death of Queen Sophia Amelia*, has also introduced very rich costumes, and even ventures to show a sort of lustre silk in the dress of one courtier. The *Music in*

the Studio, by M. Severin Kroyer, is a scene often painted, and the artist displays skill in contrasting the darkened room with the illuminated music-books and pictures. Evening light is also well managed by M. Michael Ancher, in his *Fishermen on the Beach*, and the task was not easy to dispose it, for the faces and breasts of some of the figures are in shade. Among the portraits, the most striking is one by M. Jerndorff of a professor who appears to be lecturing on chemistry to students of veterinary medicine.

The landscapes by M. Normann, which have appeared in the Salon and other exhibitions, revealed the existence of a landscape school in Norway. The room at Berlin makes it clear that other members of the school can produce admirable work. The *Storm Scene* by M. Dahl is fine in colour, and the landscapes by MM. Sorensen, Nielsen, Ole Juul, Grimelund and Barth are all marked by careful study of nature. In some cases the detail seems almost photographic in clearness. M. Wilhelm Peters, M. Lerche and M. Nordhagen send figure-pieces, and M. Peters's etchings are known to collectors in many parts of Europe.

Sweden has a scanty show, as there are only eight oil-paintings, most of them being landscapes, and three water-colours. Poland has a rather large collection, and from the novelty of the subjects the pictures are longer studied than those in some larger rooms. It is remarkable how many of the pictures come from private collections. Among the landscapes, those by M. Chelmonski seem to be the most successful.

In spite of the coldness which is said to prevail in the political relations between the two empires, Russia is a large contributor to the Berlin Exhibition, and most of the works come from the Imperial Academy and the private gallery of the Hermitage. A sort of gloomy power is seen in many of them. M. Repin's *Nicholas, the Miracle-worker*, depicts a man about to be decapitated, but the sword is seized by Bishop Nicholas. The subject may not be pleasant, but it is dramatically represented. In his *Departure of the Recruit* M. Repin employs fewer figures, for the scene is a peasant's hut which is not equal to accommodate a crowd, but they are well painted and are expressive. M. Ssawitzki makes his *Despatch of Reservists* a scene at a railway station, and the groups are all vigorously painted. A stranger will be sceptical about the contentment which appears on so many of the faces. M. Bakalowitsch, in his *Clienten*, would appear to be eager to outdo Mr. Alma-Tadema, for the marbles in the gallery, where the visitors surround the *Venus de Medicis*, are most elaborate in finish. M. Von Liphardt has taken a subject which was a favourite with Mediæval sculptors, *The Wise and Foolish Virgins*. The wise are clad in white and the bridegroom appears in a red garment. Another picture is mythological, a sort of Olympian contest. There is a very fine battle scene, *The Storming of Ardagan*, with troops rushing over a bridge, by M. Kiwschenko. A more painless engagement is seen in M. Vesin's *Crossfire*, where the occupants of a sledge are attacked with snow-balls from all directions. Among the landscapes M. Aiwasowski's *Sündfluth* is one of the most striking, and it is plain the artist sympathises with nature when it seems to be most destructive; the darkness adds to the terror of the deluge. M. Bogolubow, in *His First Russian Seafight, May 24, 1714*, has produced a most successful work, in which the spectator seems to perceive the commotion of the contest rather than "painted ships upon a painted ocean."

Next to Germany Austria has the largest collection, especially if Hungary can be included, for in the exhibition the two parts of the empire are separated. Austria shows no deficiency in versatility. There is an abundance of portraits, Herr Von Angeli being considered as the first artist in that line, because he is favoured by Courts. Herr Brozik sends a very big picture, the *Fenstersturz von Prag*, the incident which gave rise, as all schoolboys know, to the Thirty Years War and the composition of "Wallenstein." The excitement of the deputies who turn the tables on their enemies is well rendered, but the artist is more successful with the costume of an earlier time. His *Fest bei Rubens* is likely to be a more popular picture. Of late years Herr Brozik has turned from costume pictures to scenes of daily life, and his two pictures of field labourers are good examples of his new style, but his pageants are preferable. Herr Hirschl has two impressive Roman scenes, one representing the Vandals at their destructive work in Rome, the other a Roman marriage festival. There is much to recall death in the saal. Herr Von Payer represents the *Death of Sir John Franklin*. The cabin is dark, and the light falls on the dying explorer, who is propped up by pillows, the head being in profile. His hand is held by the doctor, and around the couch are officers and sailors. The picture is on a large scale and is skilfully painted. Herr Schindler's *Pax* is an ancient cloister full of graves that seem hewn out of the rock. Herr Laukota has an imaginative work, in which the Blessed Virgin appears as the consoler of the wife of a drowned fisherman. Mrs. Marianne Stokes has a pleasing, if sad, picture of a little boy crying beside his sister's coffin, with the title, "You must now play alone; your sister is in heaven." Herr Schmid paints a group of girls praying before a cross, which is a memorial of those who fell in the war against the French.

At the present time the two schools that dominate are the French and the Hungarian. It is expected that sooner or later either must prevail, and the contest thus resolves itself into one between greys and reds. Hungarian pictures are most dangerous neighbours. The two placed among the examples of modern schools in the Munich Gallery make some of those near them appear as washed out, Mr. Lavery's *Lawn Tennis* and Mr. J. R. Reid's *Fishermen* being among the sufferers. It may be said that the Hungarians go beyond the limits of painting, and that in course of time they must see the error of their ways and produce works that will be subdued. There are in Berlin a few works, like the *Heckenrosen* of Herr Von Baditz, which are French in manner, but as a rule the pictures undoubtedly present characteristics that are recognisable as being Hungarian. The artists can teach much to their brethren elsewhere. Compare the sheep and lambs in the picture by Béla Pállik with any of Mr. T. S. Cooper's, and the difference not only in handling but in mere observation will be apparent. If a Scotsman wished to have a picture illustrative of "John Anderson my Jo," he would be likely, after seeing the *Alten Tagen* of Miksa Bruck, to give the commission to the foreign artist—that is if, for the sake of good work, he could forget his nationality.

The Hungarian room has, too, the advantage of revealing so much that is novel in institutions and customs. Herr Bihari's *Before the Magistrate* suggests the simplicity of legal administration. A plain room, so long as a small crucifix stands on the table, and the justice with his clerk are present, will serve as a courthouse. The case which is being investigated relates to a broken fiddle, and the parties are gipsies. The excitement of the men is well contrasted with the calmness of the representatives of the law, who, if shabby, are dignified. The same artist in his *Rumänisches Leichenbegängniss* represents a woman in an open coffin, a priest who appears to belong to a sect of the Greek Church reciting prayers over the body. Herr Ebner has an *Easter Procession* in which peasants participate as cross-bearers, acolytes and canopy-holders. Herr Vágó, in his *Flüchtlinge*, indicates the sympathy which is felt among peasants for those who have to go through the ordeal of removal. Everybody in the inn where the family rest on the way seems ready to express commiseration. It may be remarked that in proportion to the figure-pieces the landscapes seem to be exceptionally few in the Hungarian section.

The Spanish pictures must excite more curiosity than the Hungarian, for, owing to the lack of enterprise, such works are hardly known beyond the Pyrenees. The immense work by Señor Juan Luna, *Spoliarium*, in which the attendants of the amphitheatre are seen dragging out the bodies of the slain gladiators with hooks, we remember to have seen about ten years ago in the Salon, but the remainder may be taken as novelties. There is little that appears derived from the work of Fortuny or Madrazzo, and, in fact, the variety of style is marked. Señor Cubells is the author of the large *Coronation of Inez de Castro*, a subject that is adapted for all who wish to accumulate horror on horror. After all, one version of it must resemble another. In this case, as in those preceding it, we have the crowned and bejewelled corpse rigidly fixed on a throne, and the

terror-stricken courtiers ranged in front. But there is an addition in the form of a boy, which might advantageously have been omitted, for it seems to be an unnecessary piece of cruelty invented by the artist. Señor Ferrant is evidently a master of chiaroscuro; his *San Sebastian*, which also is on a large scale, depicts the lowering of the body of the martyr into the catacomb, and if the work as a whole appears academic all the figures are modelled with a care that might be called old-fashioned. Señor Sala has given a new interpretation of a subject of which there are several pictures, *Expulsion of the Jews from Spain*, but what is depicted is the interview of the Dominican with the King and Queen, when the order for expulsion was secured by overturning a crucifix, which was said to be a sign of the royal apostasy. In the picture the monk turns his back on the King and Queen. Señor Carboneros's *Don Quixote and Sancho* are unlike the types employed by English and French artists; the knight is far more of a commonplace tourist. The splendour which ecclesiastical ceremonies assume in Spain is indicated by Señor Gallego's *Marriage in the Sacristy of Seville Cathedral* and in the *Benediction*.

The Italian collection is a mixture of works that gratify, with others that disappoint. One can imagine that all the artists are competent, but many are too indifferent to exert their full strength. Carefully painted pictures are companioned by some that seem to be produced as sleight-of-hand feats. Among the works which are most satisfactory are the *Venetian Flower Festival*, by Signor Vannutelli, a religious procession over a range of boats; the *Spring* of Signor Oca Bianca, in which old people and young are introduced; the *Death of Virginia*, by Signor Miola; the *Scirocco*, by Signor Fragiacomo; the *Market Place*, by Signor Favretto. It must be admitted, however, that far finer works were seen in the Italian Exhibition that was held at Earl's Court.

To carry out the international character, there are works shown from Switzerland, Greece, Turkey and Japan, but they have no importance. Without their aid the Berlin Exhibition is attractive, and much is to be gained from a careful examination of its contents.

THE PRESIDENTSHIP OF THE ROYAL SCOTTISH ACADEMY.

On July 28, says the *Scotsman*, at an informal meeting, the Academicians appointed a deputation to wait upon Sir Noel Paton to request him to allow himself to be elected to the presidential chair, vacant by the death of Sir William Fettes Douglas. Sir Noel requested two days to consider the subject. On the 29th a letter was received by the secretary from him declining the nomination. On Saturday afternoon the members of the Academy met in the library of the Academy to proceed with the election of a President. Mr. John Hutchinson, treasurer, was called to the chair. At the outset the secretary (Mr. George Hay) read Sir Noel's letter, which was in the following terms :—

"33 George Square, Edinburgh : July 29, 1891.

"Dear Mr. Secretary,—My friends in and out of the Royal Scottish Academy have always been aware that my aversion to the assumption of public duties and responsibilities is so deep-rooted that at no time could I have sanctioned my nomination as a candidate for the presidentship of that body ; and on the two previous occasions when the office became vacant my unalterable resolution in this matter was made widely and unmistakably known. Naturally this aversion on my part has not diminished with advancing years. But the unanimous desire of my brother Academicians—as conveyed in the formal requisition yesterday presented to me—that I should allow myself to be elected to the presidential chair, places me in a different position ; and had existing circumstances permitted, I should have felt constrained to overcome my personal love of retirement, and at once accept an honour offered in a manner so gratifying to my best feelings as an artist and a man. But—availing myself of the time for consideration courteously conceded by the deputation—I have given the whole question the most anxious and careful thought, alike in its relation to the Academy and to myself, and I am forced to recognise that, at my time of life and with my uncertain health, I could not undertake the onerous duties of President with any hope of being able to discharge these duties in the way the Academy has a right to expect, and as, in the interests of the National School of Art, they ought to be discharged. With the sincerest regret, therefore, I feel that I have no choice but to decline the proffered distinction. Of the confidence so flatteringly indicated by the action of my brethren on this occasion I must ever feel proud, while for their generous assurances of forbearance and assistance in the work of the chair should I accept the office, I must ever feel deeply grateful. In spite of my inability to accept the office of President, however, I trust it goes without saying that for the term of life that may yet remain to me nothing will be wanting on my part to render what humble help I can in furthering those objects for the honour and advancement of art in Scotland which I know the Academy has so deeply at heart, and towards which it is striving, through difficulties which I certainly believe fuller knowledge of its history and wiser sympathy with its efforts, in quarters outside its borders, would materially diminish, if not altogether remove.—Believe me to remain, very faithfully yours,

"Noel Paton.

"George Hay, Esq.,
"Secretary, Royal Scottish Academy."

Thereafter the Academicians unanimously elected Mr. George Reid, R.S.A., to be President. Mr. Reid was not present at the meeting, but his election having been communicated to him by letter, a reply was read from him at the Academy in the course of the afternoon accepting the chair. The *Aberdeen Free Press* gives the following history of the new President :—

Mr. George Reid is the son of the late Mr. George Reid, who as ironmonger and blacksmith, had his business premises in Queen Street, and he was born in Aberdeen about the middle of the forties. The mantle, therefore, of the President of the Royal Scottish Academy falls on comparatively young shoulders, younger probably than those of any former President. Mr. Reid was educated at the Trades School until he was about fourteen, when he was apprenticed to Messrs. Keith & Gibb, lithographic draughtsmen. In the early years of his apprenticeship, Mr. Reid attended the art classes under Mr. Peter Cleland at the Mechanics Institute, where he succeeded one year in gaining a national medal in design. This circumstance had its own influence in promoting the pursuit of art as something more than the work of the mere artisan. Surely there never was a more fruitful apprenticeship. Mr. Reid's hand never tired, and, whilst he became an expert at all the branches of his business proper, and often investing with an artistic feeling what naturally lent itself to the bald and mechanical, he was year by year making rapid strides in art studies, sketching continually in pencil, chalks, water-colours, and in oils, and all with a determination of purpose and enthusiasm seen only in those who are destined to fill a high and honourable place. It may be mentioned here that alongside Mr. Reid were other two who have since followed out the artistic profession with considerable credit—Mr. John Mitchell and Mr. George Russell Gowans, the works of both being well known. For only a few months after Mr. Reid's "time" was out did he hesitate as to his course of duty, but the spell of art growing with his growth soon determined his course. Thus, towards the close of 1861 Mr. Reid made a new departure by boldly entering the life class at the Royal Academy, Edinburgh, and no longer handicapped with a tale of hours spent at a handicraft not wholly subservient to his purposes, he made excellent use of his opportunities.

In 1862 he opened his studio in Aberdeen, and in the fall of that year painted as his very first portrait the likeness of his friend, Mr. John Bulloch. The next year or two was the disciplinary period of the young artist's career, but the excellency of his work soon attracted attention. Its fidelity to nature, the result of infinite painstaking at every stage, was early recognised, and to paint and exhibit was infallibly to sell to connoisseurs eager to buy. From that period till now Mr. Reid's career has been one unbroken run of success. In the earlier period of Mr. Reid's career there can be no doubt that his personal preference and ambition lay wholly in the line of landscape-painting, but commissions in portraiture have been so persistently thrust upon him that to a certain extent he has been thwarted in his own objects. His numerous and varied landscapes make a gallery of great excellence, but his more numerous portraits done in the maturity of his prime of the notables of his day in all circles will remain a grateful enrichment, especially of Scottish life and history. In a manner as wholly his own as was Raeburn's or Ramsay's, Mr. Reid's portraits are second to none, and possess a verisimilitude to life truly remarkable.

In 1865 Mr. Reid, as is often the case with young artists, fell under the influence of a fellow-artist, Mr. Mollingar. This Dutch painter's pictures possessed for Mr. Reid an undefinable charm ; such a positive spell, in short, that in 1866 he passed over to Utrecht in order to be near him, and to paint beside him. There can be no doubt that Mr. Reid caught truth from Mr. Mollingar, namely, the immense importance which attaches to the tone of a picture. It was not, however, till Mr. Reid passed this truth through the alembic of his own methods, until, in short, he bettered the instruction, that he got the better

of the Mollingar influence, and his pictures lost any mimetic trace.

In 1869, he went to Paris and joined the *atelier* of M. Yvon, then largely frequented by students of all nationalities. In that year Mr. Reid painted the portrait of Dr. George Macdonald, which was the first of the artist's works to be engraved. Next year brought Mr. Reid the reward of Associateship of the Scottish Academy, where he had been steadily exhibiting for eight or ten years, and in 1878 he was elected to full membership. It would be impossible in this sketch to detail one-half the important products of Mr. Reid's work in portraiture or landscape, but there is the less need in his native place where his fellow-citizens have with a just pride watched his increasing power and popularity. Suffice it to say that there are few public collections, or for that part not many private collections, which do not possess a coveted specimen of Mr. Reid's work. For many years Mr. Reid's aid in book illustration has been sought and highly appreciated. His character sketches for Dr. William Alexander's "Johnny Gibb" have been much admired. So have his sketches in Dr. Smiles's "Life of Thomas Edward," and the beautiful drawings for the Art Association of Scotland, given to subscribers a few years ago. There is not a variety of the graphic art which Mr. Reid has not essayed and excelled in. His latest book work is in Mrs. Oliphant's recent book on Edinburgh. All his work of every description bears the stamp of care and study, without trace of scamping. For the greater convenience of his numerous clients, Mr. Reid removed to Edinburgh five or six years ago, where he now paints during a large part of the year, using the studio at St. Luke's, Aberdeen, during a portion of the summer. Mr. Reid has been followed in his profession by his two brothers, Mr. Archibald Reid and Mr. Samuel Reid, both of whom exhibit works of high excellence. Aberdeen has been long and honourably distinguished by the artists who have sprung from her, and not least by the notable career of Mr. Reid, with whom the city shares the high honour now fallen on him. Mr. Reid will adorn the position, for he is, besides being an artist of high order, a man of cultivated and literary tastes, of wide reading, and has written not a little on subjects relating to art.

BRITISH ARCHÆOLOGY IN GREECE.

A CORRESPONDENT of the *Times* writes as follows:—The progress of classical study and exploration in Greece cannot fail to be a matter of interest to Englishmen of ordinary culture and education—not to speak of specialists and scholars; and your readers may be naturally disposed to inquire whether British learning and research are adequately represented in the international competition for archæological honours to which the career of Dr. Schliemann has given such a powerful stimulus.

In the foundation of an institute for the prosecution of archæological research in Hellenic lands France has been first in the field. The handsome Ecole Française at Athens was founded as far back as 1846. It belongs to the French Government, and receives a subvention from the State; it is under the direction of distinguished scholars, and its junior members are chosen from among the most promising students in the University of France. The stipend of both is paid by the Government, and includes allowances for travelling expenses and exploration. The German Archæological Institute, which is younger by twenty-three years than its French competitor, is also a Government foundation, and receives an endowment, which, though liberal, is hardly commensurate with the splendid services rendered to archæological science by the eminent men who have been connected with the School. The French discoveries at Delos, Delphi and elsewhere hardly yield in importance to the better-known results of German exploration; but a comparison of the achievements of either School would be out of place here; it is sufficient at present to emphasise the fact that both these institutions receive State support, and stand on what may be described as a sound financial basis. With regard to other nations, Austria-Hungary is unrepresented, and so is Italy; the latter, however, may plead that she is fully occupied with her own vast treasure of Hellenic remains. A Russian School of Archæology has long been talked of, but it now seems probable that the building will be erected, not at Athens, but at Constantinople, its projectors, no doubt, cherishing the hope that it may one day be found to stand on Russian soil. The Greek *savants* do not yield in zeal and ability to their brethren from abroad, and the native antiquarian associations at Athens are directed by skilled and accomplished archæologists.

Greek scholarship and research among English-speaking peoples find a *pied à terre* at Athens in the British and American Schools of Archæology. The modest scale on which these institutions have been designed and equipped is somewhat in contrast with the more elaborate installation of their French and German rivals. As the visitor makes his way along the southern slope of Mount Lycabettus in an easterly direction, he finds at the outskirts of the town two unpretending, villa-like structures, standing in their own grounds. The nearer and smaller of the two is the British School of Archæology, the larger and more distant is the American School. The British School, which in reality is nothing more than the director's house—apartments for students not yet having been provided—was erected in 1886 on a site presented by the Greek Government. The situation is healthy and beautiful, commanding charming views of Hymettus, the Gulf of Ægina and the distant hills of the Morea. The principal feature of the building is a large and well-stocked library, from which not only the students of the School, but English and other visitors to Athens can borrow standard editions of the classics, as well as most of the important works on Greek history, art, topography and archæology. The absence of accommodation for students is a serious defect, and is due to want of funds; the students, of whom twelve were admitted during the past session, are for the most part obliged to find lodgings in the town. This is only one among many instances of the manner in which the British School is crippled by a deficiency of ways and means; and the fact that it is compelled to lead a struggling existence is, it must be said, not altogether to the credit of the richest nation in the world.

Notwithstanding its straitened circumstances, the British School has contrived to hold its own against its older and more richly endowed competitors. It has not, of course, accomplished anything to rival the German excavations at Olympia; it has not, as yet, discovered a Hermes, nor can any of its members claim a European reputation such as that of Dr. Dörpfeld. Nevertheless much has been effected. Not to speak of the researches prosecuted in Cyprus by members of the School in recent years, the excavations carried out last season, for the first time, on the Greek mainland have yielded results of the highest interest and importance. The field of operations was the site of Megalopolis, the "great city" of Western Arcadia, which owed its origin to the genius of Epaminondas. The excavation lasted over eleven weeks, some ninety native labourers being employed. In addition to the discovery of an enormous stoa with a triple line of columns, and a remarkably fine altar adjoining it, a large theatre in good preservation was partially dug out, the front row of seats, or Θρόνοι, bearing inscriptions of the classical period; and an elevated stage was laid bare, the construction of which appears to determine in the affirmative the long-debated controversy as to whether the Greeks used the proscenium for the purposes of a stage. A tumulus was also excavated, and a cylindrical stone vessel brought to light, containing human remains and some interesting gold ornaments, probably of the Hellenistic period. Among the inscriptions discovered was a Greek version of the celebrated edict of Diocletian, which regulated the prices for which various commodities were to be sold. The excavations are to be resumed in the present year, but some 300*l.* is needed for their completion.

But the excavations carried out by the British School, however valuable in their results and interesting to the world of antiquarians, can hardly be regarded as the most important portion of its work. Its educational labours are of still greater consequence. Every year some of the most brilliant scholars of their time at Oxford and Cambridge—as a rule young men who have just taken their degree—are admitted as students, and during their residence at Athens they are furnished with opportunities of studying, under competent direction, those unique remnants of ancient art which throw such a powerful light on the life, the literature and the civilisation of classical Greece. Hitherto their ideas have been derived from books or from book-taught men; now they see before them the handiwork of Phidias and Iktinos; they hear the voice of Pericles in the Pnyx, and wander with Plato in the "groves of Academe;" around them are the mountains and the sea which inspired the genius of antiquity with a thousand fancies, and were peopled by it with a thousand forms. They are thus enabled to enter into the spirit of the past, while in their daily life they hear the echo of a noble tongue which, "though dead, yet speaketh." They can acquire without difficulty a knowledge of modern Greek, and, without adopting the theories of those who hold that ancient Greek can best be taught through the medium of the spoken language, it must be admitted that even a moderate acquaintance with the latter is a distinct gain to the classical scholar. Many of the students return to England to engage in the instruction of others; they transfer the keenness of their appreciations to their teaching, which undoubtedly gains in thoroughness and efficiency. If the life, the thoughts, the deeds of the ancient Greeks had hitherto been made more of a breathing reality to the British schoolboy, we should perhaps hear fewer murmurs nowadays about "compulsory Greek."

While archæological study is more and more becoming an indispensable part of the outfit of a classical scholar, it is of great importance that promising young students should acquire, at first hand, so to speak, a real grasp of its present state and methods. In addition to such means of instruction as the excavations

already described, and excursions to places of importance in the neighbourhood of Athens, a twofold system of lectures has been adopted by the British School. The lectures may be described as esoteric and exoteric. The former, which are intended primarily for the students of the School, are delivered alternately at the School, or at some museum or on some site at Athens, the proceedings being of an informal nature, and varied by questions and discussions. The latter are more formal in character; papers giving the results of original study and research are read by the directors and the students; and members of the other archæological schools, as well as residents and visitors at Athens, are invited to be present. The attendance at these lectures, as a rule, is highly satisfactory, sometimes amounting to about fifty persons, of whom perhaps half are temporary sojourners at Athens. It should be mentioned that the labours of the students are not altogether confined to the classical period; two of them, for instance, are now occupied with a work of the greatest interest and importance on the Byzantine churches of Greece.

The British School not only furnishes instruction to all visitors at Athens who take an interest in Greek antiquities, but it also serves as a means of help and a centre for information to such of them as intend to travel in Greece. Its usefulness in this direction may be almost indefinitely extended in the future. The number of Englishmen who visit Greece increases annually, and at Easter-time last year there were perhaps more than fifty Oxford or Cambridge graduates and undergraduates at Athens, besides a host of other educated persons, English and foreign. When the railway now being constructed in north-eastern Greece is extended to Salonica, Athens will be brought into connection with the European railway system, and may possibly become the place of embarkation for the Anglo-Indian mail. A large influx of English visitors would follow, who would find Athens a more tempting resting-place than that very uninviting spot, Brindisi. There are some, indeed, who are sanguine enough to believe that the ancient "mother of arts and eloquence" may once more become an international centre of education when she finds herself on the high road between east and west. However this may be, it appears certain that the crowd of appreciative and cultured Englishmen will increase year by year at Athens, and that the British School of Archæology, in forming a centre-point for this learned society, will find its sphere of usefulness widening every day.

Unhappily there is a drawback to this pleasing prospect. The financial position of the School is not such as to warrant a very hopeful view of its future career. While the British Government declines to afford support such as is given to the French and German Schools by their respective Governments, the British School must depend upon the subscriptions of individuals for a somewhat precarious existence. Oxford, indeed, gives 100*l.* per annum for a period of three years, but the sister University has not yet followed the good example, though giving occasional grants to individual scholars connected with the School. The present total income of the School is below 450*l.* per annum, a sum which would scarcely suffice to form an adequate salary for the director. The expenses of excavations have to be met by special appeals for subscriptions, and, when showy or sensational results are expected, sufficient contributions are generally forthcoming. But such a system as this is fatal to sober, steady and conscientious work. If Government support must be despaired of, is it too much to hope that some wealthy patron of learning, some British Mæcenas, may yet come forward to rescue British archæological research in Greece from a position of disadvantage as compared with its French and German rivals? Though "pass Greek" may disappear from the Universities, there is no reason to apprehend a decline in higher Greek scholarship in England, more especially if young students are enabled to find a training of the utmost value, auxiliary to that of the University, in the pursuit of archæological study in Greece.

THE SOUTH KENSINGTON MUSEUM.

THE report of the Science and Art Department contains the following remarks on the Museum at South Kensington:—

The pressing need of additional space for both the science and the art collections of the South Kensington Museum has been frequently discussed for some time past, both in and out of Parliament, and has been the subject of a considerable amount of correspondence between the Science and Art Department, the Treasury and the Office of Works. The purchase from the Royal Commissioners of the Exhibition of 1851 in February last of the central portion of the southern galleries and of a large block of the adjacent ground will provide space for a building for the science collections in accordance with the recommendations of the Treasury Committee on the science collections, which reported in 1889, and the First Commissioner of Works has recently invited a limited number of architects to furnish designs for the completion of that portion of the South Kensington Museum which is on the land to the east of Exhibition Road.

Sir P. Cunliffe Owen, the director of the Museum, states that the number of visitors at South Kensington Museum was 831,460, and at Bethnal Green 402,989, during the year 1890, or a total of 1,234,449, which shows a falling off of 66,988 on the numbers in the previous year.

Art Museum.—The number of objects acquired for the Art Museum by purchase, gift, or bequest, was 927, of which 44 were for the Indian Section. The principal purchase during the year was a collection of examples of Italian art from Signor Bardini, of Florence, for 3,428*l.* This collection comprises an ancient Roman column of marble, carved with foliage; fourteen stone ends of steps, carved with animals, &c., from the Palazzo Gondi at Florence, commenced by Sangallo in 1490; a wall fountain, of the end of the fifteenth century, with carved foliage, dolphins and birds; a cabinet, decorated with intarsia work of the sixteenth century; a balustrade from Ferrara, with dwarf gilt columns on a decorated background, early sixteenth century; a niche for a statue, of carved wood and gilt ornament; a pair of doors carved with griffins in low relief; a "cuir-bouilli" comb case of the fifteenth century; a Della Robbia frame and base; and upwards of fifty examples of Italian sixteenth-century coloured and stamped leather. A carved-wood altar-piece, formerly in the sacristy of the church of S. Agostino, Piacenza, representing the Nativity, and above, the Crucifixion, with figures of the Virgin and holy women, mounted soldiers and groups of men and women, by an unknown artist of the sixteenth century, was purchased from Signor Favenza, of Venice, for 1,377*l.* Among the other purchases were two bas-reliefs of the Virgin and Child, Italian, fifteenth century, one of painted terra-cotta, the other of painted stucco (118*l.* each); and an Italian coffret of the fifteenth century, decorated with figures in gesso-duro (467*l.*); a long dividing shaft in inlaid bronze, from the doorway of a mosque at Broussa (140*l.*); and a Medici porcelain bottle (50*l.*). Two English seventeenth-century carved chairs and a painted tray from Florence, of the fifteenth century, were bought at the sale of the collection of the late Mr. W. Maskell. An English carved bedstead, dated 1593, with the arms of the Courtenays of Devon (357*l.*), and four carved English chairs, with the arms of Thomas Wentworth, first Earl of Strafford (48*l.* 6*s.*), were acquired at a sale at Turton Towers. Besides these may be mentioned a French Sedan chair, painted and decorated in the style of Louis XV., and a settee and chairs, English work of the last century (140*l.*); and several fine examples of Belgian, Italian and French lace (128*l.*). A Flemish tapestry wall-hanging, woven about the year 1520, with an allegorical subject, forming a portion of a set representing "The Seven Deadly Sins," was bought for 550*l.*, and a Persian carpet of fine design for 150*l.*

Amongst several important bequests and donations received have been a large iron grille, formerly in the cathedral of Constanz, of the date 1646, given by Mr. J. Starkie Gardner; an English harpsichord and an organ harpsichord, dated 1579, formerly in the chapel at Ightham Mote, near Sevenoaks, given by Mrs. Luard Selby. Mr. H. Martyn Kennard gave a tapestry-woven woollen tunic, found during excavations made in Egypt by Mr. W. M. Flinders Petrie, who has also presented specimens of similar work. The late Mrs. A. V. Jodrell having bequeathed the whole of her art collections to the Museum, a selection was made of about 150 articles, including examples of pottery, Wedgwood plaques, miniatures and bijouterie. A valuable and important collection of lace, bequeathed by the late Mrs. Bolckow, comprises fine examples of Venetian rosepoint, Brussels pillar lace and French needlepoint, a flounce of Brussels pillow lace, given by Madame de Maintenon to Archbishop Fénélon, and a priest's alb trimmed with a deep flounce of Venetian rosepoint. Some valuable articles of modern jewellery were also included in this bequest. The late Mr. Joseph Bond having died intestate and without heirs, his important collection of English plate of the last century, which had been lent to the Bethnal Green Museum, reverted to the Crown, but in accordance with the intention expressed to several friends during his lifetime to leave it to the South Kensington Museum, it was, by direction of the Lords Commissioners of Her Majesty's Treasury, handed over to the Science and Art Department. The Great Eastern Railway Company has presented the carved wood front and other portions of the recently removed house called the "Sir Paul Pinder," in Bishopsgate Street, built in 1600.

From Sir P. Cunliffe Owen's report it appears that the reproductions acquired in 1890 comprised 35 electrotypes, 99 copies of Italian medals, cast in copper and chased by Liard, and 117 plaster casts. Among the electrotypes are a copy of the bronze bas-relief of St. John, by Donatello, and 11 articles in metal selected from the Museum collections.

The additions to the collections of casts of the Italian Renaissance have been eight of the marble statuettes by Niccolo Pisano on the pulpit of the Duomo, Siena; four of the marble reliefs by Lorenzo Ghiberti on the tomb of San Zenobio in the

Duomo, Florence; a marble panel in low relief of the Virgin and Child in the Palazzo Panciatichi, Florence; and a relief in marble of cupids holding a wreath, in the church of S. Martino, Lucca, by Donatello; a relief in marble attributed to Rossellino, at Poggio Imperiale, near Florence; a relief in bronze of the Crucifixion, by Pollaiuolo; and a marble relief of the Virgin and Child, by Mino da Fiesole, in the Museo Nazionale, Florence. Of the works of Bendetto da Maiano, copies have been taken of a relief in marble of the Virgin and Child; three of the marble reliefs on the shrine of S. Bartolo in the church of S. Gimignano, near Siena, and a roundel in the same church of the Virgin and Child and cherub heads within a border of fruit and flowers. A pietà of marble in the church of Fontegiusta at Siena and a holy-water basin in the Duomo, Siena, by Lorenzo di Mariano, have also been copied. Casts have also been taken of the following works in terra-cotta :—The figure of a boy by Andrea del Verrocchio, in the Palazzo Vecchio; two kneeling angels by Luca della Robbia in the Duomo, Florence; a Della Robbia roundel of the Virgin and Child with cherub heads and a border of flowers, and a roundel with the head of a lady attributed to Andrea della Robbia, in the Museo Nazionale, Florence; and also three of the subjects of the frieze by Giovanni della Robbia on the Ospedale at Pistoia, coloured from the original. Copies of several important examples of French sculpture have been recently added. These include four of the niches of a doorway and two bas-reliefs, the Assumption and the Coronation of the Virgin in Notre Dame, Paris; the base of the Draper's Pillar in Rheims Cathedral; and a retable with figures of the Apostles and a Crucifixion in the church of St. Germain (Oise), all of the thirteenth century. Of works of later date are the rood-loft in Limoges Cathedral, erected in 1543; the doorway of the Hôtel Cujas, Bourges; a chimney-piece of the Hôtel Lallemant, Bourges, erected about 1572; an entablature of a chimney-piece by Jean Goujon, and several pilasters and other details of carved ornament from the Châteaux d'Anet and Blois. A reclining figure in high relief by Clodion, *L'Eté*, and a panel with the figure of *La Danseuse*, both eighteenth-century work, have also been acquired. A cast of Flaxman's statue of William Pitt, erected in Glasgow in 1812, has been made for the Department by permission of the Corporation of Glasgow. A copy in stucco of one of the arches of the Alhambra, made to scale and coloured by Don Rafael Contreras, has been presented by the Countess von Bothmer.

Mr. T. Armstrong, the director for art, reports that the pictures and drawings under his charge are in good condition, and that, as heretofore, full precautions have been taken for their preservation. Among the additions made by purchase to the historical collections of water-colour drawings by British artists during the past year, the first in quality and in costliness is a well-known work of the late J. F. Lewis, R.A., called *A School at Cairo*. Second only to this in importance is a drawing of *Crusaders on the March*, by Sir John Gilbert, R.A. In this a large number of small figures are represented in a landscape, and it illustrates the methods of composition and execution of the master in what many consider his happiest manner.

At the sale of the collection of the late Dr. Percy many very interesting examples of the earlier masters of water-colour art were acquired. Some of these artists were not before well represented in the collection, others not at all. In a few cases, although the Museum already possessed representations of an artist, another was bought on account of its great excellence and freshness. From this sale eighty-four works were added to the gallery, and in recent years no acquisitions from any single source by gift, bequest or purchase have gone so far towards completing the continuity of this most valuable historical collection. The late Miss E. Robinson, of Liverpool, bequeathed a good oil-painting, by Creswick, of *The Land's End*, and two pictures of Welsh landscape by Thomas Danby; also water-colour drawings by Carl Haag, A. D. Fripp and the late E. Duncan. An oil-painting by the late Thomas Heaphy has been presented by his widow, Mrs. Heaphy. Mr. Edwin Lawrence, who is not for the first time a benefactor to the Museum, has given nine portrait heads in crayon and pastel by John Russell, R.A., which illustrate in an interesting and valuable way the method of working in pastel of this well-known portrait artist. From Mr. Lindo Myers we have received a present of a portrait in sepia of the late Mr. Sheepshanks, by W. Mulready, R.A. The proprietors of the *Graphic* illustrated paper have presented a large drawing in tint executed on a wood block, of *Mounted Infantry at Aldershot*, by W. Small. It is an admirable specimen of the kind of work, and a welcome addition to the small collection the Museum already possesses of drawings on wood made for engraving.

Indian Section.—Mr. C. Purdon Clarke, the keeper, reports that the number of visitors to the Indian Art Collections during the year 1890 was 122,434, a slight decrease as compared with 1889. In the course of the year 283 objects were presented to the Museum, including the Burmese regalia, which has for some years been exhibited as a loan from the India Office. The bullion value of this collection was estimated to be 21,157*l.* 10*s.* The Museum has also received a collection of 112 Indian musical instruments, formed and presented by Rajah Sir Sourindro Mohun Tagore, Kt., Mus. Doc. Forty-four objects were purchased at a total price of 172*l.* 1*s.*; 232 objects have been received on loan, and three returned to the lenders; while 487 objects in 20 collections were issued on circulation to local museums, &c., and 16 collections (441 objects) were returned. In addition two important loan collections were issued, one of 176 objects, generally representative of Indian art, to the Bethnal Green Museum, and one of Indian metal-work and weapons (234 objects) to the exhibition of the Armourers' Company.

Art Library.—By the death, on June 20, 1890, of Mr. Robert H. Soden Smith, the Museum has lost one of its oldest officers. Mr. Smith had held the post of Keeper of the Art Library since 1866, having entered the Museum in 1857. His intimate acquaintance with many branches of art, and his readiness to give information were widely known and appreciated, and his loss very generally regretted. His successor, Mr. W. H. James Weale, who entered on his duties on August 22 last, reports that the attendance in the Art Library during the past year has been larger than in any of the three previous years, reaching to 27,561 as against 27,396 in 1889. The number of volumes and pamphlets acquired has been 266 presented and 1,452 purchased. Among these are some of considerable interest and great rarity; for example, John Erard Heiglen's "Gantz neue Erfindüngen unterschiedlicher Arten von Servicen," Augsburg, 1721; John Baptist Hagenauer's "Nouveaux desseins d'ornemens de meubles," Vienna, 1783, and Joseph Garcia Hidalgo's "Principios para estudiar el Arte de la Pintura," Madrid, 1691, copies of which are not to be found in any public library in England; and a volume containing outline engravings by Thomas Piroli of fourteen of Pippi's celebrated frescoes in the Villa Lante at Rome beautifully coloured by hand. 2,558 drawings, including a number of beautiful ornamental designs by Carter, and a collection of coloured drawings of badges and standards of noble families have been added, as also 2,370 prints, amongst which are 495 proofs on India paper of the woodcuts in Hone's "Every Day and Table Book." The collection of photographs has been increased by 6,721, chiefly of specimens of Italian art. 1,758 books, drawings, prints and photographs have been lent to the National Art Training School and other schools of art, &c.

A ROMAN VILLA.

A CORRESPONDENT of the *Lincolnshire Chronicle* writes: For some weeks past, remains of a Roman villa have been exposed to view by Mr. Ramsden's miners in the Greetwell Fields. From the extent of the tesselated pavements laid bare there is hardly any doubt that in the Greetwell Fields, in centuries long gone by, there stood a Roman mansion, which for magnitude was perhaps unrivalled in England. Six years ago I drew attention to it. The digging for iron ore soon after this was brought to a stand-still by the company, which at the time was working the mines, ceasing their operations. Then the property came into other hands, and since then more extensive basement floors of the villa have from time to time been laid bare, and from tentative explorations which have been just made, still more floors remain to be uncovered which may be of a most interesting and instructive character. What a pity it is that the inhabitants of Lincoln have not made an effort to preserve these precious relics of the grandeur of the Roman occupation, an occupation to which England owes so much. From the Romans the people of this country inherit the sturdy self-reliance and perseverance in action which have helped to make England what it is, and from the Romans too, in a great degree, does England also inherit her colonising instincts which impel her people to cover the waste places of the world with colonies. If the Roman remains which have been so abundantly discovered of late years in Lincoln and its vicinity had been collected and laid out for exhibition, they would have formed a most interesting collection of antiquities worthy of the town, and well worth showing to visitors who now annually make Lincoln a visitation. Although these relics of a remote age are being dug up and are being destroyed, it is not the fault of Mr. Ramsden, for he not only preserved them as long as he conveniently could, but he also had the soil removed from over them, and had them thoroughly washed, in order that people might have an opportunity of seeing their extent and beauty. One of these patches of pavement extended 48 yards northward from what might be called the main building, which had previously been broken up. This strip was 13 feet in breadth, and down its centre ran an intricate pattern worked in blue tesseræ. The pattern is much used in these days in fabrics and works of art, and is, I think, called the Grecian or Roman key pattern. On each side of this ran alternately broad ribbons of white and narrower ribbons of red tesseræ. There is also another strip of pavement to the south of the preceding patch, which has been laid bare to the extent of 27 yards. This patch is about 10 feet in breadth, and its

western portion is cut up in neat patterns, which show that they formed the floors of rooms. From the eastern extremity of these floors evidently another long strip of 48 or 50 yards still remains to be uncovered. Doubtless there are other remains beneath the ground which will be laid bare as the work of mining goes on. All these floors were not deeper than from 18 to 30 inches below the surface of the soil. The bones of animals and other relics have been found in the covering soil, and have been turned up by the miners from time to time. The pavement is all worked out with cubes, varying in size from an inch and a half to two inches square, each piece being placed in position with most careful exactness. The strip which extends 48 yards and is 13 feet wide runs due north and south. There is a second patch, running east and west, and this is 27 feet long by 10 feet wide, whilst a third is 27 feet long by 11 feet wide, this also running in a northern direction. To the north of this latter piece, and separated only by about two feet (about the width of a wall, which very possibly was the original division) there is a strip of tesseræ 16 feet wide, which had been laid bare 40 yards. It was thought probable that at the end of the last-named strip still another patch would be found. Mr. Ramsden, the manager of the Ironstone Works, is keeping a plan of the whole of the pavement, which he is colouring in exact imitation of the original work. This, when completed, will be most interesting, and he will be quite willing to show it to any one desirous of inspecting the same. Many persons have paid a visit to the spot where the discoveries have been made, and surprise is invariably expressed at the magnitude and beautiful symmetry of the work.

WESTMINSTER ABBEY.

THE following remarks by Mr. Shaw Lefevre, M.P., on the report of the Westminster Abbey Commission appear in the *Times*:—

The report is most satisfactory in two respects—the one that the Commissioners unanimously and most emphatically affirm the necessity of an addition to the Abbey, in which the long roll of monuments to illustrious persons, coming down to us from the earliest times, may be continued in future generations; the other that they urge the necessity of removing the unsightly houses in Old Palace Yard and Poets' Corner, which are a danger and a disfigurement to the Abbey.

It is disappointing, inasmuch as the Commissioners are evenly divided in opinion as between the two schemes for providing such additional space to the Abbey, one-half of them being in favour of a chapel on the site of the ruins of the refectory, the other of a chapel on the site of some of the houses in Old Palace Yard. If there had been unanimity on behalf of either of these schemes, the report would probably have been conclusive with the public, and would have formed, without further discussion, the basis of future action.

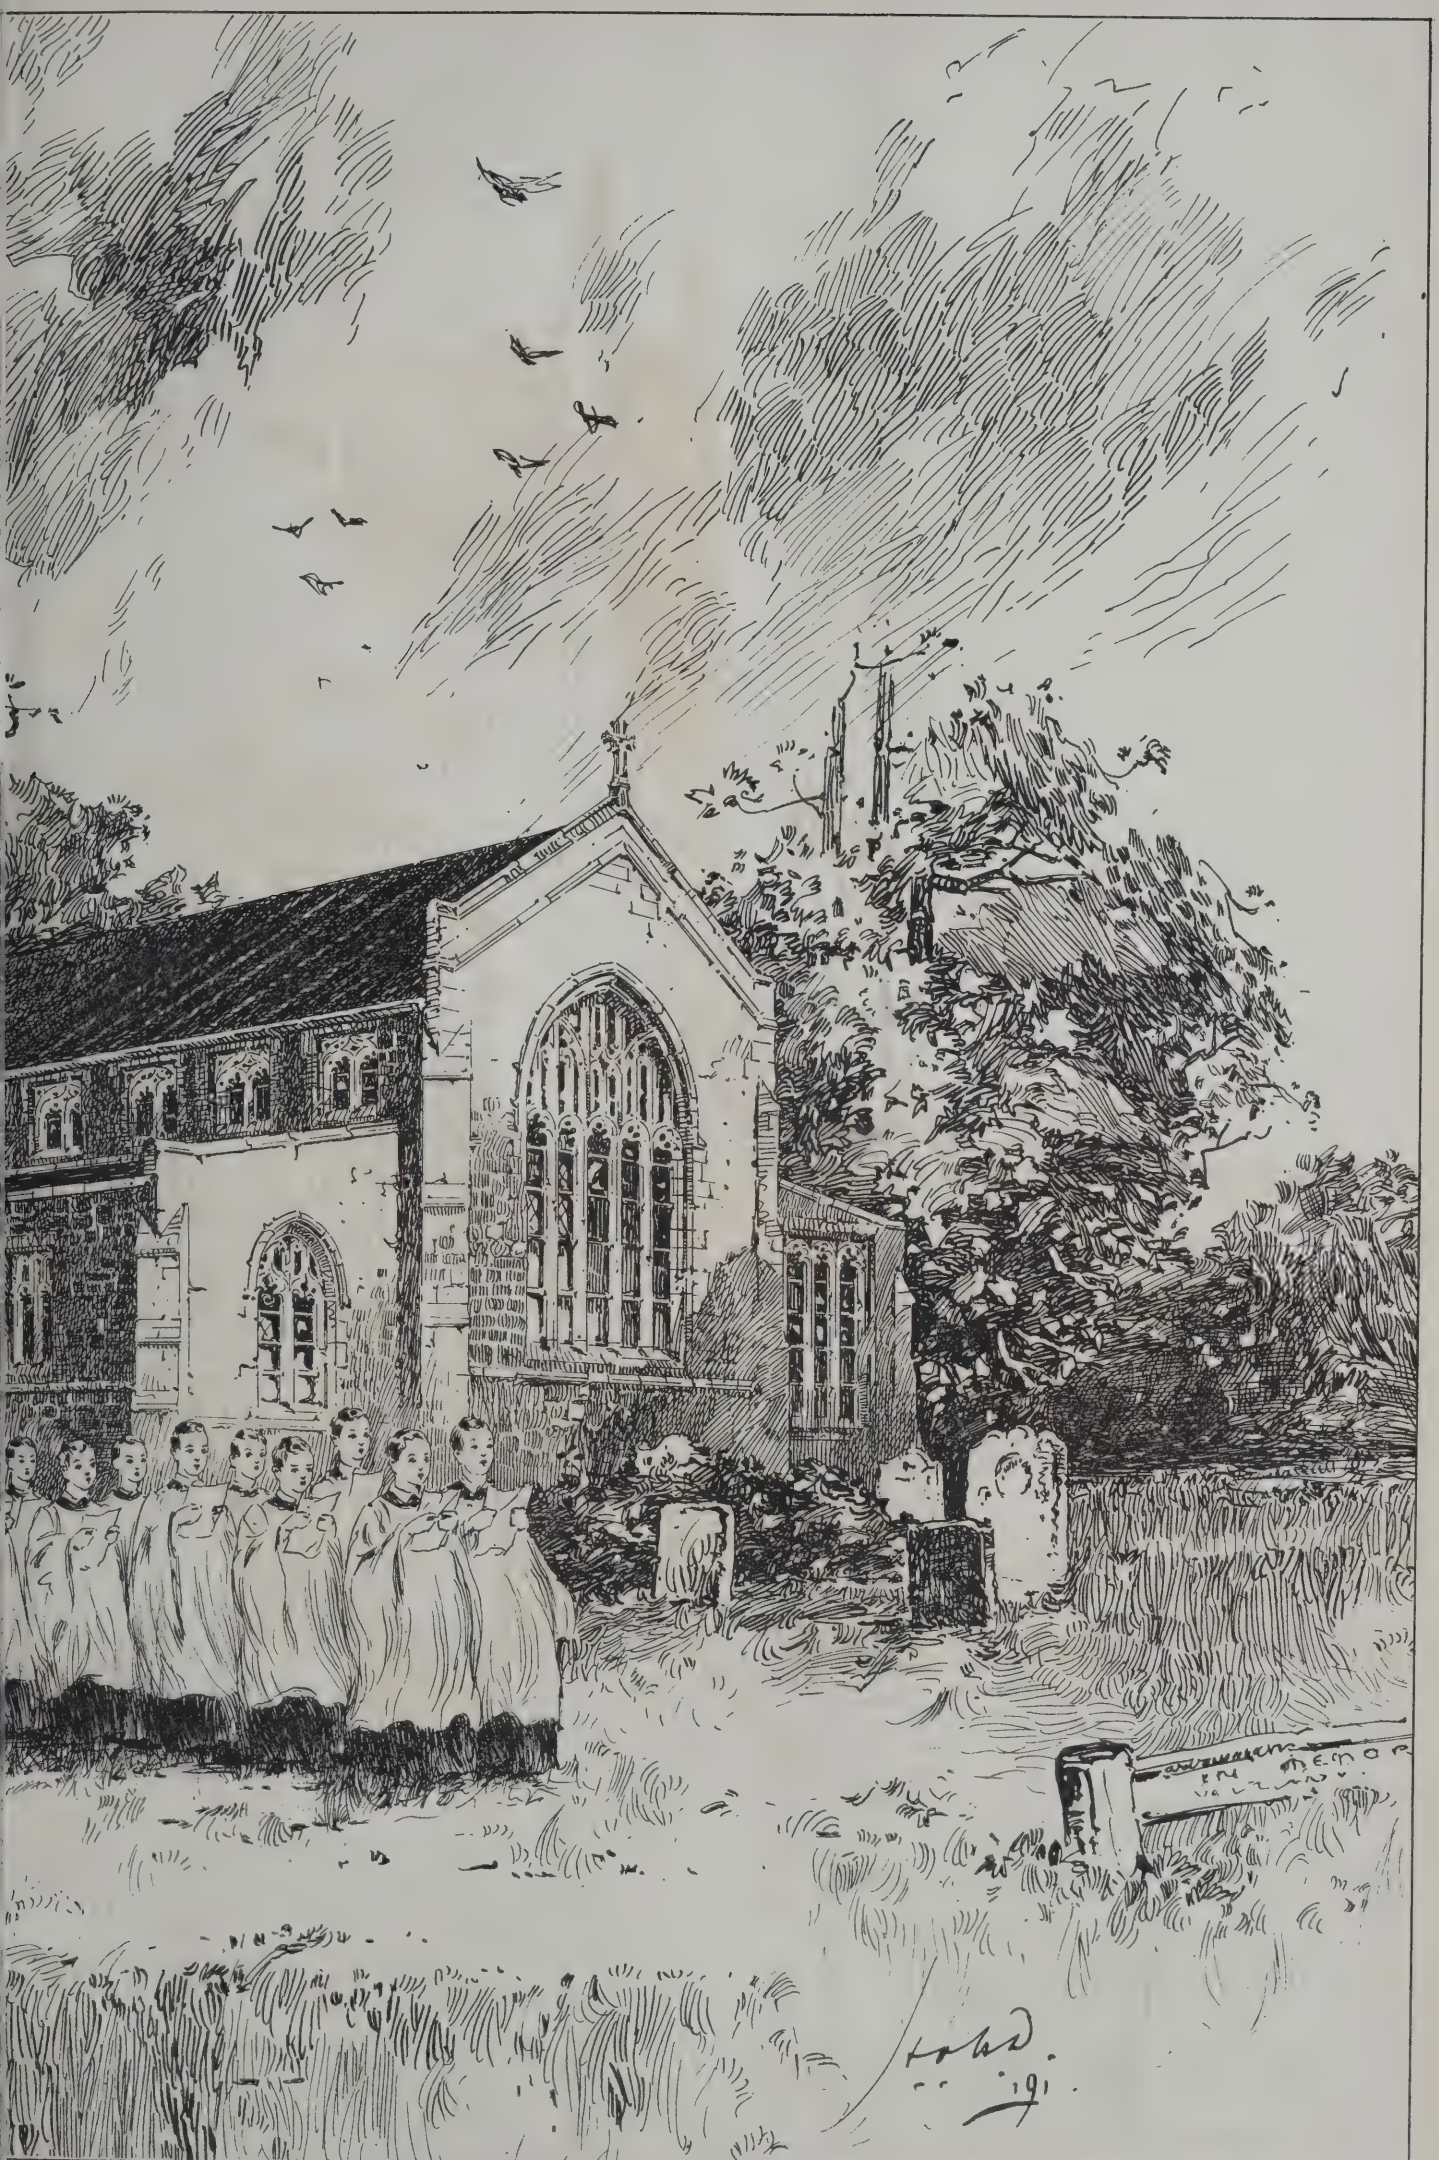
In view, however, of the evenly-balanced opinion of the Commissioners, the question must be decided by public opinion, and it will be well that the fullest information should be afforded the public before a conclusion is arrived at. The report is defective in this sense—for while it gives all the arguments which can be urged in favour of the refectory scheme and against the alternative, it is silent as to the reasons which induced one-half of the Commissioners to reject the refectory site and to prefer the other. This defect has been partly removed by the letter of Sir Henry Layard, stating shortly the reasons which induced him, the Dean of Westminster, and Sir Frederick Leighton to differ from their colleagues. This explanation, however, is insufficient as a guide to public opinion, in the absence from the appendix to the report of the designs which Mr. Pearson, the architect of the Abbey, laid before the Commission for the proposed chapel in Old Palace Yard, without which it is difficult for anyone to understand its relations to the Abbey and the extent to which it would leave open a view of the chapter-house and the south front of the Abbey.

An elaborate design prepared by Mr. Pearson at the request of the Commission for the interior of a chapel on the refectory site is given in the appendix. It is difficult, therefore, to understand why the drawings for the other scheme are not also given, and why the personal explanations of Mr. Pearson and his reasons for preferring this scheme, as given at the last meeting of the Commission, were not taken down by a shorthand writer and printed in the appendix.

Mr. Plunket, in reply to my question on this subject in the House of Commons, declined to produce these designs, but he said that he should have no objection to Mr. Pearson's making them public if he should wish to do so. I have since been permitted by Mr. Pearson to see these designs, and I am authorised by him to say that, when he has completed a further drawing, showing in perspective the proposed chapel and its relation to the Abbey and the chapter-house, he will take steps to make them public. In the meantime it seems to me it will be well that the public should reserve its final judgment as to the comparative merits of the two schemes. There are doubtless advantages, merits and difficulties in both of them, and it is only by a careful estimate of the balance of them that a conclusion can be arrived at. The main object to be aimed at is that the building, wherever placed, should be of dignity and stateliness not unworthy of the Abbey, and as closely attached to it as possible, so that it may be regarded as part of the Abbey, and that it should be capable of extension hereafter, whenever there should be demand for further space.

The chapel on the refectory site, as shown in the design by Mr. Pearson, would undoubtedly have a very pleasing interior. It would be 130 feet long by 37 feet wide, and it would have a stone roof. Its exterior, however, would not be visible from any point. This, strangely enough, appears to be considered as an advantage by some members of the Commission. Its defects are that it is removed from the Abbey by two sides of the cloisters; that there is danger that it might be treated rather as a lumber-room; that its north wall would be the existing remains of the refectory, dating from the time of Edward the Confessor, and, therefore, could not be interfered with; and that, in consequence of its narrow width, the chapel would be less suitable for the erection of monuments than a building with side chapels. The scheme will also be strongly objected to by the authorities of Westminster School, on account of its interference with Ashburnham House, recently acquired by them.

The chapel on the site of Old Palace Yard, as now suggested by Mr. Pearson, would consist of a nave with two aisles on either side, the nave 77 feet in height, the aisles 46 feet, the length of the building 103 feet. It would not be necessary that the whole of this building should be erected at present. The two northern aisles, with the cloister connecting them with the Abbey, would alone provide a space equal to that of the refectory chapel, and would suffice for many years to come. In this view it would be unnecessary to purchase or remove No. 5 Old Palace Yard, Mr. Labouchere's house, a point of importance from a Parliamentary point of view. The two aisles and their connections with the Abbey would cost about the same as the chapel on the refectory site, a little over 30,000*l*. The line of the new building would be 94 feet from Henry VII.'s Chapel, a distance which would open out very fully a view of the chapter-house. The aisles, being about the height of the aisles of Henry VII.'s Chapel, would not vie in any way with the main building of the Abbey. It is, however, only by inspection of the drawings that an adequate idea can be realised of the relation of this chapel to the Abbey and the chapter-house. In my humble judgment the main features of the building are exceedingly beautiful, and it would group well with the Abbey.



It was proposed in 1889 that the cost of the whole scheme should be borne jointly by the Government and the Ecclesiastical Commissioners, in whom the property of the Chapter of Westminster is vested, and by public subscription, and in this view a very influential committee was formed for the purpose of raising subscriptions. It will be matter for consideration whether this committee, or any other that may be formed, will be equally willing to make exertions to raise funds for a chapel on the refectory site. For my own part, while very much preferring the other scheme as more dignified and complete, I shall give whatever support is in my power to any scheme which may meet with general approval, and which shall achieve the main objects in view; and I am only concerned that the materials for forming a judgment should be fully before the public before a final decision is arrived at.

ROMAN REMAINS AT TWYFORD.

SEVERAL interesting fragments of Roman work have been brought to light in the course of excavations that are being made for building purposes at Twyford, near Winchester. About a month ago, a paved way, composed entirely of small red tiles, six feet in width and extending probably a considerable distance (a length of 14 feet was uncovered), was found while digging on the site for flints. The more recent excavations are 20 feet west of this passage, and there is now to be seen, in a very perfect state of preservation, an oven or kiln with three openings. Five yards away from this is a chamber about eight feet square, paved with tiles, and the sides coated with a reddish plaster. On one side is a ledge 15 inches from the ground, extending the whole length of the chamber; on the floor is a sunk channel with an opening at the end for the water to escape. This chamber evidently represents the bath. Portions of the dividing walls of the different chambers have also been discovered, together with various bones, teeth, horns and ornaments, but very few coins. It is probable that an alteration in the plans of the house which was about to be built on the spot will be made so as to preserve all the more interesting features of these remains in the basement. These discoveries were made at a depth of only two or three feet from the surface of the ground, and are within about a quarter of a mile of other Roman remains which were similarly brought to light a few months ago.

ST. CHAD'S CHURCH, WYBUNBURY.

THE church illustrated, consisting of nave, chancel and aisles, is to be erected on the site and in place of the old church now being demolished through failure in or rather want of foundations. The new church has been designed by and is to be built under the supervision of Mr. James Brooks, F.R.I.B.A., architect, of 35 Wellington Street, Strand, at a cost of about 7,000*l.* The old church was rebuilt, and the tower, which dates from the fourteenth century, brought back to its perpendicular in 1832.

THE brewery premises of Messrs. Leney & Co. cover an area of about three acres, and are mostly constructed of rubble walling and stone dressings. The illustration which we give this week shows a portion of the buildings used as offices, which has been recently erected by Messrs. Stiff, of Dover, under the superintendence of Mr. Henry Ward, architect, of Hastings.

ARCHITECTURE AND HYGIENE.

ON Tuesday Sir A. W. Blomfield, A.R.A., delivered an address as president of the architectural section of the Congress of Hygiene, in which he said :—

The title of this section, "Architecture in Relation to Hygiene," is clear and precise ; but it has, no doubt, occurred to many who have read it that it involves a question to which it is by no means easy to give a clear and precise answer—"What is the relation of architecture to hygiene?" The difficulty of answering lies in the uncertainty as to the strict limits of the functions and duties of the architect. If we take the usual definition of architecture as "the art and science of building," its relations to the science of hygiene at once become too varied and too complex to admit of clear and concise description. A vast field is at once opened out before us, in which it is often extremely hard, sometimes even impossible, to indicate with precision the line of demarcation between the domain of the architect and those of experts in other branches of science. As one out of many illustrations which might be cited of this difficulty, I may mention the wide and interesting subject of paving, which plays so important a part in the health, comfort and well-being of communities. This large question seems to occupy a kind of neutral ground between the province of the architect and that of the civil engineer. Many other similar instances might be given, but this one will be sufficient to show that the selection of subjects to be dealt with by this section must always be a matter of considerable difficulty. Directly scientific considerations are admitted side by side with the purely æsthetic aspect of architecture, it becomes hard to name a subject for discussion at a congress of hygiene which would not be as suitable for an engineering, medical or other scientific section as it is for that of architecture. For this reason I venture to throw out the suggestion that for some future meeting of this congress an extremely interesting and instructive paper might be written dealing exclusively with the points of contact between hygiene and the purely æsthetic side of architecture. This branch of a great subject remains up to the present time practically almost untouched, perhaps partly from the fact that to many minds the attempt to establish any such relationship appears fanciful and impractical. It is well known that one of the greatest of our English pioneers of sanitary science, the late Sir Edwin Chadwick, viewed the idea of any such connection with disfavour, and even with anger ; he seemed, indeed, to think that art and hygiene were not only unconnected, but even in some respects incompatible. Notwithstanding this decided opinion of a great and deservedly respected authority, I do not think it would be difficult to show that such a connection has, at any rate for certain minds and constitutions, a very real existence ; neither would it be hard to prove that, although never perhaps closely followed up or fully worked out in all its bearings, the idea of some actual relation between beautiful and artistic surroundings and health must have been present in the minds of many writers, both ancient and modern. Valuable hints and suggestions bearing on this subject may be gathered from a lecture delivered many years ago at the Royal Institution by Cardinal Wiseman, entitled "Points of Contact between Science and Art." Also from an address delivered by Mr. Wyke Bayliss, president of the Royal Society of British Artists, "On Sanitary Reform in Relation to the Fine Arts," at the Sanitary Congress held at Hastings in 1889. As might naturally be expected from such a source, it teems with beautiful and poetical thoughts bearing on the subject. But the illustrations, arguments and advice made use of are directed more to the influence of sanitary reform on the growth and development of art than to the effect of art on health—a more obscure, perhaps, but no less interesting subject, and the one I desire to see dealt with. Some years ago my friend Dr. B. W. Richardson, who stands in the foremost ranks of sanitary authorities, delivered a lecture upon it. He began by showing that much prejudice had been excited against some of the best sanitary inventions and labours, because leading sanitarians have failed to consider artistic construction as part of sanitary construction ; their whole minds have been absorbed in the useful, and they have permitted all that is ornamental to pass by, as if good taste were disconnected from sanitation. He argued that this was a grand mistake ; that ugliness was an offence to good health, and that beauty was an aid to the best health. He showed that when mind and body are enfeebled by bad health the introduction of disagreeable objects into the sick room or ward is painful and injurious to the occupants ; whilst the presence of beautiful flowers, pictures and designs is curative in its effects—a kind of mental tonic which gives tone also to the body. This thought led him to the consideration of the best forms for hospital wards having regard to the effect on the eye, and through the eye on mental and bodily health, and so with all the details of visible construction and of decoration. Speaking of the dwelling-house, he maintained that no part ought to be excluded from the possession of architectural art, because it is the tendency of the human mind to let that which is disagreeable, plain and ugly go without regard, and accumulate dirt and disorder. Hence all the offices of a house should have as much care bestowed on them as the living rooms to render them bright and cheerful, and to make cleanliness as obvious a necessity in one as the other. In this lecture Dr. Richardson made a great point of the treatment of floors, adverting particularly to the ancient Roman mosaic floors, which were not only beautiful works of art, but easily cleaned, and by the well-known hypocaust system of warming diffused an equable and agreeable warmth through the room, without draughts. Other points especially dwelt upon were the treatment of roofs and the introduction of artistic water fountains in different parts of the house. No one could be found better qualified than Dr. Richardson to speak with authority on both the æsthetic and the scientific aspects of the question, "What is the relation of architecture to hygiene?" but even when writing in the interests of art he is naturally first of all a man of science, and I should like to see the same subject dealt with by an architect from an artist's point of view.

RESPONSIBILITY FOR VALUATIONS.

ON Tuesday Lord Justice Fry delivered judgment in Vennell *v.* Meakin, an action which raised questions of considerable interest to surveyors and valuers. It was brought by a gentleman who in July 1889 advanced a sum of 500*l.* upon the security of a second mortgage of some houses at Carshalton. The defendant was Mr. Frederick Meakin, a surveyor carrying on business in the City of London under the style or firm of W. F. Meakin & Son. He valued the property in question prior to the making of the advance, and, as the plaintiff alleged, with a view thereto.

According to the *Times* report, the plaintiff claimed compensation from the defendant by way of damages for loss sustained by the plaintiff in consequence of the property being proved to be an insufficient security, "by reason" (as the plaintiff alleged) "of the negligence, want of skill, breach of duty, and misrepresentation of the defendant with reference to a valuation and report" made by him. The property in question consisted of nine houses called Alexandra Terrace, in Stanley Road, Carshalton, which belonged to Mr. T. N. Ward, and there was evidence that the property was known in the neighbourhood as "Jerusalem" or "Abraham's bosom." Seven of the houses (those numbered 1 to 7) were subject to a prior mortgage for 1,500*l.* to a Mr. Coatt. The negotiations which led to the making of the plaintiff's advance were conducted through his then solicitors, Messrs. Sole, Turner & Knight, who employed the defendant to value the property. He had on April 20, 1889, on the occasion of the former mortgage, made a report and valuation as regarded the houses Nos. 1 to 7. This report was sent by Messrs. Sole & Co. to the plaintiff for his perusal. In this report the defendant said, "In obedience to your instructions we have made a survey of Nos. 1 to 7, which

are offered as security for a loan by way of mortgage, and beg to report as follows." The report stated that "the property is leasehold, for a term of ninety-nine years from March 1888, subject to a ground-rent of 7*l.* each house." The report gave a detailed description of the houses, stating (*inter alia*), "No. 1 is let on a three years' agreement, at 35*l.* per annum for the house and 15*l.* for the shop, to Mr. Collard. Mr. Ward offers all the other houses at 35*l.* per annum each, and at such rentals he should be able to let them readily, since they are in a nice position, within a mile of the station. . . . We understand Mr. Ward has arranged with tenants for some of the other houses. . . . So far as we can see, this part of Carshalton is evidently on the improve by the number of houses which have recently been erected in the immediate neighbourhood. Our valuation of the houses is equal to 2,600*l.*" On July 9, 1889, Messrs. Sole & Co. wrote to the defendant as follows:—"Referring to your report of April 20 last, and to our recent interview with you in reference to a further advance upon this property, we write to say that we have found a client who is willing to lend 500*l.* more (as required by Mr. Ward) upon the security of a first mortgage of 8 and 9 Alexandra Terrace, and a second charge on Nos. 1 to 7, provided you can report to us that it is a sufficient security. Having regard to the amount at which you value the seven houses, which are in mortgage to Mr. Coatt, it looks as if you would be able to advise the advance, although we hear that Nos. 8 and 9 are both still empty. We do not know whether you will require to go down to Carshalton again, but if so, perhaps you had better communicate with Mr. Ward, otherwise kindly send us a supplementary report at your earliest convenience." On July 12, 1889, the defendant sent to Messrs. Sole & Co. a further valuation and report, in which he said:—"When we made our survey in April last we viewed the whole of the terrace, and had Mr. Ward's instructions to take as many as we thought right to do for the security of the 1,500*l.*, he, however, offering Nos. 1 to 5, both inclusive. We, as you will remember, included under this charge Nos. 1 to 7, both inclusive, which we valued at 2,600*l.*, and our valuation of Nos. 8 and 9 (all the houses being similar, save No. 1, which has a shop in front) we estimate at 690*l.* This, taking the whole terrace as equal to 3,290*l.*, and allowing the usual two-thirds, would allow of a further sum of 500*l.* being advanced." This further valuation and report was communicated by Messrs. Sole & Co. to the plaintiff, and, in reliance (as he alleged) on the accuracy of the statements and estimate of value therein contained, he advanced to Ward a sum of 500*l.* on the security of a mortgage dated July 26, 1889, of the nine houses, subject as to Nos. 1 to 7 to the prior mortgage for 1,500*l.* The security has proved to be of little or no value. The plaintiff has received nothing in respect of his security except one half-year's interest, and Ward has become bankrupt. The plaintiff had also been obliged to pay considerable sums for ground-rent and insurance. By his statement of claim the plaintiff made allegations to the following effect. In making the further valuation and report the defendant had express notice, and was well aware that the same was required for the purposes of a proposed advance, and in order to enable the plaintiff, as the intending mortgagee, to determine whether he should advance any (and what) sum on the security of the premises, and that the valuation and report of April 20 had been, or would be, communicated to the plaintiff as such intending mortgagee, and the defendant made the further valuation and report, intending that the same should be communicated to, and that it and the former valuation and report should be acted upon by, the plaintiff as such intending mortgagee. Under these circumstances it was the duty of the defendant to use, and he in fact contracted with the plaintiff to use, due and proper care, skill and diligence in making the valuations and reports. The defendant knew, or without gross negligence must have known, that the premises were not worth 3,290*l.*, or anything like that sum, and the defendant in making the valuations and reports did not use due and proper care, skill and diligence, but the statements therein respectively contained were either false to the knowledge of the defendant or were made recklessly, without caring whether they were true or false, and in breach of his duty to the plaintiff. The plaintiff had been advised that if the premises were now put up for sale they would probably not realise more than 500*l.* altogether. The plaintiff further alleged that the original valuation and report contained serious misrepresentations of fact, in addition to the excessive estimate of value. The report did not state (as the fact was) that the houses were erected upwards of fifteen years prior to the date of the leases. The houses were not "fairly built," but were in fact very badly built, and were at the date of the report in a most ruinous and dilapidated condition. No. 1 was at the date of the report let to Mr. Collard on a parol weekly tenancy, at a rent of 10*s.* per week, and not on a three years' agreement at the rents in the report mentioned. None of the other houses had been let since and for many years prior to the date of the mortgage. The position of the property was not a "nice" one, as stated in the report, but was in the middle of ploughed fields, and out of seventy-two dwelling-houses in the immediate neighbourhood not more than half a dozen were let. There were no first-class houses in the immediate neighbourhood. By his defence the defendant denied most of the plaintiff's allegations. He denied that the plaintiff advanced the 500*l.* in reliance upon the reports, or either of them. The defendant denied that in making the further report and valuation he had express notice, and was well aware that the same was required for the purpose of a proposed advance, and to enable the plaintiff, as the intending mortgagee, to determine whether he should advance any, and what, sum on the security of the premises, or that the valuation and report of April 20, 1889, had been, or would be, communicated to the plaintiff as such intending mortgagee. The defendant denied that he made the alleged further valuation and report intending that the same should be communicated to, and that it and the valuation and report of April 20, 1889, should be acted upon by, the plaintiff as such intending mortgagee, as aforesaid. The defendant denied that it was his duty to the plaintiff under the alleged circumstances, or at all, to use, or that he in fact contracted and agreed with the plaintiff to use care, skill and diligence in making the valuations and reports. The defendant further said that he did in fact use due and proper care, skill and diligence in making the several valuations and reports, and that the statements made by him in the valuations and reports were true, and that he made the same with due skill and *bonâ fide* believing the same to be true. The defendant denied that the original valuation and report contained serious or any misrepresentations of fact; that as to the particular misrepresentations referred to in the statement of claim, he made the same after inquiry and upon information received, and *bonâ fide* and without negligence, believing them to be true. The defendant further said that if any of the representations so made were incorrect, the plaintiff himself or by his solicitors had possession of the title-deeds and other documents and information relating to the premises, and knew, or ought to have known, the correctness of such representations, and that, with regard to any such representations, neither the plaintiff nor his solicitors ought to have relied, or did in fact rely, on such representations.

Lord Justice Fry, after fully stating the facts of the case, and reading and commenting upon the correspondence and the two reports of April and July, 1889, made by the defendant, said that the first question to be decided was whether the plaintiff did employ the defendant to make the valuation. As to that question, his lordship was of opinion on the facts of the case that the defendant was engaged to advise the mortgagee and not the mortgagor. There was nothing to show that he was to advise the mortgagor. He knew that a person was desirous of making an advance on the property, and he was expected to advise that person as to the value of the security offered. His lordship therefore held that there was such a contractual relation between the plaintiff and the defendant in this case as that, if the tables had been turned, the defendant could have claimed from the plaintiff a reasonable fee for having performed the work for him. The second question was whether the defendant had negligently performed the work which he had undertaken to do for the plaintiff. Was there negligence on the part of the defendant in the way in which he had performed his duties? It was impossible to separate the two reports which the defendant had made, because the report of July was supplemental to the report of April. The history of the property was this. (His lordship discussed the facts relating to the property.) There was a colony of houses lying out in the open fields in a decaying and dilapidated condition. For ten years down to 1889, with the exception of the house at the end of the terrace, not a single house had been let. For more than ten years the other houses in the terrace had been entirely unoccupied. When the defendant visited the property in April 1889 he saw the condition in which the houses were, and he made the report of that date. It was not in dispute that that report proceeded on the footing of the houses being likely to let at 35*l.* per annum each. He must have known, however, that unless the houses were put into repair not a single one of them would be occupied. The question was, Were they likely to let? It was useless to estimate the rental unless it was possible to obtain tenants to occupy the houses and pay the rents. It ought to have put the defendant on his guard and led him to inquire into that point, to ascertain whether there was any probability of the houses being taken. The defendant ought to have addressed himself to that. But he did not do so. He assumed that the rent of each house would be 35*l.*, notwithstanding that the houses had been empty for ten years, and were still empty when he made his report. No one would take the houses in their dilapidated condition. His lordship did not think that the defendant was actuated by any improper motive in what he did. It was rather for what he did not do that he was to blame. It was his want of vigilance in the matter that was to be complained of. His lordship did not think that any person ought to have seen those houses, and not made inquiry and pressed for information concerning them. His lordship thought that the defendant had not done all that he

could have done. Then came the report of July 1889. It appeared to his lordship that the advice given by the defendant in April 1889, was given in expectation that the houses would let later on. But July came round, and still the houses had not let. Were not these important facts for a prudent surveyor to consider when he was advising that money should be advanced on those houses? In July the defendant did not go to Carshalton again to see the property. He did not deem it necessary to make any inquiry whether any of the houses had let since he visited the place in the preceding April. His lordship thought, therefore, that there had been decided negligence on the part of the defendant, but not more than negligence. The result was that the plaintiff was entitled to be repaid the 500*l.* which he had advanced on the faith of the defendant's reports, together with the unpaid interest on the mortgage, amounting to 37*l.* 10*s.*, and the costs of the action. On the defendant undertaking to pay those sums within ten days the order would not be drawn up until October, when there would be liberty to apply to his lordship before the order was drawn up on the question whether there should not be instead an account as between mortgagor and mortgagee, and the defendant to have a transfer of the mortgage.

THE ROYAL ARCHÆOLOGICAL INSTITUTE.

THE annual meeting of the Royal Archæological Institute of Great Britain and Ireland was opened in Edinburgh on Tuesday. Earl Percy, president of the Institute, took the chair, and congratulated the members on their meeting in Edinburgh. He said he came from a part of the country from which visits to Scotland in former times were not infrequently made, and they had had no cause to complain of the warmth of their welcome. He had peculiar pleasure in heading another inroad into Scotland in happier times, when his followers desired to carry away nothing but what their hosts were only too willing and able to give—gratification and instruction from the expeditions which they were to join during the week. In vacating the chair in favour of Sir Herbert Maxwell, he paid a high compliment to his researches in archæology.

Sir Herbert Maxwell, on taking the chair, thanked the Institute for the honour they had done him. The closing years of a century, he said, naturally suggested the process of stock-taking, and as they had arrived at the last decade of a century which claimed to have witnessed beyond all precedent the accumulation of scientific knowledge, it was not unnatural that they should direct inquiry into the standing obtained by that particular branch of science in which they were all concerned. The comparison was made the more easy by a landmark placed halfway nearly between the two periods—the present time and a century ago—viz. the last meeting of the Institute in Edinburgh in 1854. In making the comparison they had no reason to blush. It was in the year 1816 that the third of the Waverley novels, "The Antiquary," was published, in which the antiquary of the time was sympathetically delineated. No one had ever shared more keenly the ardour of collection and investigation than had Sir Walter Scott. It was not uninteresting to compare the motives of two men who, although vastly dissimilar in many points of their character, yet coincided in others. Sir Horace Walpole left the scene just as Sir Walter Scott entered upon it. Walpole collected antiquities because of their beauty. In his eyes art gave the primary merit, and association only the secondary. Scott, on the other hand, prized each object chiefly on account of its origin and the associations connected with it. Each was pre-eminent in his way—Walpole as a *dilettante* and Scott as an antiquary; and it was their privilege in the present day to follow a higher aim than either Walpole or Scott—the attainment of the truth. Without that object the whole science and scheme of archæology was a nameless fabric. The Scottish antiquaries had collected within the building a whole host of silent witnesses of the past which bore testimony to the origin of their race and the development of their civilisation. It was neither for the gratification of taste nor from romantic considerations that that collection was brought together. It was their desire to know and understand the past history of their race, without which it was impossible either to understand or control the present or to forecast and direct the future. He did not depreciate the work done by Sir Walter Scott. He yielded to no one in his love for the man and in admiration for his work. It was impossible to calculate how many minds he had drawn into the field of archæology, but the impetus which he had given to it would have been but transient had it not been submitted to the method and system which were found indispensable to all science, namely, the comparative method which distinguished modern science from Mediæval study. There was implanted in the human breast that craving for knowledge which, showing itself in the savage by a restless curiosity, swelled under civilisation and culture for the truth and a divine hatred of error. He had always held archæology was the handmaid of history, that it was an important branch of not the least important section of physical science, anthropology. More than anything else, it convinced them of the unity of the human race. Primitive instruments, primitive dwellings, burial places and utensils in all parts of the world bore a striking similarity to one another. Everywhere there was evidence that man in his primitive condition, subjected to similar circumstances, and having to contend with similar difficulties, had adopted similar means to overcome them. It was not only to tickle their vanity that they compared the water canoe, found perhaps in a Highland lake and hollowed out of a single oak trunk, with the modern ironclad. It tended rather to their humility when they reflected that between these two masterpieces of naval engineering there was perhaps interposed a space of twenty centuries. Sir Herbert then dwelt on the importance of collectors labelling at once every object with the name of the place where it was found, and, in impressing upon antiquaries not to disregard local traditions, he stated how St. Ninian's Cave, on the shore of Luce Bay, had been ascertained to have been a place of religious occupation fourteen and half centuries after its occupation by St. Ninian simply by local inquiries made to ascertain the truth of the legend. It would, he said, go far to free antiquaries from the ridicule and good-natured contempt which business people sometimes exhibited towards them if they were seriously to inquire into these traditions, discarding what was false and confirming what was true. One of the problems which was pressing upon antiquaries in several parts of the country at the present time was that relating to those mysterious rock sculptures which from time to time were found in increasing numbers all over Scotland. They bore a striking resemblance to similar rock sculptures found not only in Scandinavia and Central Europe, but in such remote parts of the earth as Asia, and Northern, Central and Southern America. They could hazard no guess even at the race by whom they were made, still less at the object of their authors. All they could do was to record the discovery of them with careful drawings, and wait till perhaps light would flash upon them from the habit of some uncivilised tribe or from a passage in some hitherto unnoticed writer. In conclusion, Sir Herbert explained to the Congress the circumstances under which the Antiquarian Society came to have its museum in the building, and in the name of the Society and of the Scottish nation he offered to Mr. John R. Findlay their grateful thanks for his munificence.

Dr. John Evans moved a vote of thanks to Sir Herbert Maxwell for his address, and expressed on behalf of the Institute and of the English nation their gratitude to Mr. Findlay.

In the afternoon the members visited Holyrood Palace, under the guidance of Mr. W. W. Robertson, of Her Majesty's Board of Works.

GREEK SCULPTURES.

A CORRESPONDENT of the *Manchester Guardian* writes:—An interesting discovery is reported from Athens. In the works connected with the extension of the Athens-Piræus Railway a few months back there was found at a spot north-east of the Theseion a square block of Parian marble, which had formed the base of some dedication. On the front is an inscription recording as follows:—"In the cavalry sham fight these commanders of squadrons (*Phylarchi*) won: Demainetos, son of Demeas; Demeas, son of Demainetos; Demosthenes, son of Demainetos. All of the deme Paianieus. Bryaxis made me." On each of the three remaining sides is sculptured in relief a tripod and a bearded horseman. Judging from the remains on the upper surface, this base seems to have supported a small Ionic column, on which probably stood the tripod of bronze or silver which commemorated the victory. This has of course perished, but in the reliefs on the base we are fully warranted in recognising the work of Bryaxis's own hands. It was a regular practice among the great Greek sculptors to decorate their own bases, and moreover the excellence of the work fully justifies this attribution here. The discovery is the more important because nothing has hitherto come down to us which could be definitely connected with this celebrated artist. That his reputation as a sculptor was considerable we know from the general testimony of antiquity, and also from the fact that he was chosen with Skopas and Leochares to decorate the mausoleum at Halicarnassus. Bryaxis was an Athenian, but, judging from the record of his works, must have spent much of his life in Asia, as we hear of him at Rhodes, Knidos, Antioch and Patara in Lycia. In all probability, then, his work at Athens must have taken place before his work on the mausoleum—that is to say, shortly before 350 B.C., and this date would suit the characters of the inscription and the style of the sculpture. The three horsemen are evidently portraits of the Phylarchi whose names are recorded; one figure seems to be older than the others, and is probably intended to represent Demainetos, the father of Demeas and Demosthenes. The formation of these three

names recalls a practice familiar to the Greeks of the best period, in which the family names usually ring the changes on one or two compounds of words. Here the names are all compounded with Demos. One is naturally reminded of the fact that the great Athenian orator was Demosthenes, son of Demosthenes, and belonged to the same deme Paianieus. If the sculpture of Bryaxis is correctly attributed to about 355 B.C., the orator must have been when this was executed exactly thirty years old, and may very likely have witnessed the cavalry manœuvres in which his relations were successful.

MANCHESTER ARCHITECTURAL ASSOCIATION.

ON Saturday, the 8th inst., about forty members and friends visited the Jesse Haworth Memorial Church, recently built and endowed at Walshaw, near Bury, in Lancashire, by the sister and nephew of the deceased gentleman whose name it bears, who, during a long life, was the centre of a homely and successful industrial community. A more detailed description of the edifice is reserved until nearer the date of consecration. Its exceptional features are the thoroughness with which every part of the structure has been carried out in the most durable materials, and the large amount of memorial glass of excellent quality by which the interior is adorned. Mr. Arthur J. Dix, of London, is responsible for the east window of chancel, and Messrs. Cakebread, Robey & Co., of London, for the two side-windows of chancel. Mr. William Pape, of Leeds, has executed the large west window of seven lights, the north transept window of four lights and three nave windows of three lights, and is engaged on two others for the main porch. The windows have been erected by members of the Haworth family and others, and were greatly admired by the members of the Association. They are part of a complete scheme laid down by the architects for the illustration of the birth, life, death, resurrection and ascension of Our Lord, to whom the church is dedicated, and of his works and parables. The church was designed by Mr. L. Booth, F.R.I.B.A., and has been carried into execution under the supervision of Messrs. Booth & Chadwick, of Manchester. After the inspection the visitors were invited to tea at the Derby Hotel by Mr. and Mrs. Booth, and an agreeable evening was spent.

PALESTINE EXPLORATION.

THE annual report of the general committee of the Palestine Exploration Fund states that the main work of the past year has been the excavations at Tell el Hesy. Some delay occurred in resuming the work. Mr. Flinders Petrie's old love for Egypt was so strong that the committee had to look afield for a fresh explorer. It was no easy matter to find one suitable, so many qualifications combined in one man are necessary. Mr. Bliss, the son of the president of the American College at Beirout, being highly recommended by the Rev. Dr. Post for the position, was appointed, and proceeded to Egypt, where he underwent a course of instructions with Mr. Petrie in conducting excavations. In February he arrived at Jaffa, and at once began arrangements for starting work.

Herr Schick continues to report on all newly-discovered objects in or near Jerusalem. His endeavours to find the continuation of the rock-cut channel south of the Virgin's Fountain were at last rewarded by success, though not before sinking several shafts over 30 feet in depth. On striking the channel, which is partly a rock-cut tunnel, he followed it for over 200 feet. What this channel or drain belongs to, or where it comes from or leads to, has not yet been decided. Unfortunately, the work was put a stop to by order of the Governor, owing, it is thought, to the lamentable removal of the Siloam inscription, which has roused the suspicions of the Turkish authorities. Every one interested in the archæology of Palestine will have learned with regret that this famous inscription was cut out of the rock tunnel and carried away some time during last year. It was broken in removal, and the fragments sold to a person in Jerusalem. On receiving this intelligence the executive committee immediately forwarded to his Excellency Hamdi Bey a resolution expressing their regret and their hope that steps would be taken to secure the fragments. A few weeks later Mr. Kayat, Acting British Consul at Jerusalem, reported that through his endeavours the inscription had been recovered and handed over to the Turkish authorities for transmission to Constantinople. About the time of the removal of this inscription another "Siloam inscription" was produced, and copies of it sent to several persons. It is a clumsy forgery in seven lines of Phœnician characters.

Among the more important discoveries of the year are:—An elaborate rock-cut tomb, and an ancient bath and cistern near Bethany. Some fine mosaic work in three colours at the so-called "House of Caiaphas." Another rock-hewn chapel with a Greek inscription at Silwân. The springing of an arch in "Solomon's Stables" by Mr. Lees. The lower masonry and the part of the arch left are similar to Robinson's Arch, and the fragment of an arch near the south-east corner. Herr Schick and Mr. Lees sent some squeezes and tracings of Hebrew inscriptions and ornamentation found on some ossuaries that were deposited in rock-hewn tombs lately opened up north of the city, on the west side of the Damascus road. These were forwarded to Professor Clermont-Ganneau, who has contributed valuable notes respecting them.

Herr Schumacher, acting on instructions from the committee, proceeded to Kana, a village east of Tyre, and photographed and examined the sculptured figures mentioned by Guérin and Renan. No inscriptions were found. Major Conder believes the figures to be of the Roman or Greek period.

BARRY'S PUBLIC BUILDINGS IN LONDON.

THE latest number of the *Edinburgh Review* contains an elaborate article on "London Architecture in the Nineteenth Century," which is sufficiently comprehensive to serve as a guide to strangers in search of modern work. The change in architecture is traced from the beginning of the century. The following extract relating to some of Sir Charles Barry's work at Westminster will suggest the competence of the writer to treat of architecture:—

In our notes on the new architectural era of London, we cannot commence better than by retracing our steps to Westminster and considering the architecture of the most important and celebrated building of modern London. It was on the night of October 16, 1834, that Charles Barry, already known to many as an architect of exceptional ability, but who had not then achieved any very extended fame, was returning from a professional visit in the country, when he saw the glare in the sky indicative of a great fire. He hurried to the place, and remained the whole night watching the burning of the Houses of Parliament, perhaps not without dreams of what he might produce to replace them. An official rebuilding was at first all that was thought of, and Sir Robert Smirke had even been desired to make plans for this; but the strong public feeling that this was a great opportunity prevailed, and eventually, in June 1835, a committee of the House of Lords settled the terms of a competition, allowing only six months for maturing the designs, and ruling that the style of the proposed building was to be "Gothic or Elizabethan." No fewer than ninety-seven designs were sent in, and for all those who went into it with a serious intent to be winners the labour and mental strain in producing an adequate plan and design within the time allotted must have been enormous, as in Barry's case we know that it was. After some delay his design, which had attracted much notice from competent judges from the first, was definitely adopted. As everyone knows, Barry had selected the style of Late Gothic prevalent in the reign of Henry VII. in preference to the mixed style connected with the name of Elizabeth, in which the last relics of Gothic are blended with the rising spirit of Renaissance detail, and as one or other style was forced upon him, there is no doubt he did wisely in selecting for such a building that which was still a complete style, coherent in all its details. However well the picturesque quality of Elizabethan architecture may be adapted to a private mansion, it wants the elements of breadth and consistency requisite for the dignity of a great public edifice. Had Barry been left free to do as he liked in regard to the architectural treatment of the Houses of Parliament, there cannot be a doubt that he would have based his design on the Renaissance style, and that, working in accordance with his own special gifts and architectural sympathies, he would have produced a much finer building, and one more in keeping with the spirit and with the practical requirements of the present day.

Even as it stands, however, London may well be proud both of the building and of its architect, who was a Londoner, and born in Westminster (in 1795) on a spot close to the site on which he was afterwards to rear the structure with which his name will always be connected. Barry was one of those men who may be said to have been a born architect, gifted with that peculiar faculty for perceiving what can be made of a site and of a plan, both in a practical and artistic sense, which is something quite distinct from the mere production of pictorial architecture. He was the only architect who has risen to fame in modern England who combined in an equal degree practical knowledge and ability with artistic perception. He was a master of planning; he disdained no practical details, and he had that delicate perception of proportion and refinement in design which enabled him to leave the stamp of architectural grace and dignity upon everything he touched. In regard to the Houses of Parliament, the character of the detail was fixed for him more or less by the style adopted, and had he chosen his own style we should no doubt have had a building less florid in detail, and with more of the effect obtainable from the con-

trast of decorated with undecorated wall-surface. As it is, no doubt, the building is over-rich in detail. Apart from this, there is little but praise to be given to the building. Its low position is unfortunate, but for that also the architect was probably not entirely responsible.

It is characteristic of Barry that the finest architectural thought in it should be expressed in the plan, in the idea of the four main corridors, at right angles to one another, and meeting in the central octagon, the position of which is externally expressed by the graceful central lantern. It was another fine architectural thought to place the two towers at the extreme ends of the structure, the extent of which is thus marked out from a distance when the rest of the building cannot be seen; nor was Barry less happy in his characteristic treatment of the two towers—the one purely a State ceremonial tower, marking the royal entrance, and therefore treated as a piece of architectural effect merely; the other a utilitarian tower intended to carry a great clock, and designed so as to express that function. This distinction, which would seem so obvious, and is so truly architectural in spirit, seems, however, to be beyond the comprehension of some people. If Barry had made the two towers similar and balancing each other symmetrically, he would have taken away half the character of the whole group of building.

The removal of Soane's Law Courts from the west side of Westminster Hall a few years ago exposed to view an unsightly and much patched-up wall, and the flying buttresses in a very dilapidated state, together with a certain portion of the original Norman masonry of the Hall, about which a somewhat disproportionate excitement was got up, in accordance with the modern feeling, which is too much disposed to make a fetish of any bit of ancient work, however plain and uninteresting in itself. It was impossible to leave the building in the state in which it was found when uncovered, and the discovery of some traces of the former existence of a double-storeyed cloister between the buttresses furnished an excuse for a so-called "restoration" of this feature; the first motive of which, from Mr. Pearson's report to the First Commissioner of Works, evidently was to find a means of covering in and preserving the fragment of Norman wall. As this was obviously a most abnormal project for such an object, it was claimed in favour of the scheme that rooms could be formed between the buttresses which would be of use as committee-rooms; thus inverting the true order of architectural procedure, which is to provide for ascertained requirements on a definite plan, not to erect an apparently useless structure and then find a use for it afterwards. The subject was discussed at great length by a special commission composed of men who had mostly no knowledge of architecture, the one or two who did know anything of the subject being entirely opposed to the scheme, but hopelessly in the minority. The result has answered only too well the expectations of those who understood best what it was which was proposed. The "restoration" of the cloisters is no restoration at all in the strict sense, as there were really no data for anything beyond a general conclusion that something of the kind was formerly there; and, even if there were, the mere building up again or "restoring" an ancient piece of architecture because it once existed is an absurdity; a modern imitation is not the ancient thing and has not the slightest archæological value. The rooms are found, as might have been expected, to be inconvenient and cramped in themselves and inconvenient of access, and the area of Westminster Hall has been spoiled by the obtrusion of two staircases adorned with gimcrack heraldic animals, the sight of which raised a storm of derision from members of the House of Commons who had sense enough to see the absurdity, when completed, of a scheme which they might have prevented had they troubled themselves to ascertain its merits beforehand, instead of protesting when it was too late. It should be mentioned that Barry's original intention was to have carried out a further extension of the Houses of Parliament in two blocks of building surrounding the space east and north of Westminster Hall, which would have provided committee-rooms and other accommodation for all possible future requirements, and he left plans for this addition which are still in existence, and which it may some day be absolutely necessary to carry out. The side of Westminster Hall would then have been blocked out from exterior view, as in all probability (on the evidence of old plans and drawings) it always was; and Barry would have met the difficulty by refacing it in such a manner as to carry on the design of his courtyard. To many sentimental persons in the present day this would seem absolute desecration, but it is what any Mediæval architect would have done in a similar case without hesitation. The exaggerated reverence for every bit of old building is entirely a growth of the present generation, and merely means that architecture is a dead and not a living art now.

The next important public building after the Houses of Parliament was the Government offices, the great block extending from Parliament Street to St. James's Park. This and the new Admiralty building, at present in progress, have a relation to each other not generally surmised; they are the *disjecta membra* of what was once a great scheme, worthy of the nation, and which has gone through stages of successive decline. Barry drew out, and exhibited in Westminster Hall in 1857, a really grand plan for the concentration of the whole of the Government offices in one vast building or group of buildings, to extend from Great George Street nearly to the Horse Guards, and to have fronts towards Whitehall and St. James's Park. The present block of the Privy Council buildings was to be utilised (architecturally speaking) as the northern wing of the Whitehall façade, and a similar wing to be formed abutting on the east end of Great George Street, the houses east of King Street being abolished, and the wide roadway of Whitehall carried through. Between these two wings the central line of building was to be thrown back somewhat, and through the centre of it was to be a grand gateway or covered way leading into a great colonnaded central hall or court, a parallelogram with its longer axis running east and west, and an opening at the further end into St. James's Park. On the south side of the block would have been a grand façade to Great George Street; on the north side the façade towards the parade-ground was to be laid out so as to be at right angles with the line of the Horse Guards, which was to be architecturally connected with the whole scheme, and on the north side of the parade-ground a façade (for Admiralty extension) was to be formed facing that on the south of the parade-ground, leaving the latter a symmetrical parallelogram with the Horse Guards in the centre of its eastern side and a central gate into St. James's Park facing it on the western side. The vast new building was to be laid out around various interior quadrangles, around each of which would be grouped the offices of a special department. The Board of Trade would have been accommodated in the block balancing the existing Privy Council buildings, with the "Trade Office Court" in its rear; the Home Office and Foreign Office would have formed the two sides of the façade overlooking the park, with the "Home Office Court" and "Foreign Office Court" in their rear; the War Office would have formed the central block of the Park façade, returning along one side of the great central hall; and the same principle was to be carried out through other departments. All the Government offices would thus have been combined into one great architectural whole, in close relation with each other, and in the immediate neighbourhood of the Houses of Parliament. The houses on the southern side of Great George Street were to be pulled down, and the land between that street and the Abbey laid out as an ornamental garden. Thus Great George Street would have formed, along with Birdcage Walk, a kind of state road between the palace of the sovereign and the palace of the Legislature. The scheme included a wide road from the foot of the Haymarket through St. James's Park and past the end of Birdcage Walk to join the east end of Victoria Street—a road which would have been a great public convenience. That, however, was no essential part of the scheme; the main thing was the arrangement of the buildings, and it is rarely that an architectural project at once so practical and so grandiose has been proposed for any official buildings. It would no doubt have cost an immense sum of money, but it might have been carried out gradually and piece by piece, and when complete it would have been a thing for the nation to be proud of. It is melancholy now to look at the plan, and to reflect upon a great opportunity lost.

LOCAL ARCHÆOLOGY.

A MEETING of the Cumberland and Westmoreland Association was held last week at Maryport. The Bishop of Barrow-in-Furness presided, and addressed the members on the importance of local archæology. An educated man could hardly turn in such a country as ours without desiring to know something about the history and character of those who had lived here before him, and whose record he saw in their handiwork on every side. And these local antiquities had been to him a pleasant and wholesome "fad"—an interesting and useful relaxation from the more serious work of life. In the northern part of England there was much work to be done by persons interested in antiquarian subjects, because of the rapid changes which had taken place during the latter part of this century, or which were still in progress. Thus old words and modes of speech were passing rapidly away under the influence of educationists, who considered the language of a Cockney training college to be far superior to the good old tongue of Cumberland and Westmoreland. South countryman as he was himself by birth and education, he had no sympathy with a parent who told him exultingly concerning her children, "They take great pains with 'em; they're getten quite to speak with a south country twang." And if there were any other south countrymen there, let him urge them to make careful notes of phrases or turns of language (as well as words) to which their ears were unaccustomed, for after a time they would not be equally sensitive to them. Old customs, too, were rapidly passing away in consequence of increased intercourse between different parts of England. And in some districts enclosures

and extended cultivation and in others the growth of population had destroyed, and were destroying, the relics of ancient times. And although the larger and more conspicuous remains of antiquity were well-known, almost every district contained some which were hardly known beyond the immediate vicinity, but were not less worthy of study. Coming to the Roman period they found many important remains of that great people. The "Maiden Way" ran up the valley of the Lune, in one place on a high causeway over marshy ground, and it would be very desirable to trace it out in detail throughout its course. A large and important camp was situated about two miles from Kirkby Lonsdale; part of the ramparts might still be seen, and some capitals of pillars and other sculptured stones were preserved. He had in his possession a stone mortar said to have come from the camp, but it was too bulky to bring there that day. The Romans left Britain, but the native tribes retained some of the Roman civilisation, and possibly some submixture of Roman blood. Had they any relics of that period? Yes; two miles from Kirkby Lonsdale there were the remains of a British settlement, traces of huts and cattle-pens, surrounded by an earth bank. And the iron implement (a drawing of which the president exhibited), which he found in excavating the remains of a circular hut, fixed the date. That was one of a very destructive class of implements, called "hipposandals," about the use of which archæologists were not altogether agreed, but it was probably a peculiar kind of horseshoe. Only a few had been discovered in England and on the continent of Europe, but all those known had been found among remains of the late Roman civilisation. Therefore that implement fixed the date of the settlement in which it was found; it was about the time the Romans left Britain. To the Briton, who had received a certain varnish of civilisation from his Roman master, succeeded the stronger and ruder Saxon conqueror. All down the Lune valley the Saxons have left the earthen mounds which were their castle and homesteads; some, as in the vicarage grounds of Kirkby Lonsdale, a simple mound surmounted by a ditch; others on a larger scale, as at Burton-in-Lonsdale, an inner fortress for the lord and his household, an outer enclosure for the serfs and cattle. The Saxon came a heathen; before long the Church sought him out, and in this district, through Celtic missionaries from the North and West, converted him to Christianity. The earliest trace of Christianity in the Lune Valley was the rude stone cross at Barbon, specially interesting because it stands close to the old Roman road, and there was some reason to think that the stone was placed there as a heathen emblem, long before the cross was cut upon it to make it Christian. Once more came heathen invaders. The Danes forced their way up the valley of the Lune from Morecambe Bay, as they did into many other peaceful dales. Here was a trace of them. Some heathen Danish chief wore this silver brooch to fasten his plaid or cloak; and, as he went along the Roman road, the one highway then and for many centuries afterwards, death overtook him. It might have been from some sudden illness; it might, more probably, have been by the sword or arrow of one of the natives of the valley which he was plundering. But at all events, there he died, and was buried hard by the side of the Roman road some time in the tenth century; and 900 years afterwards his brooch was ploughed up, and then put away in a cupboard and forgotten for another 50 years, and then was just going to be sold for a few pence as old metal when happily, by a mere accident, attention was called to it, and its history was routed out. He told them this story now that they might realise the good of local archæological societies, which would keep alive the memory of such finds in their several localities. And then the Danes' children and grandchildren in their turn became Christians, and the name of Kirkby Lonsdale, the church tower of the Lune Valley, commemorates the change, and the foundation of a parish church. And then came the Normans again, and began to rebuild it; and each century from then till now had left its mark still legible upon the fabric. They had a Roman camp within a few hundred yards of that place, and in its immediate neighbourhood had been discovered perhaps the most remarkable collection of Roman altars which had ever been found in England. At Dearham and Crosscanonby churches were hog-backed tombstones and carved crosses of early Saxon times, when the Christianity of the English people was still isolated from that of southern Europe, and retained something both of the thought and of the art of their heathen forefathers. There were examples also of early Mediæval work in gravestones and in the fabrics of the churches themselves of the character of the neighbourhood in later Mediæval times. They had a most interesting illustration in the fortified church at Dearham, which was meant less for a belfry than to be a fortress for the parish. The fact that almost every old manor-house had grown, like Netherall, around an old peel tower was remarkable enough as an evidence of the unsettled state of the district three or four hundred years ago; but these fortress churches told the tale of Border frays in a more striking manner still. Let him, then, urge all members of that Association to interest themselves in observing and recording the antiquities of their own neighbourhood. The study would greatly increase their interest of the reading of history and the widening of their historical knowledge.

CHURCH BUILDING AND RESTORATION.

Ludlow.—Commemoration services have been held in St. Laurence's Church on occasion of the restoration of the tower, which has been carried out under the direction of Sir Arthur Blomfield. The tower walls have been strengthened wherever there were cracks or indications of weakness, and the exterior of the tower refaced. The whole of the decayed stone on the exterior has been cut out and replaced by new stones, but all stones in fairly good condition have been preserved. Eight sculptured figures have been placed on the four faces of the upper stage of the tower representing St. Laurence, St. Peter, St. George, St. Catherine, Edward IV., Edward the Confessor, St. John and St. Leonard. The work has been carried out by Mr. John Thompson, of Peterborough. The cost of the work is about 8,000*l.*

Shadworth.—St. Cuthbert's Church, Shadworth, Durham, has been reopened after restoration. The designs for the work were prepared by Messrs. Hicks and Charlwood, of Newcastle, and the work carried out by Messrs. Carse & Son, of Amble. The chancel of the church has practically been rebuilt, and a new vestry has been added. A lining of bricks has been put in the nave of the church, and new flooring has been put down, with a concrete aisle.

GENERAL.

The Death is announced of Mr. V. W. Voisey, F.R.I.B.A., at Bristol.

"**La Source**," one of the idyllic scenes of M. Puvis de Chavannes, has been sold to a collector in New York.

Mr. Copland, C.E., of Glasgow, has been commissioned to prepare plans for an increased water-supply for Kirkintilloch.

Mr. G. Wormal, architect, has prepared plans for the proposed new buildings and alterations at the Stafford workhouse. The plans provide for a new infirmary, separate fever wards, a new chapel, porter's lodge, &c., with various structural alterations in the present building.

Mr. Herbert Kirk, of Sleaford, was elected county surveyor at the meeting of the Kesteven County Council held at Grantham.

A Petition was presented at the meeting of the Court of Common Council, by Mr. Alderman Tyler, from Mrs. Peebles, widow of the late Mr. A. M. Peebles, the City Architect, for assistance; but a motion to dispense with the petitioner's personal attendance having been negatived, the consideration was postponed.

Mr. W. Oxtoby, of Hull, has been appointed borough surveyor of Beverley.

The Bath Town Council have decided to have an open competition for the proposed municipal buildings.

A New Lecture-hall and Offices for the principal are to be opened next month in connection with the Crystal Palace School of Practical Engineering.

The Paisley Authorities have approved of plans for the erection of a reception-house in New Sneddon Street, and for the carrying out of alterations in the Bladda Hospital, the cost of which will be about 2,000*l.*

Dunville Park, Belfast, an estate which Mr. R. G. Dunville has presented to the city, has just been opened by the Marquis of Dufferin and Ava. The park cost 13,500*l.*, and Lady W. Dunville has given 5,000*l.* to provide park-keeper's house, fountains, &c.

At the Meeting of the Carlisle County Council, a resolution to make safe a dangerous bridge—the Petteril Bridge—by erecting a lamp at each end was defeated in favour of an amendment to reconstruct the bridge. The cost of reconstructing and widening the bridge, it was stated, would cost at least 1,300*l.*

The Chairman of the Midland Railway Company, at the meeting just held, stated that since the accident on the Brighton line the engineer had made a further report on the condition of their bridges, and he had reported that there was everywhere a large margin for safety. It was, however, intended to proceed with the reconstruction of the 181 cast-iron bridges, upon which they proposed to expend 85,000*l.* in the present year.

At the last Meeting of the Lincoln Town Council a site was fixed on for the erection of municipal buildings. The Estates Committee was instructed to submit proposals with regard to the proposed new building to a future meeting of the Council, in order that instructions might be given for the preparation of plans.

The Architect.

THE WEEK.

On Saturday last the members of the Archæological Institute visited Glasgow Cathedral, which was described by Mr. John Honeyman, who has devoted much time to a study of the building. The peculiarity of the site on which the cathedral stands was said to have been probably determined by the fact that it was the traditional burial-place of St. Mungo, otherwise St. Kentigern, to whom the cathedral was dedicated. When in the lower church Mr. Honeyman remarked that it was a most terrible pity that that part of the edifice should have been ruined to such an extent by the recent introduction of stained glass into the windows. He did not believe they were ever intended for anything of the kind; and in this opinion Mr. Honeyman seemed to have the hearty sympathy of a large proportion of the visitors. The nave also contains many windows which are out of place in such a building. In the choir, Mr. Honeyman said the most striking architectural feature was undoubtedly the peculiar arrangement of the east end. It was at once noticeable from the fact that it necessitated the placing of a pier in the centre of the gable, so carrying round the main arcading of the choir as well as the aisles, while above there was the other peculiarity of a group of four lancets, instead of the more common grouping of three or five.

Although drains may not be the cause of diphtheria, still in all cases an outbreak should be made the occasion of a thorough investigation of the drainage system of the building in which the patient resides. The Corporation of London have set an example of the kind which is worthy of imitation. Shortly before Christmas a death occurred in the family of the head master of the Freemasons' Orphan School at Brixton. The sanitary authorities of Lambeth visited the building, which contains about two hundred children, and expressed their opinion that the system of drainage was seriously defective. An examination by these officials and the City surveyor (Mr. A. Murray) was made, the result being the decision that the system, which had existed for forty years, was not only entirely out of date, but so incomplete and inefficient as to constitute a serious source of danger to those living in the school. In these circumstances the Lambeth officials insisted on the whole of the drains being removed and new drains carried outside the building. The Corporation lost no time in taking action, and all the drains are now of an improved form and are adequate to the requirements of so large a building.

Among the subjects treated by Dr. W. Huggins, F.R.S., in his address as President of the meeting of the British Association at Cardiff on Wednesday, was the photographic chart of the heavens which this year was commenced. This great undertaking originated in an international conference which met in Paris in 1887, by the invitation of M. l'Amiral Mouchez, director of the Paris Observatory. The richness in stars down to the ninth magnitude of the photographs of the comet of 1882 taken at the Cape Observatory under the superintendence of Dr. Gill, and the remarkable star-charts of the Brothers Henry which followed two years later, astonished the astronomical world. The great excellence of these photographs, which was due mainly to the superiority of the gelatine plate, suggested to these astronomers a complete map of the sky, and a little later gave birth in the minds of the Paris astronomers to the grand enterprise of an international chart of the heavens. The actual beginning of the work this year is in no small degree due to the great energy and tact with which the director of the Paris Observatory has conducted the initial steps, through the many delicate and difficult questions which have unavoidably presented themselves in an undertaking which depends upon the harmonious working in common of many nationalities, and of no fewer than eighteen observatories in all parts of the world. The three years since 1887 have not been too long for the detailed organisation of this work, which has called for several elaborate preliminary investigations on special points in which our knowledge was insufficient, and which have been ably carried out by Professors Vogel and Bakhuyzen, Dr. Trépied, Dr. Scheiner, Dr. Gill, the Astronomer Royal and others. Time also was required for the construction of the new and special instruments. The decisions of the Conference in their final form provide for the construction of a great photographic chart of the heavens with exposures corresponding to forty minutes' exposure at Paris, which it is expected will reach down to stars of about the 14th magnitude. As each plate is to be limited to four square degrees, and as each star, to avoid possible errors, is to appear on two plates, over 22,000 photographs will be required. For the more accurate determination of the positions of the stars, a *réseau* with lines at distances of 5mm. apart is to be previously impressed by a faint light upon the plate, so that the image of the *réseau* will appear together with the images of the stars when the plate is developed. This great work will be divided, according to their latitudes, among eighteen observatories provided with similar instruments, though not necessarily constructed by the same maker. Those in the British dominions and at Tacubaya have been constructed by Sir Howard Grubb. Besides the plates to form the great chart, a second set of plates for a catalogue is to be taken, with a shorter exposure, which will give stars to the 11th magnitude only. These plates, by a recent decision of the Permanent Committee, are to be pushed on as actively as possible, though as far as may be practicable plates for the chart are to be taken concurrently. Photographing the plates for the catalogue is but the first step in this work, and only supplies the data for the elaborate measurements which have to be made, which are, however, less laborious than would be required for a similar catalogue without the aid of photography.

To the Americans English-speaking people are indebted for the dictionaries of Webster and Worcester, which have superseded Johnson's, and are made the basis of many of the later works published in this country. A new dictionary, of which Dr. Funk and Dr. Graham are editors, and Dr. March the consulting editor, is about to be issued by Messrs. Funk & Wagnalls, of New York. If we may estimate the whole work from an instalment, the "Standard Dictionary" will be considered to deserve its title. The different divisions of knowledge have been assigned to special editors, and never before have so many brains co-operated in the production of a single-volume dictionary. There are several peculiarities in the pages which facilitate reference and suggest the various relations of a subject. There is an abundance of illustrations, and a more useful book of reference for students of English, past and present, can hardly be found.

The French are liberal in providing bursaries for students of art, and it was always understood that the recipients would be careful to comply with the conditions, and especially with the principal one which prescribed residence abroad. It is not creditable to find students evading the rules by remaining all the time in France, and accordingly steps have been taken to prevent irregularities of the kind. Henceforth every winner of a bourse-de-voyage will only receive the instalments in a foreign town. If, for example, the prize is worth 4,000 frs., on departure from Paris 500 frs. will be paid to the student, and while he is abroad he will be remitted 300 frs. per month for ten months, the balance of 500 frs. being obtainable on his return to Paris. Should the student grow tired of exile and return to France before the time prescribed by the authorities, he will forfeit the sum remaining unpaid. It will be necessary for each student to inform the Department of the town in which he proposes to reside, and every month he will have to send a report to Paris describing the progress of his studies.

The *Victory*, which lies in Portsmouth Harbour, forms the subject of an interesting history and analysis by Captain Orde Browne and Mr. H. J. Webb, which is published at the office of the *Engineer*. The description of the timber-work reveals that scientific principles were followed in building up the framing, which resisted so well the impact of the French shot. Much of the timber is modern, but we suppose the new pieces were copies of those superseded.

THE SOUTH KENSINGTON COMPETITION.

LIMITED competitions have advantages, but they always excite less interest than those which are general. In the latter there is a chance for men who are unknown, and whenever they win, a sense of satisfaction prevails among good-natured people which it is a pleasure to experience. When the contest is between a few men, it is only partisans who can feel much excitement about the result. That is one reason why architects and the public have been indifferent about the result of the competition for the completion of the South Kensington Museum. Now that it has ended, people are likely to look upon the competition more seriously, for it seems to be inevitable that the new works will lead to the demolition and reconstruction of the greater part of the existing Museum. This conclusion will be more evident from a consideration of the character of the work which Sir Henry Cole inspired.

It is well to remember that in the days when he set about a reform as "Felix Summerley" he put more value on decoration than on form. His "art manufactures" were more striking from the ornament than from the contours. When he became supreme at South Kensington he acted on the same principle, and in the buildings construction became subservient to decoration. The upper part of the walls of one court he had filled in with figures in mosaic of artists, the architects being in the minority. The girders and ironwork were treated as if they were intended to be fields for most elaborate stencilling. Henry Cole knew that the British Museum, from the monumental character of its architecture, repelled visitors. Accordingly he took care to mask his building as much as was possible without the aid of tapestry hangings, and where a part could not be concealed he gave it a sort of festive character. He did not believe in severity of style or in ponderosity. Among the humbler classes he was eager to attract to his collections he knew there were many who resembled the father of Mrs. Plornish in "Little Dorrit," good folks who believed there was nothing in or out of the world to surpass a tea-garden. Henry Cole therefore preserved as much greenery as possible about his Museum, and used collections of ferns to give repose to eyes that at first were likely to be bored by Italian sculpture. His own portrait was rightly placed in a faïence frame in front of that ceramic gallery which he considered to be one of his triumphs. To create a gallery which East-End visitors would believe was all made of the same delph as the plates they employed was undoubtedly a triumph of showmanship. The material had also the advantage that it allowed chubby figures to appear without any stint on the columns or wherever they were likely to be most effective. Cole was well served. Fowke and Scott, as became disciplined officers, laboured with loyalty under his direction to provide opportunities for displaying the work of Godfrey Sykes and the staff of decorators, as well as the work of such painters as could be persuaded to contribute. Considered from the director's point of view the experiment was most successful. Crowds that avoided the British Museum as if it were a house of bondage found pleasure in journeying to South Kensington, where every object seemed to be set out for their gratification, and there can be no doubt that many were instructed by what they saw.

The contents of the Museum are as delightful as ever, but what about the casket that contains them? One test of all good work is that it becomes more admired as the mind grows in power, and that test the Museum cannot sustain. Those who could at one time appreciate the motives through which precedents were set aside in the erection of the building must feel that the lightness which is supposed to characterise the courts is only another term for meanness. As long as there is no standard with which the existing interior can be tested the defects may be passed over; but with an exterior and new courts having architectural style, the shortcomings of the Royal Engineers' work will become more manifest, and will plead for removal.

The architects who took part in the competition for the completion of the Museum buildings could hardly avoid the consideration of the fate of the parts which Henry Cole created. If the existing buildings are to be preserved, the additions ought to correspond with them. If, sooner or later, Cole's work is doomed to be swept away, there was no restriction as regards the style, and present-day ideas about suitability could be followed. The majority of the competitors have taken the latter view, but the carrying out of any of the designs would involve the transformation of the present courts. In a building of the kind it is necessary to exemplify unity and consistency if the system of art teaching is to be respected. Elsewhere there might be excuses accepted for vamping, but at South Kensington the Museum ought to be entire and perfect as any of the works which it holds. If Henry Cole were alive, he would tolerate no departure from the principle he adopted. The decorator would continue to be predominant in any additions that were made, and the purpose of the Museum would probably be suggested on the exterior by a colossal picture in mosaic and as many works in sculpture as could be obtained by a modest expenditure of money. But a more rational system having been adopted, which allows architecture to assert itself, the consequences will have to be accepted, regardless of the expense. The mere fact that a competition was arranged by the Government is evidence that a demolition of parts at least of the Museum is contemplated, for it was quite possible to complete the building in the style of the executed work from plans which were formerly prepared.

The design bearing a Greek motto would merit the prize if the new works were to be confined to the additions prescribed to the competitors. It is well adapted for terra-cotta. The figures that surmount the central part are not in keeping with the style adopted, and would appear out of place at South Kensington, but the delicate relief which covers so large a part might be considered as inspired by the *genius loci*. Sir Henry Cole could hardly fail to admire the design, but he would be likely to object to so much relief, as the district now sends out enough dust and soot to fill up all hollows without respect for art. The introduction of a fountain near the Exhibition Road (to accommodate which the building front is made concave at the corner) would also please him. The building is shown as of two storeys, with a mezzanine, and there is no tower, a feature that was not considered necessary when the Museum was started. The entrance-hall is a rectangle, with the longer sides parallel to the front, surrounded by a corridor, and flanked by the eastern and western courts. There is a drive in front. The ironwork in the spandrels of the roof principals could be easily arranged in a more pleasing way. Altogether the design may be taken as a compliment to the Museum, for it shows that the style adopted there is capable of some development.

"English Tradition" is essentially a design for masonry. It is Classic, and the general horizontality is emphasised by the treatment of the ashlar. There is little arching, and where it is used the depth of the voussoirs forms a contrast with the parallelism of the courses. The author is sparing in fenestration, and, apart from the gain in architectural effect which the absence of openings secures, there is more truth, for what is the use of windows in the sides of a building when it is notorious the principal light must be obtained from above? At a time when so much license is taken in the treatment of Classic, a wholesome effect would be produced by the appearance of a building like that shown in the design. But such an exterior would make the courts at South Kensington more insignificant than they are. There is no concession to the pretty things devised by the decorators, and, in fact, inside and outside would be in opposition if the design were realised. The building is kept low throughout; the south-west angle is treated so as to increase the general appearance of strength, and the columns employed are Ionic. There is a squat tower, which is not improved by the double set of pediments. The entrance-hall leads into a circular court which has four semicircular recesses, one of which would be used for the sale of catalogues. From the central court are corridors leading to the other courts. The building proposed is too severe to meet approval in our time; but the author deserves credit for adherence to a style that he believed was the most fitting, although by doing so he courted rejection.

The design marked by a shield with an arrow in the field appears in the perspective as very complex, and its character should be judged from the details. The exterior

would be of red brick and stone. Importance is attached to the central hall, of which the dome is rightly made to appear in the centre of the exterior view, and it is connected with the front by flying buttresses. The entrance is also made an important feature, being flanked by two towers, and evidently much thought has been bestowed on the central part of the south face. The central hall is lighted by windows below the springing of the dome and a glazed opening at the crown. The soffite is coffered, but in such a building it would have been better to employ painted or sculptured decoration. Around the hall are galleries ; the dome is carried by coupled columns and arches with figures in the spandrels. A sign of the care taken in the detail is shown in the truncation of the triangular space in order to avoid too long a line of drapery, but the change is not to be recommended. The windows are well arranged, each storey being different, those in the third being triple and having almost the effect of an arcade, and the front is divided into bays by piers and columns. At the north-west angle is a tower with a gallery on top surmounted by one of those octagonal tiled roofs sometimes seen in Italy. This design becomes more interesting as it is studied.

The design inscribed "Prince Albert" is shown on a perspective that might be the work of one of M. Lessore's pupils. It suggests that South Kensington is a place of floods and darkness. Any building with such an environment can hardly be taken as captivating. The entrance-hall is rather small, but in this design more importance is given to a staircase than in the others. The central part of the exterior is made concave on plan, and is enriched by a line of Corinthian columns. That the important part of the building is not in front is made visible from the outside, the part nearer the road being lower in height. There are two octagonal courts which are covered with flat domes, and they afford contrast to the horizontal lines. At one end is a high tower. There is much novelty in the treatment, and from the number of finely curved lines, it is a pity the design cannot be shown by a model.

"Verona" is the motto on a design which a builder would appreciate for its definiteness. There is no striving after originality. The centre is recessed in this case also, the junction of the connecting curves being marked by pavilions. There are two storeys, the upper one having an arcade with coupled columns, the lower part of the shafts having sculpture. The central court has a coved glass roof, which is visible from without. There is an effective tower on the west side.

The successful design no doubt gained approval partly by the respect for economy which it exhibits. Mr. Webb is not afraid of repetition. By placing the tower in the centre he not only makes it useful by giving dignity to an entrance which is through it ; but in consequence of its position symmetry, and therefore economy, appear to be essential. The windows are large ; square-headed in the basement, and with round heads on upper storey. Whether they were so arranged out of respect for the Natural History Museum need not be discussed ; in any case they are of forms that are well adapted for terra-cotta. The central part of the principal front is recessed ; in this case curves are avoided, and the angles are marked by pavilions. The south front, taken as a whole, is distinguished by an appearance of simplicity, which deserves commendation. The court that will be first entered from the hall measures 170 feet by 83 feet. The Oriental court is 144 feet by 98 feet. The principal court will have a more architectural character than any found in the Museum, and from its solidity it will not be suggestive of a transformed conservatory.

"Ars longa, tempus breve," might be supposed to have been a close competitor with the successful design, if it were not for the sort of Temple Bar that is introduced above the principal entrance. There are some good features. The raking lines in the staircase tower at the corner, which most of the competitors have emphasised in some way, are a welcome contrast to so many vertical and horizontal lines. The small stairs to the skylights do duty as piers. The principal approach is also managed admirably. Some of the columns have reliefs on the shafts, and sculpture in relief is introduced near the columns. The principal court is square on plan, with a circular dome that springs from girders which cut off the angles, the outer spaces being covered with semi-domes. In this design, as in Mr. Webb's, there is much to suggest light and ample space.

In "Chi se contenta gode" the ground is fully utilised. The front is brought near the roads, and as the acute angle formed by the Exhibition Road is accepted as indispensable, the western courts are not rectangular, a defect that is already visible in the Museum. One of the gains by the arrangement is a very large central court, which, however, is not as successfully treated as is desirable. The central part in this case also is set back, with a tower in the middle and pavilions at the angles. The windows are generally square, with arched heads for sculpture. A large frieze is introduced on the central part, and it is one of the features which can be praised without reservation. It is evident that the author spent much time in quest of surprises, but the results are not always satisfactory.

Taken as a whole the designs do not afford evidence in favour of limited competitions, unless on the ground that trouble was spared in the examination. There are many architects who have been constant frequenters of the Museum, and who have often speculated about the completion of the building. We may go so far as to say that few cases could be found in which so many were prepared for the contest. They deserved to have a chance. When it was decided to ignore the official plans, the Government would have acted more wisely to have arranged for a general competition. It is true the result in the War Office and Admiralty competition was not encouraging, but the circumstances are different with a scheme like the South Kensington one, which has already given rise to much experimental designing.

THE SOCIETY OF ARCHITECTS' EXCURSION TO BELGIUM.

IT was a signal honour which was conferred upon the Society of Architects, and, through that Society, upon the whole body of English architects, when, on Saturday last, a party of forty-one of its members and their friends were granted an audience by His Majesty the King of the Belgians, on their landing at Ostend for an excursion of a fortnight's duration in his country. When ushered into the presence-chamber, the president (Mr. W. H. Seth-Smith, F.S.I.) advanced and delivered the following address, which he informed His Majesty had been illuminated by one of the members :—

To His Most Gracious Majesty, Leopold II., King of the Belgians.

May it please your Majesty,—Upon this, the occasion of the first visit of the Society of Architects of Great Britain to Belgium, they desire to express to your Majesty their sense of the great honour which you have conferred upon them by granting them an audience, recognising in that favour the fact that your Majesty welcomes them as being professionally interested in the ancient buildings of your country, buildings whose reputation for beauty is world-wide, and whose origin lies in the civic liberties and enterprise and in the religious devotion of your subjects. These monuments of taste and skill are particularly attractive to the modern English architect, who gladly acknowledges his indebtedness to them for many an inspiration. The Society also recognises in your Majesty's gracious reception, and that of your people, a desire that the architects of Belgium and of England should be brought into closer and more friendly relations with each other for their mutual benefit, and that the buildings of each country should become better known to the architects of the other, with a view to the erection in both countries of works of greater dignity and beauty. This, and other objects bearing upon the development of architecture, the Society of Architects was formed to promote, and its members will continue to support and forward them at all times to the best of their ability.

Signed on behalf of the Society,
W. H. Seth-Smith, *President.*
Edgar Forman, *Honorary Secretary.*
G. A. T. Middleton, *Secretary.*

To this the King replied at considerable length, pointing out where, and in what way, ancient Belgian differed from ancient English work, and particularly drawing attention to some modern buildings in the towns to be visited during the excursion, giving a very pressing invitation to the members to visit his new palace at Laeken, near Brussels, now in course of erection, next Saturday afternoon being fixed for the visit. Each member of the party was then introduced to him in turn, and from each he asked for information, being evidently impressed by the great number of localities which were represented.

The audience over, the members dined and toasted His Majesty, proceeding afterwards to Bruges, where Sunday was spent in quietude.

Monday was a busy day, for Bruges is full of interesting work, and everybody wished to see it all. The first visit on the programme was to the Hôtel de Ville at 10.30, and the members were to time; yet before that they had visited the Carmelite Church, with its Renaissance work, and had had a passing glimpse of the new Normal School for girls. It was the city architect, M. Saucerie, who met them at the Hôtel de Ville, and took them over it and the adjoining buildings, showing them the old Council Chamber, now under restoration by himself, and in such a condition as rendered careful inspection of the ancient construction of both brick and timber vaulting and of the heavy timber roof an easy matter. He then escorted them to the adjoining house, the ancient "Greiffe," for an inspection of the fine Renaissance doors now preserved there, and to the Palais de Justice, to see the chimneypiece which everybody knows. It may be prejudice against that which everybody sees, but it did not seem so tasteful as the less assuming work in the doors just mentioned, or that in an old bookcase in the jury-room adjoining. It is bold and well conceived, most certainly, but leaves a confused impression, which the best work should scarcely do. The "Tour des Halles," or belfry, which boldly fronts the Place, of course was well worth visiting, to see the mechanism of the bells, worked by a great studded drum, like that of a huge musical-box, automatically by the clock, every quarter of an hour. Some hammered ironwork, too, was deserving of study in the muniment-room there, as much from the manner in which the coils had been formed from slices of iron cut down off the main stem as from the actual design.

About the Chapelle de Sainte Sang it was a general grief that little time could be devoted to study of the exquisite Flamboyant foliage on the exterior, while the interior, save for a fine picture and a little good hammered brass, was scarcely worthy of the time devoted to it. Then came a hurried visit to the old houses in the Place Van Eyck, and then the principal feature of the day, a careful inspection of the Normal School, glanced at in the morning, under the conductorship of its architect, M. Saucerie, who has, from long study of his native work, become thoroughly imbued with its spirit, and is producing, not only in this building, but in the new post office in the Place and many other edifices in the city much to show that he works as our forefathers worked, simply using the knowledge of his predecessors and unconsciously developing it to meet his modern needs. These examples are not mentioned in the guide-books, but all architects visiting Bruges should make it a point to see his buildings. Still there was the Cathedral to be seen, with the delicate Gothic tracery to the choir-stalls and the carved misereres, curious, as is usual; and here another excellent conductor was met with in the resident canon. The church of Notre Dame was also visited, the exterior of the small baptistery, a beautiful specimen of fourteenth-century work, being much admired. After that several of the members inspected Memling's pictures in the hospital of S. Jean; but there was little time to spare, and the train was entered in order to proceed to Ghent shortly after six o'clock.

Tuesday opened warm and cloudy, so that the light was indifferent as compared with that of the previous day, and the buildings of Ghent suffered in consequence, though no considerations of mere light, so long as there was enough to see by, could much affect the delight which architects must of necessity experience when seeing the Hôtel de Ville, and especially the skipper's house, for the first time. Unfortunately, however, but little time was given to these buildings save by the non-political Separatists, who prefer to sketch in solitude to scurrying about in charge of even such conductors as have placed themselves at the disposal of the Society during this excursion. M. Van Assche, the architect for the restoration of the Cathedral, still proceeding, acted in that capacity on Tuesday, leading the members first over the edifice with which he is most intimately concerned, a building which, having been destroyed, except the mere shell, by a fire in the sixteenth century, he has almost had to reconstruct, and though his work may not be that of an original artistic genius, it at least shows careful study of what has gone before, while the triforium and clerestory are really very fine. The palace of Gerard le Diable had a fine hall to show, dating from the thirteenth century, though seemingly much older, with stone vaulting carried by two rows of columns, having the simple foliage of the caps springing directly from the piers without the intervention of a necking; but the ruins of the Abbey of St. Bavon were of much greater interest, containing fragments of primitive Roman walling, and much good Romanesque and slightly later work, all now in picturesque confusion, and not much the worse for exposure to the atmosphere. Much time was given to it—more than could well be spared, for even yet, well on in the afternoon, the Hôtel de Ville had not been seen. It was passed by with a hurried glance in spite of its great beauty, the full meaning neither of the elaborate Gothic carving nor of the two flanking simple bits of Renaissance with superimposed orders, each setting off the other, being fully grasped, nor even points of detail mastered. The château of the Counts of Flanders was little worth a visit, but this was well made up for by the inspection of an unique twelfth-century oak open roof—that to the Boucherie, gloriously bold and perfect still, which but for M. Van Assche would have been passed over, as it is by nearly every visitor to Ghent; nor would it, in its great simplicity, appeal to any save the architect and archæologist. It is different with the rich skipper's house, seen last, with its wonderful richness of design and play of colour in the mouldering stone, set off so grandly by the plain neighbouring building, Romanesque and Renaissance, upon the Quai aux Herbes. It was most regretfully that Ghent was left for Antwerp early in the evening, but the journey is a somewhat long one, and a later train would have upset all arrangements for a comfortable dinner there—and even touring architects are human, and regard the inner man.

THE VICTORIAN INSTITUTE OF ARCHITECTS.

THE annual meeting of the Victorian Institute of Architects was held on July 6, Mr. George C. Inskip, president of the Institute, occupying the chair. There was a large attendance of members.

The President delivered his annual address, in which he stated that the first examination in architecture to qualify for admission as associate was held during the first week in May last, when four candidates presented themselves. Of these two passed, but the gold medal was not awarded by the examiners, as the work done did not in the opinion of the examiners reach the required standard. The most important matter which had occupied the attention of the council during the year was the Registration of Architects Bill, which had been framed with a view to preventing others than skilled persons from practising as architects. Mr. R. W. Best, M.L.A., had taken charge of the measure. The council had also had under consideration the advisability of endeavouring to induce the Government to call for competitive designs for all buildings likely to cost 5,000*l.* and upwards; but in view of the constant complaints made by members of the Institute as to the mode in which architectural competitions were generally decided, the council thought it inadvisable to approach the Government until satisfactory rules regulating competitions were drawn up and adopted. The council had also been in conference with the Builders and Contractors' Association on the question of the conditions inserted in contracts, and a hope was expressed that before long amended conditions, satisfactory alike to builders and architects, would be laid before the members. As soon as the drainage of Melbourne was taken in hand by the Metropolitan Board of Works an immense amount of work would have to be done in connecting dwellings with the sewers, and this work would require the most careful attention of architects. If this part of the sewerage system was not properly carried out, the danger to health would be much greater than under the present system. In his opinion a consulting architect should be appointed to advise the board in all matters relating to buildings. A new Building Act was also required. It appeared from the census returns that the population of Melbourne had now reached nearly 500,000, and though over legislation was to be deprecated, there was great need for stringent regulations regarding the erection of new dwelling-houses and the laying out of new streets. The Act should be framed so as not to unduly interfere with building operations, but it should insure the erection of none but healthy dwellings and well laid-out and properly-drained streets. It was also absolutely necessary that some regulation should be in force to put a stop to the erection of such death-traps as might be found by the hundred

in the various suburbs of the city. There should also be some limit put upon the height to which buildings should be erected. The width of the street should to a great extent govern the height of buildings, as was the rule in Germany, France and Sweden. The erection of ten and twelve storeyed edifices greatly increased the risk by fire, and also dwarfed the many well-proportioned buildings in the immediate neighbourhood of these buildings, and made both appear ridiculous. No matter how skilfully these buildings were designed, they were certainly a disfigurement to the streets. It should also be made compulsory, where land was being cut up for building purposes, that the roads should be formed and the drains laid down before it was allowable to erect any buildings. In many cases this plan had not been adopted in the past, and after the roads were made it was found that the floors of the dwellings were below the street level. In the matter of artisans' dwellings they had seen by the failure of one of the largest building societies instances where streets of shoddy houses were allowed to be erected. The Building Act should be framed to put a stop to the erection of such places. The housing of the working classes was a matter of vast importance. At present they were compelled in many instances to live in shoddy houses, put up by greedy speculators, without proper drainage or ventilation, and the rent of these death-traps was excessive. On the question of architectural education, there were many highly-trained and educated architects, but they did not receive from the public the encouragement to which they were entitled. He trusted, however, that the endeavours to raise the standard of architectural education would do much to point out to the public the important position which the architect held. No doubt a good deal of sickness had been caused by the badly built, badly drained and badly ventilated houses in which so many people were contented to live. The scheme of examination lately adopted by the Institute would do much to raise the status of the profession, and to gain for the members the confidence and respect of the public, and would show that they were worthy to occupy a leading position among the other learned professions. The Melbourne University possessed a well-equipped civil engineering school, to which should certainly be added a school of architecture, so that young men could obtain a thoroughly scientific training.

The election of office bearers was proceeded with. It resulted as follows:—President, Mr. G. C. Inskip; vice-presidents, Messrs. P. Oakden and P. Matthews; hon. treasurer, Mr. D. R. Stewart; members of council, Messrs. F. Purbrick, Lloyd Tayler, A. M. Henderson, J. Talbot and T. S. Watts; associate member of council, Mr. R. C. Hyndman.

HOLBEIN'S "AMBASSADORS."

THE painting by Holbein, commonly known as *The Ambassadors*, is now visible in the National Gallery, and every one who sees it must approve of the wisdom which decided the purchase of the work from the Longford collection. But there are many of the details which are not easily understood. Sir F. W. Burton hints that he will be able to elucidate the mystery. Meanwhile Mr. C. L. Eastlake offers the following explanation of some of the accessories:—

The words inscribed on the open choir-book which lies on the open shelf of the what-not were, until the picture had been cleaned, somewhat obscure, and even now, what with the old form of spelling, the abbreviations, and the obliterations of age, are not easily decipherable, but as I read them they appear to be these. On the left-hand page:—

> Kom Heiliger Geyst herzegott erfüll mit deiner gnaden und (?) deiner gleubge hertz mut un sin dein brustig lib entzüd in ihn.
>
> O herz durch deines lichtes glast (?) züdem glaube versamlet hast das volck aller welt zunge . . . (?) dir herzu lob gesungen . . . gesungen . . .

On the right-hand page:—

> Mensch wiltu (?) leben seliguch und bei Gott blibene Solch (?) halten die zehen gebot die uns gebeut unser Gott . . . unser . . . D . . .

It seems to have been assumed that the choir-book is a Protestant one, and therefore inconsistent with the presence of the silver crucifix recently revealed in the left-hand upper corner of the picture. But it is evident that the hymn or anthem above-mentioned is merely a paraphrase of the well-known "Veni Sancte Spiritus," which for ages past has appeared in the Roman Catholic breviary for use on Whit Sunday or the Feast of Pentecost, and still survives in the Anglican Ordination Service. On the other hand, it must be remembered that the crucifix is retained to this day in Lutheran churches, and cannot therefore be regarded as any evidence that the persons represented adhered to the more ancient form of faith. In view of these facts, all supposed inconsistency involved by the introduction of the two objects in question at once disappears. The terrestrial globe which lies on the same shelf as the choir-book presents a point of historical interest. Somewhere between 40 deg. and 45 deg. W. longitude a red line has been traced, stretching from the North Pole towards the South, passing west of the Azores (named Accores on the globe) and west of Cape Verd Islands—St. Antonio is indicated—but considerably east of the Antilles, among which Antigua is marked, and continuing southward into Brazil, where it is lost in the perspective of the sphere. Near this red line will be observed the words:—

> LINEA DIVISONIS CASTELLANORV ET PORTVGALLEN.

The significance of this inscription is explained by events which had occurred towards the close of the fifteenth century. They are thus concisely recounted in the article on "Spain" in the "Encyclopædia Britannica":—"The Spaniards now turned further westwards, and a wholly new problem was created by Columbus's discovery of the West Indies in 1492. His voyage had been undertaken under the patronage of Isabella, and the new territories were regarded as pertaining to Castile. To solve any difficulties that might arise, a Bull was obtained from Alexander VI. in 1493, which granted to Spain all discoveries west of an imaginary line drawn 100 leagues to the west of the Azores and the Cape Verd Islands. As this arrangement excited Portuguese discontent, it was modified by a treaty at Tordesillas in 1494, which removed the boundary line to 370 leagues west of the Cape Verd Islands. This modification had important results for the Portuguese in giving them their subsequent claim to Brazil."

The "imaginary line" referred to is no doubt the one marked on the globe. With regard to the distorted skull in the foreground, I think it probable that Holbein painted it in a convex mirror, the radius of whose curve was parallel to the plane of the picture, and the best confirmation of this hypothesis is that a convex mirror, placed transversely towards the same plane, reflects the skull in its normal proportions, if such a term may be applied to this dilapidated relic of humanity.

In reference to the theory that this object may indicate the decease of one of the so-called "Ambassadors"—viz. the pale personage depicted on the right of the spectator—I may add that, unless my eyes deceive me, the emblem of a skull is repeated on a small scale, as an ornament, in the cap worn by the more important looking figure on the left. Whether these several facts, directly or indirectly, may tend to throw any light on the identity of the persons represented by Holbein is a question, but it seems desirable that all details connected with this truly remarkable work should be recorded.

THE EDINBURGH HERALDIC EXHIBITION.

A PAPER was read by Mr. J. Balfour Paul, Lyon King of Arms, on "The Edinburgh Heraldic Exhibition" at the Congress of the Archæological Institute. It was his desire, he said, to describe some of the most interesting articles in the exhibition which had been got together in view of the visit of the Archæological Institute. Archæologists were divided into many classes, but few could afford to dispense with some knowledge of heraldry. It was, however, through the art of the illuminator that heraldry appealed most strongly to the popular taste. People who knew nothing of heraldry as a science, and who were not interested in tracing the descent of a family and exploring its various alliances, could still admire a finely-executed blazon as it appealed to their artistic sense. Look, for instance, he said, at the grant of arms to the Tallow Chandlers' Company of the City of London. It was one of the oldest, if not the oldest, grant in existence. It was given by Joshua Smart, Garter King of Arms, on September 24, 1454, thirty years before the present College of Arms was incorporated. However useful the art of printing might have proved, there was no doubt that from its introduction the decadence of the art of illuminating and writing manuscripts might be dated. The grants or arms of the next century were tawdry and stiff in comparison with their predecessors, and indeed it might be said that the art of blazoning had never again reached such high excellence as it did in its early days. As regarded grants of arms, England easily bore off the palm both in respect of beauty of design and artistic treatment. What were probably the two earliest Scottish grants in existence were both exhibited, one to Sir James Balfour, of Pittendreich, and the other to Lord Maxwell of Herries. The most interesting, as well as the most artistic memorial connected with Scotland was that from the Archerfield library (671), which, he believed, for the first time was brought into public notice. Its history deserved a word of mention. The first owner of the book of whom they had taken any record was Lord George Seton, the devoted adherent of Queen Mary, who met her on the shores of Lochleven, and who was afterwards exiled for adherence to her cause. On his death in 1585 it became the property of his son, Robert, afterwards Earl of Winton, and about 1630 it was acquired by the Marchmont Herald, subsequently passing into the possession of Wm.

Nisbet, of Dirleton, to whose representatives it still belonged. This armorial marked a distinctive advance in respect of artistic treatment on anything which had been previously seen. The figures of the Scotch monarchs were full of vigour and individuality, and with all of them there was a manifest aim to adhere with antiquarian accuracy to the costume of the various periods. The faces were evidently intended to be portraits, and agreed with the traditional representations of the monarchs. James IV. was depicted with an iron chain round his waist, which, according to tradition, he wore constantly next his skin in expiation of his rebellion against his father, and by means of which his body was said to have been identified after the Battle of Flodden. The effigies of James VI. and his Queen were particularly rich and elaborate, a purple canopy being introduced, blazoned with the arms of Scotland impaling Denmark. Mr. Paul then glanced at the foreign exhibits, remarking that in the case of the armorials they were represented by facsimile reproductions, though he had not seen any of the original MS. Not the least interesting part of the collection consisted of those articles of very diverse kinds which had some definite historical association. Among these was mentioned the great Cavers banner, which was said to have been the banner of James, second Earl of Douglas and Mar, and to have been carried by his son, Archibald Douglas of Cavers, at the battle of Otterburn, 1368. If this were so, and he saw no reason to doubt the tradition, it was one of the oldest flags in existence. Other interesting exhibits to which he directed attention were the "Percy Gauntlets," said to have been attached to Hotspur's lance as a *gage d'amour*; the Ballender banner, anciently carried by the Scotts of Buccleuch; the actual copy of the Statutes of the Order of the Garter illuminated on vellum sent by Henry VIII. to James V. of Scotland; a Book of Heroes of the Thirteenth Century; the protest of the Bohemian nobles against the burning of John Huss and Jerome of Prague, which is in the possession of Edinburgh University; and a little gold signet found during some excavations at Kinross in 1829, and bearing the arms of Joan Beaufort, daughter of John, Earl of Somerset. Those of them who were collectors of books would find a fair selection of the heraldic works which had been published in this country, and had they had a little more time and space at their disposal he did not think it would have been impossible to have got together a complete collection. The facsimiles of Scottish seals, which were exhibited, showed that Scotland was not behind her neighbours in the early ages in respect of the art of seal engraving, and was perhaps the clearest and most complete proof that was extant of the artistic vitality of the Scottish nation from the thirteenth to the sixteenth century. Mr. Paul then gave a few observations on the miscellaneous objects in the exhibition, and directed the attention of his audience to the series of sketches illustrating the heraldic features incorporated into the architecture of some of the principal mansions in Scotland. To those whose tastes inclined to the splendour and solemnity of State ceremonial, the section of the decorations and the various orders of knighthood lent by the Lord Chamberlain could not fail to be attractive. Mr. Paul also dealt with the exhibits of stained-glass, metal and needlework, china and rubbings from heraldic brasses.

THE PROGRESS OF ARCHÆOLOGY.

THE Antiquarian Section of the Royal Archæological Institute was opened with an address on the "Progress of Archæology," by Dr. John Evans. At the outset he remarked that they might congratulate themselves that several of the distinguished members of the Institute who so much contributed to the success of the Congress of 1856 in Edinburgh, were still alive to take an interest in their proceedings that day, even though they might not be bodily present among them. It seemed to him that a few words on the progress made in archæological science during the last thirty-five years would not be out of place on the present occasion, especially when it was borne in mind that no inconsiderable part of that progress was due to the labours of Scottish antiquaries. One vast and interesting archæological period affording a new domain for the researches of both geologists and antiquaries, who met there upon a common ground, had within that time been, he might say, discovered, and the Palæolithic or River-drift period now demanded from the archæologist as much attention as the Neolithic or Surface-stone period. Not only had the existence of Palæolithic man been proved in England, France, Spain, Italy and other European countries, but strong presumptions had been raised as to his having left remains of his handicraft both in Northern and Southern Africa and on the eastern coasts of Hindostan. Closely allied to this River-drift period, but in many cases representing a somewhat later stage in the Palæolithic age, was what had been termed the cave period, when the now northern reindeer formed one of the principal means of subsistence for the early hunters of the south of France. In this department vast accessions to their knowledge had been made during the past thirty-five years. Magnificent collections of the relics of these early cave-men had been added to the British Museum, mainly through the liberality of the late Henry Christy; and the Blackmore Museum at Salisbury, rich in prehistoric antiquities, had sprung into existence since they met in Edinburgh. Between the latest phases of the Palæolithic or River-drift period, and the earliest of the Neolithic or Surface-stone period, there existed a gulf which, notwithstanding all efforts that had hitherto been made, had not as yet been satisfactorily bridged over. Their knowledge, however, of all that related to the Neolithic period had materially increased since 1856. The "Proceedings of the Society of Antiquaries," both of London and Scotland, as well as of the Archæological Institute and the British Archæological Association, all testified to this increased interest, and the consequent advance of knowledge. Among local societies that had specially aided in illustrating the Neolithic period, he might venture to cite that of Ayrshire and Galloway. The development of their knowledge of the Bronze period had kept pace with the advances in other departments. Dr. Evans then touched upon the lake-dwellings of Switzerland, and afterwards briefly considered the immense advances that had within the last quarter of a century been made in their knowledge both of the pre-classical antiquities of Greece and Rome, and of the early history, languages and archæology of Assyria, Egypt and the Holy Land. Returning to our own country, he remarked that so far as Mediæval antiquities were concerned the progress that had been made had been mainly in the direction of architecture; and it was not a little singular that this progress had been to a fearful extent accompanied by a destruction of Mediæval architectural remains under the pretext of restoration. Either from a desire of producing a uniformity, which in reality never existed, or of showing their own taste, architects had sentenced many of the most interesting features of our ancient ecclesiastical buildings to destruction, while much of the architectural history of the past three centuries had been ruthlessly destroyed. The singular hankering of so many of the clergy of the Reformed Church of England for all that savoured of pre-Reformation tastes and practices had not a little conduced to the obliteration of many an interesting feature in our churches, the destruction of monuments subsequent to the sixteenth century, and the melting down of Elizabethan and seventeenth-century plate. Perhaps at the present time some feeling of remorse was creeping over those who had wrought so much mischief in the past, and in some degree the plague of restoration was stayed. One of the most important handmaids of history was the science of numismatics; and though our Jubilee coinage did not testify to any advance in the art of coining, our knowledge of the former coinages of this and other countries had of late years materially increased. In heraldry no special advances had been made, though the works of Boutell and others had helped to popularise the subject. The general advance in antiquarian knowledge, the enlightened awakening to the interest that attached to the past was in the highest degree satisfactory, and not the less so that so much of scientific method had of late years been introduced into the study of archæology.

THE NATIONAL LIBRARY OF IRELAND.

THE annual report on the new library erected by the Government in Dublin states that it is fulfilling the object for which it exists, and the utility of the library seems likely to be increased. The librarian, Mr. William Archer, says:—

I may, I trust, be forgiven if I take this opportunity to place on record my great personal satisfaction that at last the National Library of Ireland finds itself in this new and fine building, adequate (when the other wing shall be erected) for its housing for many a year to come, and eminently fitted for its purpose as regards economy of storage space (which, as compared with other modes, becomes more than threefold augmented), convenience of approach to the books, shortening of distances, mitigation of physical exertion (including abolition of the use of ladders) and ultimate saving of time. That satisfaction is naturally enhanced by the reflection that I myself may claim a fair share of the credit of those structural changes from ancient and established custom, handed on from generation to generation; changes which I had from time to time, for ten years or more, urgently advocated both in print and by correspondence, bringing the same beneath the notice of the governmental authorities, men of public eminence, and home and English architects, with quite a number of whom, as intending competitors, I afterwards personally discussed the whole question—efforts which, I rejoice to know, were at last not without their influence. The great prominent and all-essential feature of those changes consists in the separation, in a large and commodious reading-room, of the readers from the books, and the placing of the latter, in lateral wings hard by, on presses standing across the floors and only three feet asunder, and of such a height only as to be within reach of the

arm and of the eye without the use of ladders, approach being had to these, tier over tier, by fixed (straight) stairs, this system carrying with it all the before-mentioned advantages. In fact, on a space of ground only about equal in area to that of the circular reading-room of the Library of the British Museum, there has grown up a building with a large and a smaller (ladies') reading-room, affording accommodation for some 250 readers, seated at one time (if needful), a trustees' board-room and private offices, and further capable of containing in the wings, when the accessions to the collection arrive, about two-fifths of the number of volumes at the present moment in that great repository, and this accomplished simply by utilising for storage of books, not the superficial area of the walls, but by taking advantage of the internal cubic space, which in so many library buildings is left a mere useless vacuity—an objectless squandering of space.

I would here express my thanks to our architects, Sir Thomas N. Deane & Son, not only for the readiness with which they at all times, when practicable, fell in with my suggestions, but also for the courtesy extended to me from the earliest beginning onwards, and the trouble taken by them in entering into minor details in their adverse as well as favourable points of view.

WATER SUPPLY OF LONDON.

A PAPER was read by Mr. A. R. Binnie, engineer-in-chief to the London County Council, at the Congress of Hygiene, in which he said :—

A good water supply, forming as it does the basis of all our modern sanitary science, is deserving, in a meeting such as the present, of the most careful consideration. And in the forepart of our inquiries on the subject it cannot be denied that, however obtained and however treated from an engineering point of view, we must, in the first instance, obtain a water of good quality and unimpeachable as to purity. At first sight this may appear almost a truism, but, unfortunately, we do not find it to be either universally admitted or always observed in practice. For this we have to look to the great and almost general result of our modern modes of life and civilisation, which tends more and more to aggregate our population towards large centres of wealth and industry, and these we observe are generally situated on the banks of important rivers or in river valleys not far distant from tributary streams. Not only are thickly-inhabited areas in themselves improper sources of water supply, but they are also directly the cause of pollution to the streams and rivers which flow through them. Consequently we find many of the large towns of Great Britain which are governed by municipal corporations, such as Glasgow, Edinburgh, Lancaster, Manchester, Liverpool, Halifax, Bradford, Leeds, Belfast, Dublin and many others, resorting at great expense to uncultivated mountain tracts, almost uninhabited, and bringing the water from great distances so as to obtain a pure and uncontaminated supply. When, therefore, we occasionally see large towns and cities which have not considered it necessary to take these precautions or to incur the consequent expense, but still continue to drink the water of rivers largely polluted by the more or less clarified sewage and the manure of populous areas, we are led to ask ourselves the question whether the large expenditure of capital that has been incurred in certain cases to obtain a pure water supply has not been an entire waste of our resources. There can be little doubt that human beings can, for a considerable time, drink with impunity water largely contaminated with the excreta, both solid and fluid, of healthy persons, and that they are able to do so with impunity and without loathing and disgust appears to be due to ignorance and apathy on the part of the water consumers and to the power which rivers possess of apparently destroying and veiling the more gross and palpable polluting substances. There are some persons, no doubt, who teach that running water has the power of entirely destroying sewage and other polluting matter which may pass into it ; but there are few, let us hope, who would say that we can with safety drink water which has been polluted with the excreta of persons suffering from cholera, typhoid, smallpox and similar diseases, and yet this is practically the position taken up by those who advocate unreservedly the propriety of deriving supplies of drinking-water from rivers on the banks of which, at no great distance, are situated large towns, for sooner or later we must expect epidemics to arise even under the most careful management. Of two facts we may feel quite confident, first, that water subject to pollution is a very potent factor in the spread of disease ; and, second, that there is, perhaps, no better mode of introducing into the human system any substance which it can absorb than by drinking it in the form of a solution. This being the case, it almost follows as a natural consequence that the utmost care should be taken to guard our supplies of drinking-water from contamination, and yet we see persons around us who shut their eyes to observed and well-known facts and speak of the teaching of science and the experience of the world as sentiment, and who continue to force upon a large number of their fellow-creatures supplies of water contaminated with the excreta of millions of men and animals. That wells are frequent sources of death and disease due to their contamination by house-drains is too patent to require a word of remark, and yet it required the cholera outbreak of 1849 and the death of some thousands of persons to impress the fact on the people of London. And it appears to be forgotten that to drink river water polluted by sewage cost London in the cholera outbreaks of 1854 and 1866 the deaths of over 16,000 persons. That people will go on for years drinking a supply contaminated by infiltration from graveyards, notwithstanding frequent warning, is proved by the outbreak of enteric fever in 1888 at Cradley, which caused 16 deaths in 113 cases. The case of Lausanne, in Switzerland, in 1872, proves that typhoid fever can be commenced by spring water flowing miles underground from a neighbouring valley. The cholera outbreak in Spain in 1885 showed that generally the disease passed down the valleys, decimating the towns which drew their water from the rivers, but passing those which were independent of the rivers and had pure and uncontaminated supplies. In India the author has seen a town in which cholera had become endemic almost entirely freed from that dire disease, simply by giving up the water supply derived from a popular drainage area and resorting to a purer and uncontaminated source. And the outbreak of last year of enteric fever in the districts of Stockton and Middlesbrough and Darlington, which derive their water supply from the river Tees, proves that the germs of that disease are not destroyed in their passage for over thirteen miles down that river from Barnard Castle. All these are cases in which chemical science is of little assistance, as it is powerless to detect the germs of disease ; it can tell us of the presence of organic matter, but without a careful inquiry into the previous life history of the water, it cannot pronounce that under all circumstances it is a safe and pure drinking water. Nor from the experience of Valencia in 1885 can we place much dependence in sand filtration as an effectual preventive of disease ; sand filtration may arrest the living germs, but is unable apparently to stop the passage of the minute spores from which they spring. The precipitation and clarification of sewage effluent by chemical agency also can hardly be relied upon, as it merely abstracts about one-fifth of the more solid impurity, leaving four-fifths of the dissolved organic matter to flow off into the river. What then are we to expect from the continuance of supplies to large cities from sources so polluted, but that such cities may go on for years perhaps boasting of the chemical purity of their water and their low death-rate, forgetting that the constitutions of their water consumers are being gradually prepared, by continually drinking small quantities of diluted sewage, to receive the germs of some violent epidemic which sooner or later will visit the sources of supply, and then will follow such an outbreak of death and disease as will cause consternation throughout the land ?

BEHIND THE SCENES.

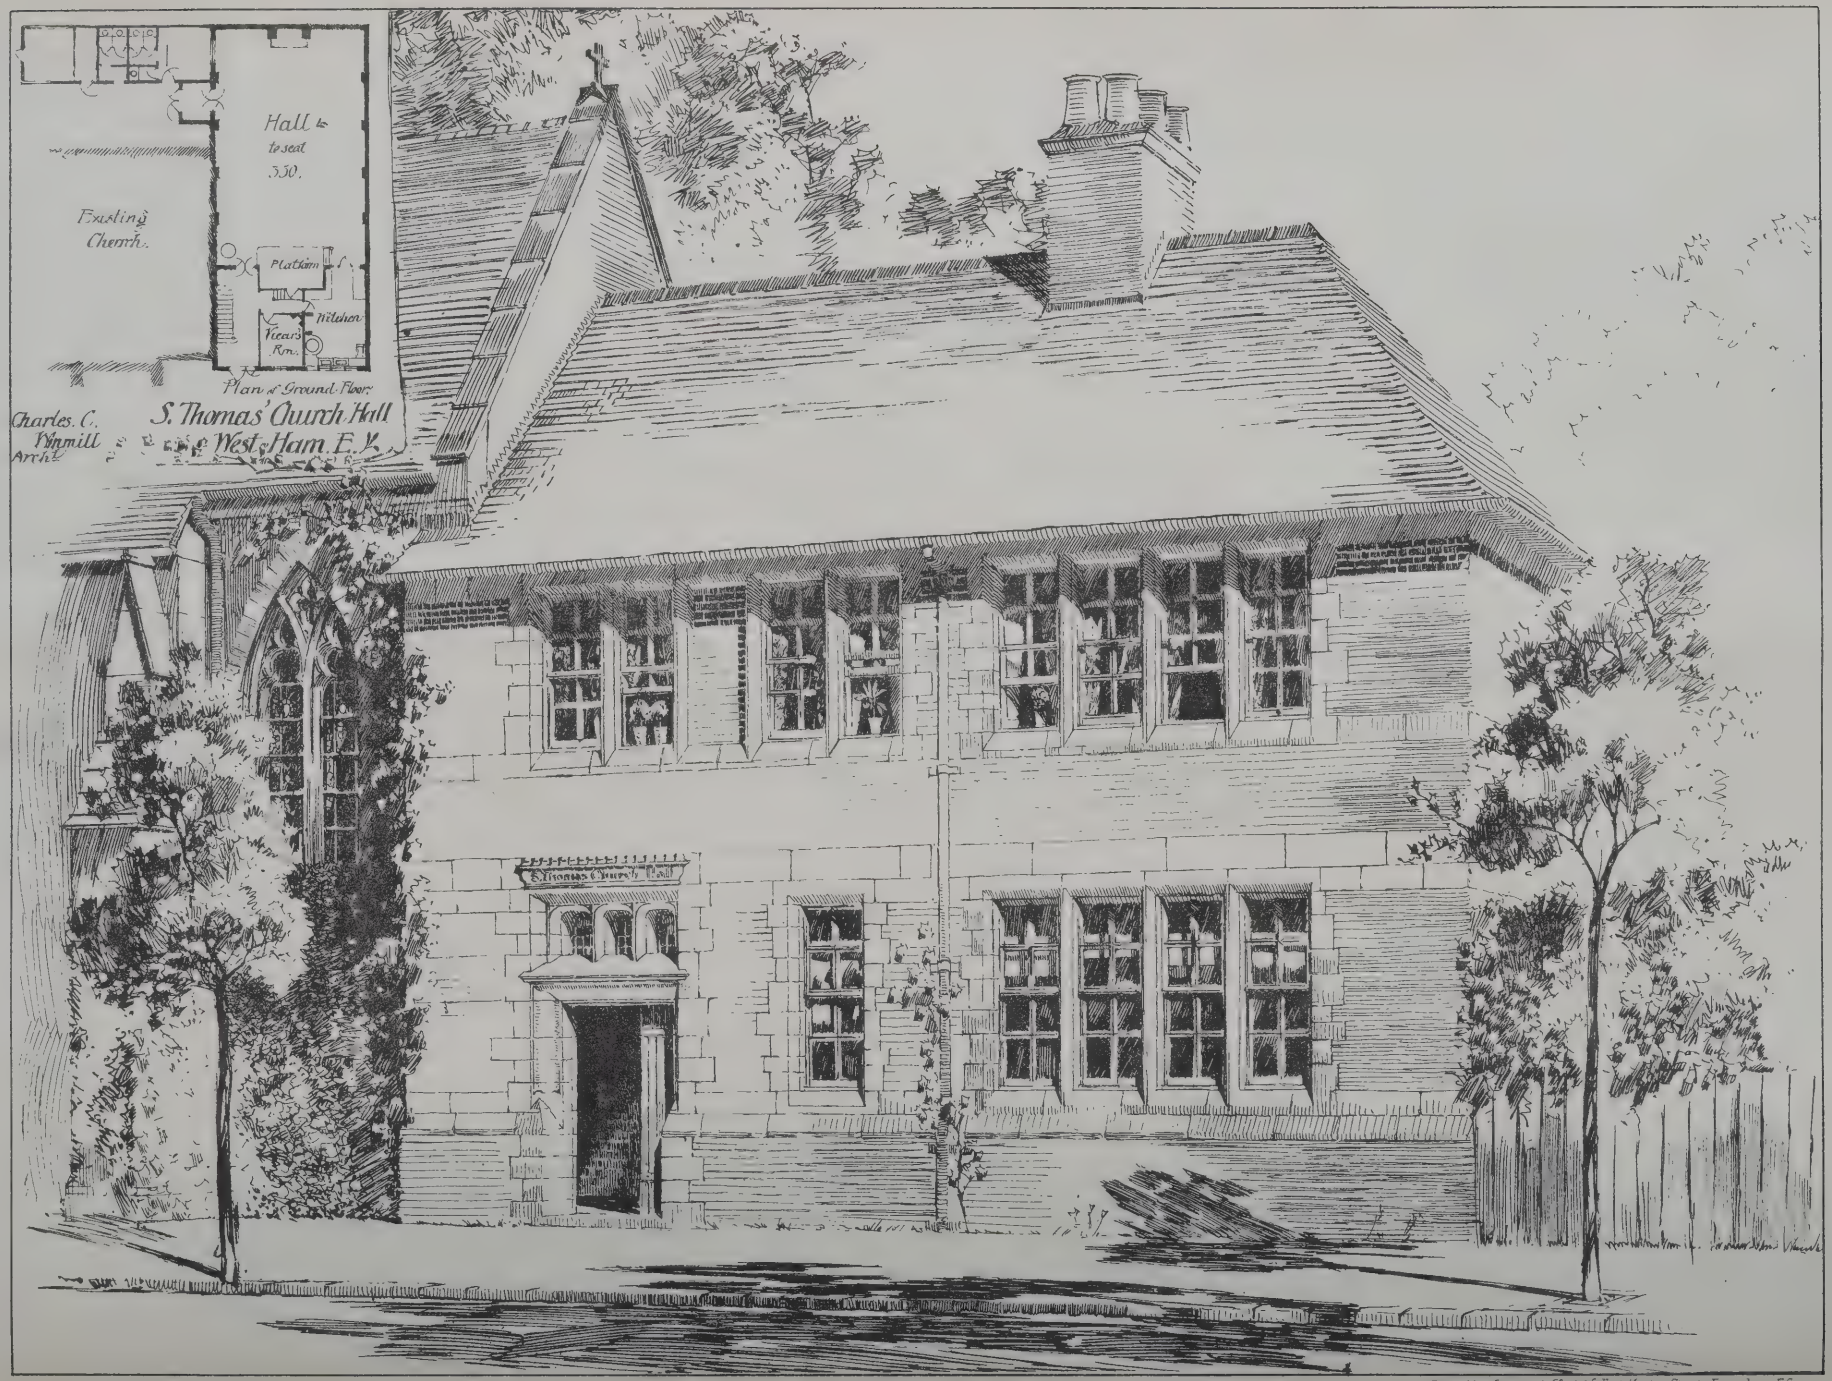
IN the paper on "The Sanitation of Theatres" read by Mr. Lennox Browne, surgeon, before the Congress of Hygiene, he remarked that of late years much attention had been given to the comfort and even luxuries of the theatre-goer, and to the protection of places of amusement from fire, but little care has been bestowed on the sanitary arrangements, especially below the stage and behind the scenes, as well as in the cloak-rooms, &c., of the auditorium. The majority of these defects are structural. Dressing-rooms are often quite inadequate, faulty in situation, in air-space, in ventilation, in the number of windows and in water-supply. Water-closets and urinals are frequently placed in improper situations, bad forms are used, and sometimes the workmanship is at fault. They are often ventilated into dressing-rooms, refreshment-rooms, lobbies, staircases, and even on to the stage. Ventilation is frequently unprovided for in rooms behind the scenes. Various expedients are adopted. Even with the best forms of ventilation the source from which the "fresh" air is obtained is often impure. The carelessness of the *employés* in matters of sanitation required constant supervision. The majority of the defects are of structural origin, and hence it is impossible to prevent these from being constant sources of danger. The effects produced on the health of the audience were theatre-headache and theatre-diarrhœa ; and of the actors were sore throats, loss of voice, typhoid fever, so-called rheumatism, and habits of intemperance. Certain theatres are recognised in the theatrical profession as risky places to play in, from the liability of illness being engendered. He contended that the authorities should recognise the necessity of framing regulations for the sanitary arrangements of theatres and music-halls, and should make their periodical inspection to this end of no less importance than that of the prevention of fire.

Dr. Dolan (Halifax) said that he had traced many attacks of typhoid fever to the insanitary state of theatres.

NOTES AND COMMENTS.

It is so commonly concluded that diphtheria is mainly caused by defects in houses, it is well to put on record the declaration of Dr. Tripe at the Congress of Hygiene. After the long experience of thirty-five years as medical officer of health in Hackney, he ascertained that there was no evidence that insanitary conditions of houses caused the disease, although they might predispose to it. Now, diphtheria has been one of the maladies on which panic-mongers have thriven, and it would be difficult to estimate the losses which architects have sustained because of the prejudices arising from the supposed connection between sore throats and houses. Dr. Edward Seaton, at the same meeting, explained that diphtheria was independent of what are ordinarily called sanitary conditions. A Belgian, Dr. Schrevens, considered gamecocks and Italian fowls had much to do with originating the disease. Dr. Adams said the organism flourished in certain soils, and was driven forth to destroy by sudden rainfall or lowering of barometric pressure. Nobody dared say that the disease was even remotely caused by architects and builders.

Anybody who is eager to be remembered and has a thousand pounds to spare can secure that end by sending the money to the town clerk of Norwich. The Norman keep of the castle and the prison buildings are being transformed into a museum. There is not, however, enough money to complete the work. The president of the museum, Lord Walsingham, therefore, proposes that any donor of a sum of 1,000*l.* (which would suffice to convert and fit up one of the separate buildings) should be entitled to have the record of his donation permanently inscribed on the building, which should be called after his name. His lordship believes there are people enough who are connected by family ties with Norfolk and Norwich who would take advantage of such an offer. It would be far better if Norfolk and Norwich men could be induced to subscribe the money for the sake of the district. But we suppose it is safer to trust to human weakness. At the same time the proposal is enough to fill students of archæology with terror. Hitherto the names associated with museums have been those of men like themselves, but how can anybody enjoy a collection when over the door is seen the name of somebody that is only worth remembering because he was good for a thousand pounds?



Another section of the Paris Hôtel de Ville will soon be ready for the painted decoration—that is, the principal *salle-à-manger*. The artist will be selected by competition. The ceiling is to be adorned with a large circular painting and two rectangular paintings. There will be also eight paintings over the doors. The sum assigned for the work is 49,000 francs. The subjects are left to be selected by the competitors, but it is expected that there will be some unity between them, and therefore that a general idea will be manifested. The sketches are to be sent in not later than December 15, and they will be exhibited from December 20 to January 5, 1892. From those, three will be selected, and the authors will be invited to paint a part full size. The artist whose work is placed first will be entrusted with the work, the second will receive a prize of 3,500 francs, and the third one of 2,500 francs.

According to the annual report of the Dundee Institute, it is the opinion of the council that if the present energy, good feeling and interest in the work of the Institute continue to be shown, the prosperity of the past seven years will not only be equalled, but greatly surpassed. Last session's membership consisted of 49 members, 152 associates, and 7 honorary members. This year's roll contains the names of 50 members (2 having been elected and one resigned), 168 associates (23 having been elected, while 5 have resigned and 2 have died), and 8 honorary members (3 having been added to the roll, while 2 have been removed by death). There is expression of the Institute's loss caused by the removal by death of such men as Captain Adams and Mr. W. J. Small from the associate roll, and of Professor Carnelley and Mr. Patrick Allan Fraser of Hospitalfield from the roll of honorary members. Of Mr. Fraser's courteous kindness and unstinted devotion to art the Institute has had rich experience, and of Professor Carnelley's devotion to science in its bearing upon the health-conditions of life the Institute has received lasting proofs. The balance in hand has been diminished from 60*l.* 5*s.* to 41*l.* 11*s.* 4*d.* An analysis of the account shows that while the income is practically the same, the council have entered upon some experimental work by way of providing a library and consultation-room and adding to the attractions of the conversazione. Extra prizes to competitors and additional advertising of the lectures will account for the remainder of the increased expenditure. The conversazione of the session was held in the Victoria Art Galleries. Mr. C. Ower, president, occupied the chair. The arrangements for viewing the pictures and for listening to the programme of speeches and music were on the same lines as on the previous occasion.

The Louvre is about to lose a work that was most interesting, although no more than a cast: this is the copy of the chimneypiece in the Hôtel de Ville, Bruges, which is one of the most remarkable survivals of Flemish Renaissance, and is well known by the aid of engravings. Among the numerous statuettes introduced are figures of Charles V., Maximilian, and Mary of Burgundy. The space occupied by the cast is required for other examples of Renaissance art, and moreover only original works are now considered as worthy of the Louvre. The chimneypiece will be transferred to the Trocadéro, where it will be in its right place as part of the series illustrative of architecture and decorative sculpture.

The Worcester City Council are likely to adopt stringent measures for the prevention of the deposit of refuse on building sites. The medical officer in his last report says:—"There has been one matter forced upon my attention, which is in my opinion a serious one. That is, the manner in which old gravel-pits are being filled, and in one instance low-lying ground has been raised, by throwing in street sweepings, the contents of ash-pits, the refuse of gardens and even the contents of privies. Much of the land thus made is presumably intended for building purposes, and I need hardly point out how very injurious an atmosphere would be drawn into houses built on such a foundation. There is a by-law in force in your city which deals effectually with such made ground, and it is not a great presumption to suppose that the owners of these sites and the builders are fully aware of the existence of such a by-law; but if so, on what principle are they acting in allowing to be deposited these vegetable and noxious materials on a spot which, if meant for building land, must be cleared of this rubbish before houses can be erected? Such conditions, if allowed, are just those that lead to bad health and want of vigour, without definite illnesses; but this chronic bad health permits its possessor to succumb to disease, which, under good sanitary surroundings, would have been successfully resisted." At the discussion of the subject the members appeared to be unaware of the existence of the by-law referred to by the medical officer, and apparently no use was ever made of it. The consideration of the abuse is left to the Health Committee, but the Chamberlain warned the Council to be careful not to get into difficulties. According to him the refuse must be put somewhere, and the best thing they could do was to provide another place in which rubbish might be deposited.

Under the direction of M. Vaudremer a church is being erected in the Rue Bizet, Paris, for the use of Orthodox Greeks who up to the present have been obliged to worship in the resplendent Russian temple in the Rue Daru. The cost of the new building will be defrayed by M. Stefanowich Schilizzi. The construction will cost at least 600,000 francs, and the interior decoration is likely to need a similar sum. The church is cruciform on plan, the central part being surmounted by a dome. The Greeks who follow the Roman rite have also their church in Paris, the old building of St. Julian le Pauvre having been assigned to them.

PAIR OF HOUSES, BURNT ASH HILL, LEE.

THIS pair of houses are now being built. The walls up to the first-floor level are faced with red bricks, and above that with "rough cast." The roofs are tiled. The mullioned windows will be filled with lead lights, and the woodwork generally will be stained dark brown. Messrs. BALAAM BROS. are the builders who are carrying out the work, and Mr. R. A. BRIGGS, A.R.I.B.A., of 2 Devonshire Square, is the architect, from whose drawing the illustration is taken. The cost of the houses is 1,850*l.*

ST. THOMAS'S CHURCH HALL, WEST HAM, E.

THE DEPARTMENTAL ART SCHOOLS.*

DURING the year ending August 31, 1890, 4,324 elementary schools, with 928,357 scholars, were taught drawing under the regulations of the Department; 708 of these schools were in Scotland, and 48 in Ireland. This was an increase of 505 schools and 79,559 scholars, or 13 per cent. and 9 per cent. respectively, as compared with the numbers in 1888-89, when 3,819 schools with 848,798 scholars were examined.

The grants for drawing during the year 1889 amounted to 54,011*l.* 6*s.* 11*d.*; in 1890 to 70,035*l.* 12*s.* 2*d.*; and the number of schools gaining the awards "Fair," "Good" and "Excellent" respectively were 821, 2,087 and 1,215.

Up to the date August 31, 1890, to which the foregoing statistics were made up, the effect of the Code of the Education Department for 1890, which made drawing compulsory in all schools except those which were specially exempted, had not been much felt, as this condition of the grant is not to be enforced in respect of any annual grant falling due before August 31, 1891. But latterly the effect has become very evident, the number of schools taking drawing having risen from 4,324 to about 9,500 at the end of April 1891. In view of he above-mentioned article of the code we deemed it necessary not to insist for the present on the possession on the part of the instructor of a certificate in drawing as a necessary condition of the school earning the grant for drawing. The effect of this relaxation will be carefully watched, and we trust that the managers of schools will not allow it to be abused, but will themselves see that when the teacher or teachers of the school are not qualified to give instruction in drawing, proper assistance is secured from the outside. This can generally be readily obtained from a school of art or art class in the neighbourhood.

We have also, with the sanction of the Treasury, by minute dated June 5, 1890, offered grants, in accordance with the recommendation of the report of the Royal Commission on Technical Instruction, for manual instruction in elementary schools, and in organised science schools for young lads. Briefly stated the conditions are that the instruction shall be in connection with drawing; on a graduated course in the ordinary tools used in handicrafts in wood and iron; and out of school hours in a properly fitted workshop. We are glad to find that already the country is taking advantage of the aid thus given for manual instruction, 102 schools with properly equipped workshops having been placed in connection with the Department up to April.

The gradual assimilation of the conditions under which the grants for instruction in art are made to schools of art and to art classes, together with the progress made by art classes which are becoming centres for instruction in many of the more advanced branches of art, make it desirable to alter in some respects the form in which our report has hitherto dealt with these institutions. In previous years the statistics of schools of art have been separated from those of art classes, but in the present report such statistics have been brought together, and rendered not only more concise, but, we believe, better adapted for giving a general view of the present position of the art instruction aided by this Department.

The number of art schools and classes examined in 1889 was 1,114 as against 1,182 in 1890, showing an increase for 1890 of 68. The number of students under instruction in them was 88,969 in 1889, as compared with 88,833 in 1890. Of these 76,467 were of the industrial class as defined in the Science and Art Directory, while 12,366 were of the middle class.

* From Report of Department of Science and Art, 1891.

Of the 245 art schools and branch classes and 937 art classes examined last year 203 schools and 772 classes were in England and Wales, 24 schools and 124 classes in Scotland, and 18 schools and 41 classes in Ireland. The number of students who sat for examination was 51,813 in 1890, or 3,098 more than in 1889, when the number was 48,715.

The total number of papers worked by these students in 1890, both in the 2nd and in the 3rd grade examinations was 82,208, of which 35,529, or 43·21 per cent., were successful, as compared with 76,704, of which 39,204, or 51·11 per cent., were successful in 1889. But in addition to the papers worked by these students 13,143 papers were worked by external candidates, and candidates from classes not receiving payments on results, of which 5,611, or 42·69 per cent., were successful as against 7,970 similar papers worked in 1889, of which 4,401, or 55·21 per cent., were successful.

Of the 2nd grade papers worked in 1890 by students of schools or classes, there were 64,521, of which 28,747, or 44·55 per cent., were passed either for 1st class or 2nd class, whilst in 1889 there were 60,296, of which 33,209, or 55·07 per cent., were passed.

17,733 papers and exercises in the 3rd grade examinations were worked in 1890 by students of schools and classes, and of these 6,799, or 38·34 per cent., were passed, as against 16,408 in 1889, of which 5,995, or 36·53 per cent., were passed. The numbers passed in the 3rd grade examination in drawing in outline from the cast, in drawing from models in light and shade, and in shading from the cast show a satisfactory increase. The numbers of candidates, and successes in advanced perspective are nearly the same as last year. In outline drawing from plants, which is considered to be specially valuable as a study preliminary to designing for textiles, a large increase of candidates and successes has taken place. In painting in monochrome, 240 out of 748 were successful. In drawing from the antique, the number of candidates and successes has considerably increased; and in drawing from life there is also an increase. The progress in these two latter subjects shows that the instruction of the schools is generally reaching a higher level year by year. Sciography and painting in monochrome, however, show a decline in the number of candidates. The numbers in the 3rd grade examinations in modelling, which it is necessary to hold in South Kensington, are less numerous than in the drawing or painting subjects, and are about the same as last year.

In 1890, 22,666 students submitted 135,651 works, executed in the schools during the session, for examination at South Kensington. This is a smaller number than was submitted in 1889, when 23,160 students sent up 137,909 works. Though, however, under the influence of recent rules excluding the more elementary works, the number of drawings, paintings and models sent up has declined, the number of meritorious works in the advanced sections has been fully maintained, as is shown by the fact that 3rd grade prizes were awarded to 1,418 students of schools of art, as compared with 1,155 in 1889.

Works have again been submitted to the Department for examination from Barbados, Natal, New South Wales, Queensland, South Australia, New Zealand, and the Isle of Man, Guernsey and Jersey. As the vote for the Department does not apply to these places, the expenses of examination are borne by the local authorities.

457 art class teachers' certificates have been issued, besides 46 art masters' certificates of the first group of the 3rd grade, 17 of the second group, 3 of the third group, 1 of the fourth group, and 1 of the sixth group, during the past year. Altogether 1,991 art class teachers' certificates have been taken.

Those portions of the reports of the examiners on the third grade art examinations which are of general interest are reprinted here. The full reports, which contained, in addition, criticisms on the works of individual students, have been circulated to the schools:—

Perspective.—The solutions of the practice paper for which 2nd classes were awarded are generally very good, and, within the limits of attainment required for such problems, show that the teaching of the more simple portion of the subject has been thorough, and well understood by candidates. The problems in reflections are decidedly better worked than in previous years. The general quality of the work for which 1st classes were awarded is good. Reflections in a horizontal surface are generally well drawn, but the teaching seems (with a few exceptions) to have been carried no further. In both sections of the theory paper it is again to be remarked that candidates are far more apt at describing processes than at stating the reasons underlying them. But there is a notable improvement in terseness and accuracy of expression, and an agreeable absence of irrelevant matter as compared with former years.

Sciography.—A more even measure of attainment is observable in the exercises worked this year than in previous examinations, the number of candidates who display a useful knowledge of straightforward processes being distinctly higher. On the other hand, there are, as probably will always be the case, but few really excellent papers.

Design of Ornament.—In Section I., although a fair number of those passed showed sense of fitness to the peculiar conditions of scale and material (and it may be granted that to design a book-cover in a thoroughly satisfactory way is remarkably difficult), there was too large a proportion showing an absence of the necessary perception of scale and adaptability to conditions of workmanship, into which it may be said even the best designers would be apt to fall if they designed at a distance from, and in ignorance of, the peculiar requirements and limitations of the object and the materials and processes in which the work was intended to be carried out. Thus in regard to the designs for book covers scale was often lost sight of in the choice and details of the ornament adopted, and in the result the effect was that of a design for an ordinary panel in decoration of that prevailing but indeterminate kind which only the closest study of the relations between design and material, beauty and use, will correct. In most cases where lettering was used it was of a degraded and tasteless type, and was seldom regarded as an essential and valuable element in the design.

In Section II. the results showed a great want of simplicity, both in sense of form and ornament, suggesting rather that the designer's object was to produce a showy drawing rather than a workmanlike design for a definite and useful object. A sense of construction and adaptation to conditions was often wanting, especially in the fitting of the handles, always a difficult point. The examiner's impression is that, as a rule, the competing works indicate that the students' eyes have been too much fed upon late examples of pottery and plate, in which the primitive purpose is often secondary to the display of ornament. Ornament, of course, may be rich and abundant, but it should never cease to express the form it belongs to.

Section III. (designs for wall-papers and textiles) showed, on the whole, the most promise, and (as the proportion of passes to papers sent in indicates) a higher average of ability in meeting the conditions of the subject. In the designs for textiles this was perhaps more so than with the wall-papers. In many cases the repeat was not sufficiently worked out or its effect tested by repetition of its main features on a small scale, although in other cases there was a commendable endeavour to meet this difficulty.

Design Composition from a given Figure Subject.—Of a total of 95 drawings under this competition only one received the maximum number. As a rule, the designs showed the same vagueness and want of technical knowledge and sense of adaptability to decorative conditions and material, and the same bias towards pictorial conception and treatment of subject which the examiner has remarked before, and which, in his opinion, is more or less the result of the endeavour to teach designing apart from the practice of handicraft. The vase designs showed more effort after ornate effect and complexity of form rather than simple taste and fitness for the purpose, and even where a sense of the material and purpose was shown the designer appeared to have been led astray by bad models, or had suffered from the contemplation of late and debased types of form. Any imitation of the later Renaissance types in decoration is often fatal, and only results in the reproduction of the worst faults and tendencies of the originals without their redeeming qualities of grace and richness. The designs intended for book illustrations and Christmas cards again, especially the former, showed a want of the sense of the relation of the design to the actual page of the book, as well as (generally) a want of adaptability to any process of engraving; many suffered from looseness of drawing and vagueness of conception; where legends or lettering were introduced it was seldom with any sense of making them form part of the design, and the characters themselves were generally of an unfortunate type.

Architectural Historic Ornament.—The work done by students who have presented themselves for examination in the subject of architectural historic ornament is, I am happy to report, of a very satisfactory character, and such as it has been a pleasure to examine. Not only has the best work been very good indeed and the best drawing excellent, but the general level both of knowledge and draughtsmanship has been extremely creditable. I have noticed some indications of a defect which is a natural one to arise among students of decorative art, namely, that some candidates are far better acquainted with individual ornaments, such as the honeysuckle or the egg and tongue, than with their relation to the architectural features of the buildings where they were anciently used, but I do not think this defect has shown itself so prominently this year as it did last year; and apart from this I am gratified to find the students well informed and able to draw what they wish to illustrate with precision and spirit. Taking the papers as a series the questions designedly spread over a wide range, and they have brought out evidence of very varied studies.

Elementary Architecture.—The work done by the candidates in elementary architecture in 1890 resembles closely that of 1889. The students sitting for a second class seem to me again more uniformly well prepared. The drawings of buildings known to candidates are again in many instances good.

Architectural Design.—In transmitting my return of the marks obtained by the students who took the examination in architectural design, I am sorry that I can hardly speak so favourably of them as a whole as I could last year. This is in part no doubt due to a larger number of students having competed with the result of lowering the average. I notice especially many defects in what are almost the elementary rudiments of architecture. The designs to which I have been able to award high marks are in many cases very creditable and well-drawn, and in several instances I have noticed with pleasure that the candidates have availed themselves of the opportunity which the problem afforded them of attempting a little interior design. In conclusion, I consider the planning on the whole better executed than last year. In not a few cases, it is true, the candidates have not shown themselves familiar with obvious matters; some of them, for example, have not provided the rooms of their building with fireplaces, but on the whole they have understood the subject and treated it with intelligence; and many of them have succeeded in giving some amount of architectural character to their plans.

Elementary Principles of Ornament.—The work done for the award of second classes shows that great credit is due to the masters for the excellence of their instruction and for their selection of the pupils for this examination. There is scarcely a single instance of those pupils who are totally ignorant being sent up for this examination. Some of the best candidates examined for the award of first class have attained a high degree of excellence, and, with but few exceptions, those who have passed have done fairly well. Few seem to be aware of the paramount importance of good proportion and graceful outline when these are left to their discretion.

Plant Drawing.—The standard in plant drawing this year is high again, the manner practised throughout almost all the exercises is good, and perception shown in most of them of the object aimed at by the exercise.

Time Painting from Still Life.—The work sent up in this section continues to show considerable artistic perception and ability, though no exercise this year has the charm of aspect of a certain number of works sent up in preceding years. It is satisfactory to see that a simpler and more direct manner of laying on the colour is pretty generally adopted, to the advantage of the work done, and that the profuse use of varnish and a treacley aspect is gradually being abandoned.

Painting in Monochrome.—The results of this year's competition seem to me encouraging. The average level of the work this year struck me as higher than last year. This was especially the case with regard to taste and colour. So far as the technique of painting is concerned, if there was nothing better than the best of last year's work there was certainly less that was very bad. There was still noticeable in the work sent in far too frequent a tendency in the pictorial rather than in the decorative direction.

Time Drawing from the Antique.—The general standard is somewhat lower than in former years. There are no exercises of superior excellence. At the same time the utterly bad are fewer in number.

Time Drawing from the Life.—The average in this section is very much the same as in former years; a greater excellence can well be expected, and ought to be achieved.

Drawing the Antique from Memory.—The examiner has again to express regret at the number of exercises not being greater in this branch of study, considering the very great advantages to be derived from the constant practice of exercising the memory. Of the drawings sent some are fairly good, but more general improvement can well be expected.

Modelling.—We think that the high average of merit reached last year has been maintained in most of the stages this year, though, as before, there are few works that are up to a very high standard of excellence.

The works submitted for the National Competition were examined by the following gentlemen, under the general superintendence of the Director and Assistant Director for Art, T. Armstrong and H. A. Bowler:—Messrs. E. J. Poynter, R.A., G. D. Leslie, R.A., W. F. Yeames, R.A., W. H. Thorneycroft, R.A., J. B. Burgess, R.A., H. H. Armstead, R.A., G. Aitchison, A.R.A., W. Morris, J. J. Stevenson, H. G. Harris, M.Inst.C.E., Walter Crane, Lewis F. Day, T. G. Jackson and Alan S. Cole. The number of works selected for the National Competition was 2,084. The awards consisted of 5 gold, 51 silver and 132 bronze medals, and 262 prizes of books gained by general students, together with honorary awards of 3 gold, 14 silver and 35 bronze medals, and 47 book prizes obtained by students of the training classes of the National Training School. From the reports of the examiners it is only necessary to give here such extracts as are of general interest.

Modelling. — Examiners: H. H. Armstead, R.A., H. Thorneycroft, R.A.—In the models from the life presented this year there is no falling off, but some improvement. The copies from the antique, however, are not considered satisfactory, and the examiners are of opinion that in cases where the example, unlike the living model, may be used for an indefinite time, no

works should be allowed to come up which are not executed with the greatest care and finish. The examiners see with pleasure a notable improvement in the treatment of the living model in relief, and also in reliefs adapted from the round antique figures. It is to be hoped that this improvement may continue and become still more general, for such relief treatment is in the highest degree important in the decorative modelled work which it is especially the function of the Department to foster. In the stages of design there is seen more perception of the limitations of plastic art than heretofore, more skilful execution and more taste in arrangement with, here and there, invention. The busts from the living model are better than usual this year.

Mechanical Drawings.—Examiner: H. Graham Harris, M.Inst.C.E.—Although the number of drawings submitted this year is in excess of that of former years, yet there is no one work which is of exceptional merit, or which shows exceptional ability. The general standard is, however, on the whole, I think, higher than previously.

Painting from Still Life.—Examiners: G. D. Leslie, R.A., W. F. Yeames, R.A.—The examiners are of opinion that in this class of work there is very great improvement. More taste is shown in the choice of material and in the arrangement of it than heretofore, and in execution there is also a marked advance. Many of the studies now presented, to which no awards have been made, would have been thought much of in former years. It is to be remarked that with this general improvement there is no exceptionally brilliant performance such as is sometimes met with. The average is so much better this year that the adjudication was more difficult than heretofore.

Flowers and other Paintings.—Examiners: G. D. Leslie, R.A., W. F. Yeames, R.A.—The examiners note that there is a general improvement in the paintings of flowers; at the same time, one or two pre-eminently accomplished students in this kind of work are unrepresented this year. Generally there is more endeavour to render the light and tender qualities of the colour and surface of flowers, but this is sometimes sought at the cost of careful definitions of form.

Designs, Textiles, &c., Hangings, Carpets.—Examiners: E. J. Poynter, R.A., W. Morris, Walter Crane, Alan S. Cole.—L. P. Butterfield, of South Kensington School of Art, receives a bronze medal for his design for printed hanging. It would, however, have been more suitable for wall paper. Mere ingenuity not resulting in a pleasing whole is of no great value. They are gratified to note that the designs for small cotton prints from Manchester are all creditable and of a higher level than usual.

Damask Table-cloths.—The examiners wish it to be remembered that designing for damask table-cloths is one of the easiest forms of designing. Students would probably benefit by studying heraldic devices of Gothic times in order to realise the value of bold forms and the use of counterchange in two colours. Good napery patterns are to be found quite late in the seventeenth century. A decided improvement in this class of designs by students is apparent this year. The examiners note that the designs sent up for hand-made laces are not good enough for the very elaborate work in their execution. For the most part they are based upon the eighteenth-century patterns, many of which are derived from floral and ribbon designs for woven silks. It is a mistake to suppose that because lace work is necessarily limited by its process of manufacture that it is not to be identified with thoroughly characteristic and suggestive designs. The history of the art during the sixteenth and earlier part of the seventeenth centuries shows that such is not the case, and that it is possible to have good designs in spite of limitations as to method and material.

Wall-papers, Tiles, Mosaics, &c.—Examiners: W. Morris, Walter Crane, Lewis Day.

Wall-papers, &c.—The designs for wall-paper are on the whole remarkably poor this year.

Tiles.—The designs for tiles are good this year. It is a vicious practice to form patterns of animals in such a way as to make it difficult to note their real forms. Animals should not be turned into geometrical units.

Stained-Glass.—The examiners have to record that the stained-glass designs are poor, the majority of the designs showing little understanding of the requirements and technicalities of the process.

Designs for Pottery, Metalwork, &c.—Examiners: W. Morris, Walter Crane, Lewis Day.—With the exception of a hand mirror and a jewel casket the general run of designs for metalwork is faulty in style and somewhat wanting in originality; in other cases a great deal of labour has been wasted in inorganic and inappropriate ornamentation.

Antique Figure and Details, Drapery, &c.—Examiners: W. F. Yeames, R.A., J. B. Burgess, R.A.—The examiners think that generally there is some improvement shown in the works sent in this year in this stage, though there is nothing very good calling for special remark; neither is there a vicious tendency, but the work is fairly good all round. Among the drawings of hands and feet there are none of great merit.

Drapery Studies.—In the class of draperies on the cast the examiners see improvement.

Painting and Drawing from Living Model, &c.—Examiners: W. F. Yeames, R.A., J. B. Burgess, R.A., and E. J. Poynter, R.A.—Generally the painting from the life is not considered up to the usual standard. There is a tendency to loose, slipshod work, which the examiners regret.

Drawing of Full-length Figures (Life).—A very slight and sketchy manner, which leads to nothing, is in the opinion of the examiners becoming much too prevalent in some of the schools, and should be checked by the masters. A silver medal is given to a thoroughly well-studied, careful drawing by Renira Pollard, of South Kensington, and another to T. Stokes, of West Bromwich School of Art for a drawing from a model whose forms are unhappily meagre and poor. It shows evidence of careful study. In the National Art Training School, where good models are available, more care should be taken in the selection of them. There is a fresh tendency among some of the students to a rather loose kind of work, which ought to be discouraged. A silver medal is awarded to Harold Speed for a drawing with refined and tasteful treatment, wanting a little firmness, especially at the joints. The drawing by Albert Baker, which has a bronze medal, is good in action and vigorous in treatment, but somewhat smudgy. A silver medal is awarded to H. C. Fripp for a work which, though large in treatment, is carefully done. Although there are no drawings considered of high quality, a considerable number of fair works in this class have been sent up in which the *ensemble* of the model has been happily seized.

Time Studies from the Life.—The large set by A. Allan, of Glasgow School of Art, receives a silver medal. These drawings are of a very useful kind, and executed in a good manner, and the examiners are glad to note the attention he has paid to hands and feet. G. Davies, of Leicester School of Art (Hastings Street), for a set somewhat less good, receives a bronze medal. The drawings from National Art Training School in this stage are considered very good.

Painted Studies of Heads (17b).—These are poor. In this class there is a half-length figure of an old woman which has very good quality as to colour and value. There is another study of an old woman at work by a window which has similar qualities, but the examiners hardly look upon this as proper schoolwork. The heads from the training class are better.

Chalk Drawings of Heads.—Many of the works in this class are in the sooty manner so strongly protested against by the examiners in former years. There are no studies of hands and feet so good as those of former years.

BRISTOL CATHEDRAL.

THE death of Dr. Gilbert Elliot, Dean of Bristol, has inspired various biographical sketches. It was stated in most of them that the Dean was the chief promoter of the restoration of the cathedral, which he placed in the hands of the late Sir Gilbert Scott. It is needless to say the restoration was Mr. Street's work, and that some of the sculpture gave rise to an angry controversy. A correspondent of the *Times* claims the credit of originating the restoration for the present Archdeacon of Bristol, Canon J. Pilkington Norris. The writer says:—On Mr. Norris's appointment, in 1865, he not only found Bristol Cathedral naveless—the fourteenth-century rebuilding, for which the Norman nave had been demolished by Abbot Knowle, having come to a standstill when barely begun—but a negotiation between the Chapter and the Municipal Corporation of the city all but completed for the sale of a long slice of the site of the nave for the widening of the road, which would have absolutely prevented its ever being rebuilt. This transaction Canon Norris refused to sanction. The Chapter had gone too far to recede; but Canon Norris at once waited on the Council, showed them, to their astonishment, that the completion of their mutilated cathedral would be foreclosed for all time if the plan proposed was carried into effect, and had little difficulty in inducing the Council to rescind the agreement with the Dean and Chapter, and alter the line of the street so as to preserve the cathedral ground plot intact. Having thus secured the site of the nave, Canon Norris at once inaugurated a plan for its rebuilding. The Dean had wished for nothing more than the erection of a western porch or narthex, covering a small portion of ground; but he interposed no prohibitive obstacle to his canon's "wild scheme," and with his sanction and that of the Chapter Canon Norris obtained a design from the late Mr. Street and vigorously set about the task of raising the necessary funds. The matter was warmly taken up by the city and diocese, and we see the result in the fully-completed nave, with its western towers and elaborate north porch, the gift of the then mayor, Mr. Killigrew Wait. The first stone of the new nave was laid in April 1868, and it was opened for worship on October 23, 1877. The towers, one commemorating the episcopate of Bishop Butler, have since been raised to their full height. No injustice is done to the memory of the late

Dean by saying that he held himself entirely aloof from the rebuilding of the nave until it was all but completed. At that time a painful controversy regarding some statues of the "Fathers of the Church" on the north porch, which had disturbed the Protestant sensitiveness of a portion of the inhabitants of Bristol, which it is wisest now to forget, led the Dean for the first time to show any public interest in the work, and after the removal of the images which were the cause of offence he exerted himself energetically for its completion. But it is the simple truth that he was in no sense the originator or the chief promoter of the rebuilding.

Another misstatement deserves to be corrected. Whether Dean Elliot ever applied to the late Sir G. G. Scott for advice as to the restoration of his cathedral I cannot say. But that celebrated architect was never employed on any part of the building. The alterations referred to in the obituary, undertaken when there was no idea of rebuilding the nave, between 1861 and 1864, were carried out under local architects, Messrs. Pope & Binder. Much has been learnt as to cathedral arrangement since that time, and the wisest course for the new Dean, when appointed, to take would be at once to undo all that was then done, and treat the choir as a choir and not, as now, as a nave and choir in one. In the hands of a Pearson, a Blomfield or a Hodgson Fowler, Bristol Cathedral may be made one of the most beautiful churches in England.

AN EPISCOPAL VIEW OF RESTORATION.

THE opening address in the Architectural Section of the Congress of the Royal Archæological Institute at Edinburgh was delivered by the Bishop of Carlisle. His lordship said it had occurred to him, in considering upon what string he could most conveniently hang together some introductory remarks, that he might with advantage direct their minds to the subject of the treatment of ancient buildings. It would be remembered that although architecture was the subject which was to be dealt with in that section, it was not architecture pure and simple, but architecture in its relation to archæology. The most recent form of architecture was that adopted in the construction of the Forth Bridge, but he feared that he should have to rule a paper upon the architecture of the Forth Bridge out of order as not being connected with archæology. Ancient buildings alone were admissible into the discussions of that section, and some remarks upon the manner in which they should be treated might, perhaps, not be without their use. The first method of dealing with ancient buildings, and one which would probably be recognised as an important one by archæologists, was to leave them alone. Perhaps in some cases that recipe required to be applied in conjunction with another, viz. to take care that other people left them alone also. There were cases in which these two methods of treatment ought to be applied in the most rigorous and literal manner, and in which nothing more ought by any means to be done. They might take as a primary example some of the buildings of Egypt, buildings which combined in the most marvellous manner the reality of almost immeasurable antiquity with some of the appearances of the freshness of recent work; buildings which were the archæological heritage of the whole civilised world, but in which, according to the eccentric course of human affairs, this country had at present a special interest, combined with a special responsibility. He presumed that no one was likely to attempt to "restore" any of the Egyptian temples; to let them alone would probably be the universal notion of what was best for buildings such as those, though it might be well to add that the other consideration must not be omitted, viz. that care should be taken that others left them alone too. It was not pleasant to find that there was some fear lest national jealousies should prevent that absolute care for the safety of Egyptian monuments which all right-minded men desired. Archæology knew, or ought to know, no distinction of race. It mattered not whether the chief post was allotted to a Frenchman or an Englishman, provided only that there was some one who was endowed with real power, and who was competent for the work. He ought to qualify what he had said concerning the propriety of leaving such monuments as those of Egypt alone, by adding that of course care should be taken to guard against those causes of decay which existed even in Egypt. The remarks made concerning Egyptian architecture manifestly applied to countless other works in all quarters of the globe, not by any means excepting this country. In fact, wherever there was an ancient piece of architecture which had become a monument of the past pure and simple, there could be no question as to the method of treatment. Either it should be left alone, or, if that was impossible, such steps should be taken as would avoid its destruction, was the precept to be given. One difference between this country and Egypt was that in Egypt danger arose from the want of a master, or owner, with plenary powers; whereas in England the opposite peril arose, and a monument was sometimes placed in jeopardy by the fact that some one could prove to the satisfaction of the Law Courts that the monument in question was his in fee simple. So much for edifices which might be regarded as monuments pure and simple. It was far more difficult to define the proper method of treating buildings which were partly monumental, but partly also in ordinary use for the practical purposes of living men. Obvious examples were to be found in that city—Edinburgh Castle, Holyrood House, the church of St. Giles. He imagined also that in Holyrood House the *juste milieu* between leaving all alone and leaving nothing alone had been wisely kept; and though the change in St. Giles's Church from what it was in his own recollection had been great, perhaps even radical, still he thought that Jenny Geddes herself, if her spirit still haunted the scene of her great ecclesiastical achievement, would be disposed to grant that the change was "no so very bad." The fact was that the problem of dealing with ancient buildings which were still serving contemporary living purposes must of necessity be very puzzling, and in some cases perhaps actually impossible. Of one thing the architect might rest assured, that whatever course he adopted he would be severely taken to task, partly perhaps by men of his own profession, and still more confidently by that remarkably dangerous and inevitable person, the infallible amateur. There was perhaps nothing easier or cheaper than giving advice on a subject which one only imperfectly understood. His lordship illustrated the difficulty of which he was speaking by reference to the problem of dealing with Westminster Abbey consequent on the filling up of the Abbey with monuments and statues. A deadlock had been reached after full discussion and deliberation by six persons, presumably amongst the most fitted to discuss and deliberate in the whole kingdom. The most familiar and ordinary example of a building which was monumental, and something more, was to be found in the parish church. In Scotland the example of St. Giles's, of the Cathedral at Glasgow, and other interesting and beautiful churches here and there still used for divine worship, would show that a Scottish architect might sometimes be called upon to rack his brains in order to discover what was the treatment of any given building which should at once recognise its character as a monument to be conserved, and a contemporary building to be used. What he desired to press was that both these sides of the question must be considered. He must content himself, however, with asserting the living character of churches for the present era without endeavouring to indicate the manner in which this character was to be reconciled with the other, which presented them to us as precious monuments of a past we did not wish to forget. He had thus dealt with ancient buildings as divided into classes; those which were purely ornamental—the class most dear to the archæologist's heart, and those which, while partly monumental, had, nevertheless, living uses which the archæologist was at least compelled to tolerate. But this second class admitted of a subdivision which ought not to be neglected, because it, in fact, pointed to one of the most difficult questions presented to those who had in any way to deal practically with ancient buildings. He referred to the fact that many, perhaps the majority, of ancient buildings were the archæological records, not of one, but of several historical epochs. He was himself for more than ten of the best years of his life the custodian of such a building. Ely Cathedral, like most of our great churches, was not built by one architect or even by one generation. It was a monumental record of all periods since the Conquest, and it contained beautiful specimens of all schools of architecture—Norman, Early English, Decorated, with just a flavour of Sir Christopher Wren. When a building of that kind had to be meddled with—and meddled with it sometimes must be, let the advocates of leaving old buildings alone say what they would—most perplexing questions would necessarily arise. If they are dealing with a building which had one date, one style of architecture, one design, it was comparatively easy to put themselves in the position of the original architect, and to try to do what they thought he would have done, but this method obviously failed in the case of a building the history of which spread over centuries, and which was the result of the plans of architects who followed the admitted rules and methods of the days in which they lived, and who, it might be added, sometimes cut into each other's work with no fear before their eyes of a Society for the Protection of Ancient Buildings, and with no Lord Grimthorpe to tell them what was right and what was wrong. What was the modern architect to do? There had been no unbroken continuity of ecclesiastical architecture; there was a great gulf between the modern architect and the builders of our great cathedrals. "Apparent rari nantes in gurgite vasto"—Rickman striking out bravely at the head of them; Pugin, Butterfield, Scott and others doing their best to follow; but there had been a shipwreck after all; and the methods of church restorers for some time after the modern renaissance had marks of salvage from the wreck—if, indeed, such marks had altogether disappeared even now. It would not be suitable to attempt a solution of the difficulties the existence of which he had thought it right to indicate; in the interest of archæology, however, he would venture to insist

upon two principles—(1) that the rule of leaving alone whatever existed in ancient buildings should be followed as closely as the condition of things, in any given case, would allow; and (2) that care should be taken not to introduce new work so carefully and even slavishly copied from the old, as to lay a snare for the feet of future inquirers. For his own part, he believed—and he quoted Ely Cathedral in support of his opinion—that it was possible to introduce new work into juxtaposition with old, without, on the one hand, any sense of incongruity, or, on the other, any indication of weak and foolish copying. Perhaps, in archæological architecture, as in politics, a brave originality was not only consistent with, but was the wisest and safest outcome of, a true and wise conservatism. In closing he would say that from the archæological point of view they might rightly divide ancient buildings into two great classes—the dead and the living. Of the first class he would say—Leave them alone, or else they should be only so far meddled with as to prevent mischief, and to hand them down uninjured and unaltered to posterity. The second class, too, must be conserved, but it could not always be on the plan of letting them alone; and therefore the architects who should be called to deal with them should be, politics apart, profoundly conservative. They ought to be learned and skilful in order that they might see their way as to the best thing to be done. Further, they ought to be patient, good-tempered, long-suffering, because they were sure to be pelted with abuse whatever course they took. It was to be hoped that the backs of architects were suited to their burdens, and that men would always be found having the natural and acquired qualifications necessary to deal with ancient buildings wisely, cautiously, kindly.

Mr. J. T. Micklethwaite, in proposing a vote of thanks to the Bishop of Carlisle for his address, took occasion to say that, with respect to the question of dealing with Westminster Abbey, the Commissioners were absolutely unanimous on one point, namely, that of leaving the building alone as it had come down to us. One point about the buildings still in use might be put very shortly, and that was that in altering a building the restorers must alter it for their own use. The real mischief had been, not that the restorers had been trying to make the buildings more fit for use, but that they had been putting them back into some past condition which did not make them more useful than before.

Dr. Rowand Anderson, in seconding, said he was sure that the bishop's words would give the greatest encouragement to all who were engaged in restorative work, and would tend to soften much of the bitter criticism that was poured out on the heads of unfortunate architects. One view he would like to press was that the restoration of buildings as we now understood it was entirely a thing of the present day. He was sure that if a society for the protection of ancient buildings had existed in the old days it would have had a very rough time of it. Architects in those days did not preserve. He was afraid they destroyed a great deal. In dealing with buildings at the present the architect was bound, as far as possible, to continue their history, and not to make slavish imitations amounting almost to forgeries.

The Rev. Dr. Cox expressed the hope that the result of the drawn battle between the Commissioners in regard to Westminster Abbey would be that for many years the Abbey would be spared as it was. He emphasised the great danger that would result from a call upon the nation to vote any great amount of money towards the building of a new chapel. The result would be a sort of popular control which would ruin very much of the sacred halo that now attached to the building.

The Bishop of Carlisle acknowledged the vote of thanks.

SURREY ARCHÆOLOGICAL SOCIETY.

THE recent excursion of this Society was to Charlwood, Leigh and Reigate, and was attended by upwards of fifty members and their friends, including many ladies. Assembling at the railway station at Redhill at noon, the party proceeded in carriages to Charlwood, where Mr. J. L. André, F.S.A., read a paper in the church descriptive thereon. He said the church was not mentioned in Domesday Book, but there certainly was an ecclesiastical building existing when the account of the Taxation of Pope Nicholas IV. was compiled in 1291. The living before the Reformation was in the possession of Christ Church, Canterbury, after which it passed into the hands of various families, that of Trix being the present owners. It is a peculiar of the see of Canterbury. Many of the registers are in excellent penmanship, and they commence in the year 1591. Mr. André then described the edifice, especial attention being directed to the very beautiful screen, probably the gift of Richard Saunder, whose initials appear upon it, with the arms of his family and that of the Carews. Mr. André next pointed out the curious paintings still remaining on the south wall, and which were laid bare by the late rector, the Rev. Thomas Burningham, in 1858. These paintings formed the subject of a very interesting paper by the late Mr. William Burges, published in the *Archæological Journal*. In this paper Mr. Burges said, "Unfortunately only two bays are preserved, one on the east and another on the west of a two-light Early Decorated window. The eastern division contains three bands, the westernmost only two, thus carrying out the principle of increasing the decoration as it approached the east. The eastern bay is occupied with the history of St. Margaret; the arrangement of the subjects corresponding closely with the illuminations in a nearly contemporary MS. in the British Museum, commonly known as Queen Mary's Psalter." Mr. Burges then describes the story of St. Margaret. The western bay has only two bands, and it evidently contains the story of St. Nicholas, the patron of the church, and the Mediæval allegory of "the three living and the three dead." Mr. André next described the brass still existing on the south wall of the present chancel, and which is in memory of Nicholas Saunder and his wife, the date of the memorial being 1553; and a few words on the monuments of the Jeale, Jordan and Sharp families concluded the paper. Mr. Wilkins's house, near the church, was next visited and described by Mr. Ralph Nevill, F.S.A., who said that the building was a very interesting specimen of an old English house of the time of Queen Elizabeth, unusually complete in design and apparently all of one date. The old table, recently removed, had sinkings in it to receive the salt. Having explored the house, the company was next driven to Leigh, where, in the parish church, Mr. Mill Stephenson, F.S.A., hon. sec., in describing it, read some notes by Mr. F. C. Lees, who restored the church some time ago. The existing building dates from the fifteenth century, when the old church must have been almost entirely rebuilt. The stained-glass windows in the chancel contained some very fine modern glass, the gift of Mr. John Watney, F.S.A., a member of this Society. Leigh Place was next visited. This was a fine old house surrounded by a moat; inside it had an interesting old hall with an immense fireplace, while upstairs there is an antique mantelpiece bearing an inscription said to have been written by some prisoner or priest hidden there. During some alterations, with a view to modernising the house, a silver cup, 200 years old, containing coins, was found concealed in the plastering, and some swords and armour were taken out of the moat, supposed to be the result of skirmishes in the time of the Commonwealth. Mr. John Watney, F.S.A., here read notes on the history of Leigh Place and of its former owners.

The members and friends were next driven to Reigate, and arrived at the ancient castle and caves during a thunderstorm, and it was interesting to listen to the phenomenon of muffled thunderclaps and storms overhead while twenty or thirty feet below in the caves, which could be distinctly heard during the reading of a paper on the history of Reigate Castle by Mr. Mill Stephenson, in the absence of the author, Mr. Granville Leveson Gower. In his paper Mr. Gower said there were no remnants of the old castle now to be found. Generally speaking, when an ancient castle was demolished, the old castle well still remained to mark the site; but in the case of Reigate he (the author) had failed to find the well, and he would be glad if anyone could indicate to him its position. For the purpose of the visit the Mayor and Corporation of Reigate had admitted the members and friends to the caves free, and they were illuminated by the head gardener, Mr. A. J. Jeal, with upwards of forty lights.

The entire party next proceeded to Reigate Church, which the Rev. J. W. Pickance described, with its monuments.

At the White Hart Hotel, Reigate, the members and visitors sat down to a collation. Mr. John Watney, F.S.A., presided. Besides those whose names we have mentioned, there were also present the Rev. R. M. Blakiston, Rev. T. S. Cooper, Messrs. A. J. Style, S. W. Kershaw, M. Pope, C. H. F. Lewes, W. F. Potter, J. Bowyer, T. F. Peacock, W. P. Ivatts, &c., and many ladies. Replying to the toast of "Success to the Society," Mr. Mill Stephenson (hon. sec.) said the Society was continuing to flourish financially and in numbers, and he hoped to have a new volume of the "Transactions" of the Society in the hands of the members in the course of a week or so.

THE GREEK STAGE.

A PAPER on the "Vitruvian Account of the Greek Stage" was read by Mr. Louis Dyer, delegate from the Archæological Institute of America, at the meeting of the Archæological Institute in Edinburgh. The general drift of Mr. Dyer's argument was that the contradictory accounts of Vitruvius as to the component parts of the Greek theatre were not to be relied upon in view of modern research, and especially of the discovery of a very complete ancient theatre at Epidaurus. The Chairman, in inviting criticism of the paper, suggested that perhaps Vitruvius, like some modern young men, had too much Chian wine when he went to the theatre. If any one, he said, could give any explanation to save the character of Vitruvius

they should be glad to hear it. Dr. Evans instanced this as a case in which archæology had come in to aid history. It appeared to him that if they had facts at their command they were to be taken as interpreting, and, if necessary, controverting, what came down to them in the history of Vitruvius. He moved a vote of thanks to Mr. Dyer. Professor Clark, in seconding the motion, said that, in his view, Vitruvius had stated two absolutely contradictory sets of facts.

THE SOUTH KENSINGTON MUSEUM.

THE late Sir Prescott Hewett, F.R.S., the surgeon, having expressed a desire that part of the collection of water-colour drawings which he had formed should find a home in the galleries of the South Kensington Museum, to which he had been a constant visitor, his children, Miss Prescott Hewett and Mrs. Hallett, have now given effect to his wishes by offering a selection of fifty of the best and most representative works by various artists, several of whom are at present unrepresented in the historical collection at South Kensington, with one of Sir Prescott's own drawings, to the Lord President of the Council, by whom, as *ex officio* trustee, they have been accepted. The terms of the deed of gift are much the same as those under which the late Mr. Sheepshanks gave his celebrated gallery of pictures to found a National Gallery of British Art at South Kensington in connection with the Museum and School of Art.

THE SANITARY REGISTRATION OF DWELLINGS.*

THE purpose of this paper is to enforce the view that all dwellings hereafter to be built and certain classes of dwellings already erected should be provided—first, with a system of house drainage so arranged and constructed as to guard the inmates from the noxious influence of so-called sanitary appliances; secondly, with a protected indoor water supply as distinguished from a wholesome supply at the fountain head; and lastly, that the dwellings referred to, when so provided and on production of a sanitary certificate granted by competent authority, should be entered in some competent register.

It cannot be denied that the existing legislative provisions as to house drainage and water-supply protection are insufficient to maintain the degree of safety necessary for preserving health, and although other matters appertaining to house sanitation deserve consideration, the two subjects mentioned demand urgent attention, and ought to be dealt with more effectively by competent authority. While adequate ventilation of a house, inodorous surroundings and other matters are of considerable importance, many of them are largely dealt with by existing law. Further, there is this marked difference between some of these useful requirements and those specially pressed by this paper. Bad ventilation and ill-placed dustbins are obvious defects, the purchaser or hirer of a house cannot say that he is misled or deceived, and the maxim *caveat emptor* applies. But with regard to faulty arrangements in the domestic closets and waste pipes and defective and ill-contrived water-cisterns the case is different. The offending point may be discoverable only by the observing powers of an expert or may be concealed from every one until revealed by illness or the breaking up of a building. The mischief is insidious, and as the emanations from sewer connections are of serious consequence to inmates of dwellings it seems only reasonable to draw a distinction between the open and obvious defect and the insidious approach of a concealed danger, and to urge that to meet this danger Government action may be properly invoked.

It is no doubt true that existing law provides that water-closets or equivalent arrangements shall be supplied and that drainage shall be attended to, and it is also the case that under certain circumstances and after certain formalities, entrance of officials into occupied dwellings is authorised to ascertain that the necessary sanitary conveniences have been provided. But it does not appear that a faulty construction of such appliances can be dealt with unless the fault is glaring and the evil therefrom amounts almost to a nuisance to outsiders. In order, therefore, to enabling intending occupiers of new dwellings to be saved from injury it is essential not only that these should be provided with the usual appliances, but that they should be inspected and pronounced good in themselves and suitably adapted to those dwellings. For otherwise the mere requirement that domestic conveniences shall be provided almost amounts in many cases to a statutory obligation to undergo illness or suffer death.

In regard to the water supply, the point now urged is that water for drinking should be protected after its introduction to the house, for obviously, however good it may be at the fountain head, this is of little advantage if it become affected by pollution within the walls of the dwelling. Protection from this should be insisted upon both as regards possible contamination by emanations from discharge pipes and also as regards the position of the drinking-water cistern, so that it shall not be a receptacle for dust or inaccessible for purposes of investigation or periodical cleaning.

With regard to existing dwellings, however, the difficulty of rigorously enforcing such requirements is very great. To insist upon all such buildings being brought at once (even if it were practically possible) to the ideal standard of sanitation would, by reason of the heavy cost and the occasional disarrangement of the buildings, prove an unreasonable demand upon the resources of individuals. But it is conceived first that, without in such cases quite approaching the ideal standard, a minimum standard might be adopted which would still be of considerable sanitary value. Next that the lower standard might be enforced after the completion of a long tenancy or period of years.

As to water, however, whatever minimum of house sanitation experts might consider sufficient, I trust it would not be deemed too severe a demand if, as to protection of drinking water, there should be but one standard.

In regard to the use of the word "dwelling," the term is here intended to apply both to residential houses and to all buildings wherein human beings are employed or engaged for any number of consecutive hours. It is not forgotten that the present law, by the Factory and Workshop Acts, the Common Lodging Houses Acts, and others, deals with numerous special cases, and that already some overlapping occurs. But for the purpose of this paper there is much ground that those Acts do not cover, and when such statutes are in effective operation it is not proposed that they should be interfered with by further legislation. It has been stated that with existing dwellings a different standard of sanitation might be accepted and time given for its adoption. With regard, however, to certain classes of such dwellings, I would urge that legislation should at once intervene. I refer to the cases of hotels and lodgings and to Board Schools and other institutions under local control.

The reason for demanding the sanitation of such existing buildings is, that with hotels the public have not always the opportunity of choice. Arriving from the country or from abroad, the stranger in a town must go to such quarters as are available, and the very purpose of hotels is to provide accommodation for travellers who of necessity can know nothing of the arrangements of a dwelling within whose walls they may, under the greatest urgency, be bound for a time to reside. And when we know that, perhaps at home, and certainly abroad, the traveller's life has been cut short by insanitary conditions of hotels, it does not seem much more unreasonable to demand protection from such evils than to insist that for some hours daily there shall be no sale of alcohol.

Lodgings, though not quite in the position of hotels, are included therewith because where the business is a regular occupation the functions of the lodging-house are very similar and the position of the guest almost equally defenceless.

Board schools are placed in the same category, because attendance of the children is compulsory, and they neither know nor care about sanitary arrangements. As to the parents they are probably altogether excluded from an opportunity of inspecting those departments, and it is quite possible that even if it were granted and the condition of affairs were grossly unsatisfactory the parents would come to the conclusion that, in comparison with their own, the arrangements were salubrious and even attractive.

It may be urged that the compulsory action suggested is, in the case of public institutions, nnnecessary and vexatious. Without saying that my experience of such cases is extensive, I can state that instances of a very gross character have occurred. Where, in very large buildings under the control of a School Board, the sanitary arrangements had been pronounced faulty and dangerous to health, and several deaths had ensued therefrom, the Board nevertheless failed to take such action as was necessary, and the schools were after the holidays re-opened on the alleged ground that there had not been time or it was not then convenient to carry out the operations so imperatively required.

To an audience of this character it would be vain to attempt be reciting sensational cases to enlist their sympathies convincing their reason, but certainly it would not be difficult to illustrate the point at issue by other examples of grievous suffering and distress inflicted upon the young, the weak and the helpless.

We have now to inquire as to the sanitary registration of the buildings referred to. It is conceived that the best mode of enforcing the observance of sanitary regulations is to establish a public register in which to enter a reference to every building which has complied with such regulations, and to provide that

* A paper by Mr. Henry Rutherfurd, barrister-at-law, delegate from the Sanitary Assurance Association, read at the International Congress of Hygiene and Demography.

no buildings should be inhabited until so registered. The registration would be effected on production of a certificate of due sanitation from some competent authority. Then inasmuch as the sanitary condition of a house may vary with lapse of time, it is proposed that quinquennially an inspection should be made, and the fact, if all be found in order, endorsed on the certificate. But if any discovered evil should within a certain period not be remedied, the house would then at once disappear from the register. In the case of change of tenancy during the quinquennial period, or structural alterations endangering the sanitary arrangements, it should be obligatory on the house owner to obtain inspection and notify results to the sanitary registrar.

In this connection it would be well to consider whether encouragement should not be given to the voluntary sanitation of dwellings, for the time being excluded from compulsory regulations, by entering them in the register when duly certified, on such easy terms as to fees and otherwise as might be thought expedient. It is probable that many house proprietors would be willing and eager to conform to such modified regulations with the view of attracting tenants, or securing more remunerativo rents, the result in either case being to the benefit of society at large.

The question still remaining is that of the persons or parties competent to issue the sanitary certificates. Whilst admitting to the full that the educated official persons at present in charge of the public health are competent and desirable authorities to grant such certificates, it is considered that the power in question ought not to be confined to the officials of the State. Sanitary science is still young, and it may be that progress would be more surely made by extending the power to certify to such medical men, architects, engineers or associations as have themselves, or through their staff, recognised diplomas of sanitary knowledge. Just as under the Vaccination Acts, while the act of vaccination is often performed by official persons, the statute may be complied with through means of other persons, provided they are qualified by diplomas of recognised validity.

It is not denied that some difficulty may arise on this part of the subject, and the limits allowed will not permit of its being fully dealt with. But it may be suggested that the reckless or fraudulent issue of certificates could be met by severe penalties, while the offenders would still be left open to the public trial of a civil action for damages at the suit of any injured party.

Lastly, although the measures recommended in this paper may not be "heroic," it is submitted that they are worthy of consideration, and that their adoption would to no inconsiderable degree work for the general good. In asking for State interference, it must be remembered that we are making fresh invasion on private liberty, and we ought not to extend this invasion further than is absolutely necessary. Also, the theoretical sanitarian is bound to consider what are the prospects of passing ideal schemes into effective law. The insistence of a very high standard may lead to immediate failure and possibly to a disastrous postponement. On the other hand, there can be no doubt that if, by the limited scheme here presented, dwellings should be provided with appliances of the character specified, examined in their respective positions and periodically supervised, a great improvement would be conferred upon the habitations of the people, slow and lingering disease would be diminished, the tone of the general health would be raised, and something will have been done to increase the happiness of many an individual home.

SILCHESTER.

THE traveller who leaves the Great Western Railway at the little station of Mortimer, half-way between Reading and Basingstoke, and walks for some three miles south-westwards through pleasant Berkshire lanes will reach, says Mr. F. Haverfield, in a communication to the *Manchester Guardian*, just on the border of Hampshire, the solitary church and manor-house of Silchester. As he turns on his right hand through the farmyard of the manor, he finds himself in an open space of some two hundred acres, in shape an irregular heptagon, spread out on a hill which slopes gently to the south. Round it, in a circuit of a mile and a half, runs a grassy bank crowned with a hedge which shows half-hidden beneath it the ruins of an ancient city wall. The enclosure itself is a waving cornfield, broken here and there by hillocks of upturned earth or clearings made by excavators' spades. In the clearings are faint traces of buildings—low flint foundations of houses, tiling, pavement, with shattered fragments of pottery that meet the foot at every turn. Three modern huts preserve some of the ancient relics found by explorers at various times, worked or carved stone, the Doric capital of a column, bits of Purbeck marble with a few letters testifying to an inscription, and besides these, tiles and pottery of every sort, coins, iron and bone tools, and all the smaller furniture of Roman life. Close by workmen are busy in driving trenches, tracing foundations, sorting *débris*; and the inquirer will be told that the Society of Antiquaries, the leading archæological society of England, is promoting the continuance of the excavations begun by earlier workers.

Such is Silchester as a visitor might see it to-day, and if he be not a professed archæologist the sight may not a little amaze him. Why, he may ask, should the Society of Antiquaries trouble to collect money and tell off one of its most competent members to superintend the uncovering of this great cornfield? Pottery and coins, bricks and tiles, are common enough, and though some more precious finds are not to be seen on the spot, they include little beyond three or four inscriptions and a small bronze eagle, thought to have been once the ensign of a Roman regiment. History is silent about the town. What interest, then, attaches to this particular hillside, which has yielded so little that is rare, and on which hardly one stone is left upon another? The answer to the question is twofold. In the first place, the site is famous—the most famous, perhaps, of all the sites which were inhabited during the centuries of Roman dominion in Britain. This fame is not due to any special discoveries; it arises very largely from a tendency which characterised the work of English archæologists in the seventeenth and eighteenth centuries. These men did not trouble themselves very much with actual remains; they had, indeed, comparatively few remains of the Romans in Britain with which to trouble themselves. Instead, they followed Leland, earliest of English antiquarian writers, and devoted themselves to the study of roads. As starting-point they had a road-book of the Roman Empire, compiled perhaps in the third century, and known to specialists as the Itinerary of Antoninus, and they sought to fix the roads and halting-places catalogued in this work. They have not been very successful. Eager eyes have seen *viæ* and *stationes* in strange places, and the error has been increased by the ingenious Bertram, who compiled and published as antique an itinerary of Roman Britain which seems even yet to find credence in some minds. But where discretion failed enthusiasm abounded, and every spot where Roman roads are visible or the road-book can be applied has been the object of profound attention. Silchester is pre-eminently such a spot. Roman roads meet there—real Roman roads; the road-book mentions it under the name of Calleva, and it has the peculiar merit of ancient and extensive walls. What wonder, then, that it has become the El Dorado of our antiquaries, that excavations began there sixty years ago, and a German scholar of some note has actually crowned its fame by imagining it to have been an important fortress? What wonder, too, that the Society of Antiquaries should devote the first-fruits of their new Research Fund to this famous ground? But there is another and better reason for the excavations. If the great reputation of Silchester is based on bad reasons, the city has still, in all seriousness, real claims on our attention. The Romans built the existing walls, but they built inside a circle of earlier Celtic earthworks. We are on the site of a British town, perhaps a capital of some tribe in pre-Roman times, the town, perhaps, which coined the curious British gold pieces stamped with the superscription CALLEV. And though this Celtic town has vanished, save for faint traces of its earthworks, its site supplies us with evidence about the Celtic population under Roman rule. The exploration of Silchester resembles the exploration of Cranborne Chase, lately achieved by General Pitt-Rivers. There the minute examination of a poor pit village told us how the villagers lived in Dorsetshire under the Roman government. Here we shall learn the condition of the townsfolk as they were in a town of some size which yet was neither a privileged "colony" like Colchester nor a great garrison like Chester.

As yet the excavations are incomplete, but something may be ventured, though it is as much prophecy as knowledge. The town, which is being slowly uncovered for us, possessed a forum, or what did duty for a forum, with a set of buildings round it, covering in all two acres. Chief of the buildings was a hall of some sort, called by archæologists a basilica—a large edifice, to judge by its ground plan, for it was some 270 feet long. This was the centre of the town, and private houses, temples and baths lay around. The streets ran, it would seem, at right angles. Silchester must have resembled Mannheim, where you can stand at any corner and see the city's limits in four directions. Two temples have been found near the eastern gate, testifying to former glory by Purbeck marble wall linings and vestiges of colouring. A third temple lay south of the forum, and beyond it were perhaps the baths. The private houses, so far as they have been unearthed, are of moderate pretensions. They had mosaics and heating apparatus, but the mosaics are somewhat plain, and the rooms somewhat small. They were not in continuous rows; each stood, it may be, in its own garden, and if the results yet reached are typical of the results to come, Silchester must have resembled a Withington rather than an Ancoats. A considerable portion of the place, at any rate, was not thickly populated. The foundations of the houses are often of flint, and the superstructure was often perhaps of wood, while upper storeys were rare. Except from these things, it is hard to get evidence about the wealth of

the inhabitants. The smaller objects lately found are not uninteresting—there is a remarkable series of carpenter's tools, rescued from a shallow rubbish pit—but they do not reveal secrets. Were it not for the basilica and forum we should rate the civilisation of the place comparatively low. It may be that further search will reveal further wealth. The work is being done with great care and under most efficient control, and may fairly count as an undertaking of the first importance to archæologists.

ENGLISH ISOLATION HOSPITALS.

A PAPER was read by Dr. Thorne Thorne at the Congress of Hygiene, in which he offered some suggestions respecting isolation hospitals. An unoccupied zone of 40 feet, he said, should surround the hospital buildings; each disease should be treated in a building aerially distinct from any other; the wards should have means of cross-ventilation; and in allotting a space of some 2,000 cubic feet per bed, care should be taken to give at least 12 feet of wall-space to each bed, for it was on a level with the patient's lungs and mouth that it was so essential to secure wholesomeness of air breathed. As a rule, one bed per 1,000 of the population sufficed for the current permanent requirements, and no district should be content unless a few cases of two different diseases in both sexes could be simultaneously isolated. Much depended for success on the character of the hospitals. Unless they are reasonably attractive in style, and well designed for purposes of recovery, that immediate isolation which is above all things necessary is not attained. It is not the poor man who, when suffering from infectious disease, constitutes the greatest danger to the community. It is such as the milk-vendor's, the draper's, the publican's family, namely, those who, through their wares and otherwise, tend to scatter infection, that are above all a public danger; and they must be attracted by a building where there is reasonable comfort and the best chances of recovery.

SCHOOL BUILDINGS.

Ruthin.—New grammar schools have just been opened at Ruthin by Sir Wm. Hart Dyke. The cost of the work has been about 7,000*l.* Messrs. Douglas & Fordham were the architects, and Mr. Tom Browne, of Chester, builder, carried out the works, Mr. H. A. Davis being clerk of works.

Rowley Regis.—New schools erected by the Rowley Regis School Board at Macefields, Old Hill, have just been opened. The total cost of the buildings, exclusive of the site, is 3,500*l.*, and accommodation is provided for 460 children, but the buildings are so constructed as to be capable of future extension to make provision for an additional 140 children. The schools are built upon the principle of grouping all the classrooms round the central porch, so as to give every classroom a side-light to the desks. They are built of red bricks and terra-cotta, with Broseley tiles on the roofs. All the floors are laid with solid oak blocks, excepting the porches, which are of asphalte. The school is for boys only. Mr. W. Willetts, contractor, of Old Hill, is the builder, and Mr. J. T. Meridith, of Kidderminster, the architect.

CHURCH BUILDING AND RESTORATION.

Doncaster.—The church at Marr, near Doncaster, has been reopened after being closed for some months for restoration. The work has been carried out under the direction of Mr. C. H. Fowler, architect, of Durham, and the cost (about 800*l.*) has been defrayed by Mr. P. Thelluson, of Brodsworth Hall. Among the works a new open-timbered roof has been placed over the nave, and a waggon-head timbered roof over the chancel.

Edinburgh.—The foundation-stone in connection with extensive alterations to St. Mary's Roman Catholic Cathedral has just been laid. The side chapel recently destroyed by fire, together with the vestry behind it, are to be formed into a commodious aisle and new vestry, and a corresponding aisle will be constructed on the other or northern side of the nave. The present side walls of the main building are being removed, and their places taken by massive Gothic pillars, with Gothic arches intervening for the support of the roof. The work in all will cost 9,000*l.* The plans have been prepared by Mr. John Biggar, architect, 8 Dryden Street.

Heswall.—The new Wesleyan centenary chapel at Heswall, Cheshire, has just been formally opened. The building provides accommodation for over 325 adults, and consists of nave, transepts and chancel, with minister's vestry and other conveniences at the rear. The style adopted is Perpendicular Gothic, and the buildings are faced externally with local red sandstone, rock-faced in narrow courses, the windows and dressings having tooled faces. The heads of all windows are filled with handsome tracery, and the glazing throughout is of tinted cathedral lead-lights of artistic design. An octagon bell-turret has been designed at the right of main gable, from which it is corbelled out and carried upon red granite shafts. The internal woodwork is of pitch pine varnished, the external work being of red pine, painted four coats. The roofs are slated with the best slates, in alternate red and blue bonds. The total cost of the buildings, exclusive of seating, which has been transferred from the old chapel, is within 1,400*l.*, including heating and water supply. The contract has been successfully carried out by Mr. John Shaw, from the designs and under the superintendence of Mr. Thomas W. Cubbon, architect, of Birkenhead.

Smethwick.—St. Paul's Church, West Smethwick, has been reopened after alterations and repairs. The repairs and extensions have been carried out by Messrs. J. Harley & Sons, Smethwick, from designs by Mr. T. H. Fleming, diocesan architect. A new organ for the church is also being built. The total cost of the improvements is about 1,326*l.*

GENERAL.

Lord Jersey presided at the inaugural meeting of the Incorporated Institute of Surveyors of New South Wales.

Mr. W. Richmond, A.R.A., is designing cartoons for mosaics for the decoration of the choir of St. Paul's Cathedral.

The Order *Pour le Mérite* has been conferred on Professor Hildebrand, the sculptor, of Florence.

A New Oak Lectern for St. Paul's Church, Devonport, has been executed by Messrs. Rashleigh, Pinwill & Co., of Plymouth, from the design of Mr. Edmund Sedding.

A Reredos designed by Mr. J. L. Pearson, R.A., has been placed in the church of St. Mary, Aylesbury.

An Appeal is being made for funds for the restoration of the ancient church of St. Lawrence, West Challow.

The Mansion of Mr. Robert Barclay, principal partner in the well-known brewery firm, at Bury Hill, Dorking, has been seriously damaged by fire. The damage is estimated at about 1,000*l.*

Earl Brownlow has given a plot for a new church at Kitsbury, a rising suburb at the west end of Great Berkhamstead.

The Electricity for the forthcoming Electrical Exhibition at Frankfort is to be generated by the river Neckar from a point 70 miles away.

The Salford Town Council on Wednesday adopted plans prepared by Mr. Henry Lord for the erection of a technical school, near Peel Park, the cost of which, including the fittings, is roughly estimated at 40,000*l.*

Professor Pistor, of Berlin, who has been attending the Hygienic Congress, has visited Manchester with a view to making inquiries respecting the sanitary arrangements of the city.

The Works for placing the fifth of the series of mosaics for the spandrels of the dome of St. Paul's Cathedral are now in progress.

The Bury Markets Competition has resulted as follows:—1st premium, Mr. Archibald Neill, of Leeds; 2nd premium, Messrs. Lewis Hornblower & Sons, of Liverpool; 3rd premium, Mr. H. B. Buckley, of Leeds. The designs of Mr. Robert F. Matthews, of Birmingham, were also commended.

Mr. B. Wall, of Newport, was awarded a gold medal and first prize for wood-carving in oak at the Welsh Eisteddfod, and a cheque for ten guineas and a silver medal for the best carved oak Bardic chair were secured by Mr. W. T. Morgan (Swansea). The prize for hammered ornamental ironwork was withheld.

In an Action to interdict the Bellsdyke Coal Company from working minerals under and around the Airdrie Academy so as to endanger the stability of the structure, the interim interdict has been continued till September 8 to admit of defences being lodged by the defendants.

At the Meeting of the Wetheral Burial Board a letter was read from Mr. Johnson, the Board's surveyor, offering his services as architect and surveyor in the carrying out of the cemetery at Ashgate, preparing all plans, sections, specifications, levelling, &c., for 49*l.* 16*s.* 4*d.*, the advertising for all tenders for the work to be done by the Board. The offer was accepted.

The Contract was obtained in May last by Mr. James O'Driscoll, of Glin, co. Limerick, from the Nenagh Guardians, for the carrying out of waterworks for the town, at a cost of between 5,000*l.* and 6,000*l.* Having since found out that in the diversion of the river which is to form the source of the water supply that he has estimated 666 yards as 666 feet—a mistake by which he would lose 700*l.*—he has declined to perfect the bonds. The Guardians find they cannot keep the contractor to his contract, as he has not his sureties, though otherwise the bond has been perfected. Fresh tenders are to be advertised for.

The Architect.

THE WEEK.

On Wednesday there was a meeting of the General Committee of the British Association, when Professor Huggins announced that the tickets which had been taken for the Cardiff meeting numbered 1,488. A resolution was reported from the Geographical Section in favour of the immediate publication of the 1-inch and 6-inch Ordnance Survey maps, also of bringing the maps up to date and making them more accessible to the public and supplying them at lower prices. A letter was read from Sir Archibald Geikie, acknowledging the honour which the Association had conferred upon him by electing him as its president for the Edinburgh meeting, which is to be held in August next. The meeting of 1893 will be at Nottingham. Money grants amounting to a total of 1,013*l.* 15*s.* 6*d.* were then made to the various committees of different sections for carrying on the scientific investigations entrusted to them.

The autumn exhibition of the Birmingham Royal Society of Artists will be opened on Friday next. Among the works which will be seen are the *Bath of Psyche*, by Sir F. Leighton, P.R.A.; Mr. Orchardson's portrait of himself; the portrait of Mrs. Chamberlain, by Sir J. E. Millais; *Love and Life*, by Mr. Watts; *Sposa de Libano*, by Mr. Burne-Jones; portraits of Dr. Hans Richter and M. Paderewski, by Mr. Alma-Tadema; *The Hills of Morwen*, by Mr. Colin Hunter; *Anne Ascough Preaching*, by Professor W. Geets; Mr. C. R. Kennedy's *Perseus and Andromeda*. There will be an excellent collection of water-colours, and it may be said that many of the best pictures seen in London exhibitions during the summer have found their way to Birmingham.

At the meeting of the Edinburgh Town Council on Tuesday it was decided that inscriptions should be placed on any public monuments where they were needed to explain the subjects. Edinburgh has so many visitors it is desirable to have information of the kind. One of the councillors at the same meeting called attention to misleading inscriptions which were set up in the city. There is a notable case in St. Leonard's Lane, where a tenement has been erected on which an inscription has been carved on stone for all time to come, announcing that it was the site of Jeanie Deans's tryst. Readers of the "Heart of Midlothian" are aware that the place of tryst was at Mushets Cairn. A Town Council cannot do much to prevent such records. They are not unknown in London, where simple visitors are affected by them.

The competitors for the Prix de Rome have a chance of other prizes besides the coveted one. The three successful students have an equal share in the Prix Leprince, amounting to 2,425 frs., which this year has been divided among M. Levalley (painting), M. Sicard (sculpture), and M. Eustache (architecture). The last also obtained the Prix Delannoy, amounting to 1,000 frs. The Prix Cambacères, of 2,000 frs., has been divided between M. Déchenaud, painter, and M. Lefebvre, sculptor, who obtained second places in the contest. M. Normand, who was assigned the second grand prix in architecture, is more fortunate, as there are two consolation prizes available in his section, viz. the Prix Pigny, of 2,000 frs., and the Prix Lusson, of 500 frs.

Among the papers read at the meeting of the British Association this week was one by Mr. E. Seward, architect, on "The Formation of a Record of Prehistoric Remains in Glamorganshire." He said that district contained many of the earliest evidences of the handiwork of man. They had ceased to wonder at towns and villages springing up on bare heaths and mountain sides, and a record of the old order of things might prove of interest. The usefulness of such a record must be acknowledged. Looking inland a little from the rocky cliffs of the coast, on the ridges and table-lands which now had busy works beneath them, they saw rounded tumuli and traces of camps and menhirs and circles, which told them of man and his doings ages beyond the time when they were even sure of the name by which he was to be known. Elsewhere the pit hollowed into the shelving hillside, the blackened timber still to be traced beneath the quiet waters of the lakes, the monolith, the cromlech, the stone circle, each had its page for the book of a yet scarce-written history. Then a clearer type filled the pages. The Romans came, built encampments, made roads, and raised places of residence. Here they were on the borderland of history, but of the many years which followed the decay of the Romans there was little left but legend and story. They must, however, look for more material evidences in connection with those days than mere legends. They did not look in vain, for evidences of a Christian symbolism were found in the crosses, altar stones, tombs and monoliths, inscriptions and interlacing ornaments. They were, doubtless, remnants of a great array which proceeded from those centuries of early Christianity in Glamorganshire. Most of the known remains had been photographed and the work of forming a systematic record had been begun, the work having been suggested at a meeting of the Cardiff Naturalists' Society in 1885. Mr. Seward concluded his paper by referring to the various ways in which the record could be kept up and extended, and expressed the belief that it would be of great interest when completed. The President and several other members spoke in complimentary terms of the paper, and various suggestions were made for marking on maps the positions of caves, camps, tumuli, dolmens, barrows, &c.

Until a few weeks ago the Eleanor Cross at Waltham Cross stood near the corner of the street that branches out at right angles in the direction of the Waltham Abbey Road from the main street. The Cross now has a central position in the street, the Falcon Hotel having been taken down and set back in order to double the width of the street. This work is due to the generosity of Sir Henry Meux, Bart., who also, it will be remembered, did a good work in rescuing the masonry of Temple Bar from the Farringdon waste. This structure was re-erected in Theobald's Park, and is distant about a mile or two from the Cross. People who have been accustomed to see Temple Bar hemmed in amid Fleet Street can hardly realise the grandiose appearance it presents as seen in its present country home, with fine trees as a contrast. About four miles from the town of Waltham Cross is that of Waltham Abbey. The portion of the abbey still remaining was restored by the late William Burges, who was reverential in his treatment of the ancient work.

The Plasterers' Company have offered 25*l.* for prizes, which will be awarded after an examination which is to be undertaken by the City and Guilds of London Institute in May 1892. The subjects of the examination will relate to limes, sand, hair, stucco, plaster of Paris, lathing, cements, tools, plastering, sgraffito, modelling, &c. Each candidate for the honours grade will have to submit a specimen of his work in sgraffito, modelled stucco or piece moulding. It is well to see the Plasterers' Company showing a little interest in the education of workmen, but something else besides a donation of 25*l.* should be offered. Why is not the old system revived, and the freedom of the company offered to plasterers who are able to show that they are worthy to become members of a trade guild?

M. Ringel d'Ilzbach has gained celebrity in Paris by his portrait-medallions, but he has proved his competence to treat sculpture of another kind. The Duchess de Pomar was therefore well advised to select him to produce a statue of Mary Queen of Scots, which was to be presented to the city of Paris. It was shown this year in the exhibition in the Champ de Mars. The Duchess was eager to have the work set up in the Place Wagram, but owing to the traffic municipal authorities considered that site to be unsuitable. It is now said that the statue will be offered to Edinburgh. According to another version, the Duchess was desirous that the statue should bear some resemblance to herself, and the difficulty thus arose. In any case, it is to be hoped M. Ringel d'Ilzbach will not suffer loss. A statue of the kind is more costly than the majority of amateurs can realise.

ENGLISH RENAISSANCE.*

THE second instalment of the splendid work on the English buildings of the Renaissance period is equal in quality and interest to the first. There is, moreover, an additional quantity of descriptive letterpress and diagrams, and the costly plates have been increased to twenty-two. Subscribers will, therefore, obtain more than was agreed for, and so much liberality suggests the spirit which has inspired the arrangements for the work. It may be said without any exaggeration that no German or French publisher could produce a more satisfactory volume or more faithful representations of the buildings, and, remembering the indifference of the profession in England to all but the cheapest class of books, the appearance of such a work is a marvel. Foreign publishers can always rely on a liberal recognition of their enterprise by architects; there are publishers in Paris and Berlin who will rarely bring out a book on an architectural subject unless the price is to be equal at least to twenty shillings of English money, and it is common to find works for which the price is from five to ten pounds. However costly the books may be there is a market for them. Architects invest in them not merely for the use that can be made of the plates as patterns, but for the delight which is afforded by the subjects. Being proud of their profession they are willing to make sacrifices to possess volumes which are a tribute to its greatness. We should not be surprised to hear that Mr. Gotch's book was more sought after in Germany than in England. But the German architect moves in the midst of people that are cultured, and it would be dangerous for him if he could not at any time be able to explain the ramifications of the Renaissance. The knowledge which he is expected to possess is not to be obtained in shilling volumes that he is able to borrow whenever he finds it necessary to persuade people that he is well read. In France there is no less liberality in expending money on professional books, but they must always bear the name of a Paris firm on the title-page. The English publisher may also fortunately depend on American support. At all events, we trust the "Architecture of the Renaissance in England" will gain the success it merits, and if many countries unite for that purpose so much the better. The subjects can have interest for others besides Englishmen.

If the general forms and details were copied from Italian or other work in the sixteenth and seventeenth centuries with the fidelity that is common in our time, the Renaissance buildings which are shown in the plates might be better, but the work would lose much of its character. The men who produced the details were like translators—it may be "traditori traduttori"—but their interpretations reveal much of their character, and correspond with similar efforts in other ways. In much of the architectural work of the period it is impossible not to be struck with the difference which is to be found between the design, as we can imagine it, and its realisation. From what we see we can infer what was intended. Take, for instance, the "Drawing-room, Bradfield," of which a plate is given by Mr. Gotch. There are several columns of novel forms, but it is evident the carvers were not equal to the delicate ornament. Over them are sunk panels, with sculpture in relief, divided by miniature columns which serve to support canopies for figures, and above is a sort of arcade with figures under the arches. But the figures, however important may be the subjects, are not much better than grotesques. The arches recall Saxon rather than Italian treatment. We must conclude that the Devonshire carvers were not able to realise all the beauty of the design supplied to them. As it is the effect of the room is said to be very fine, but if the work had been executed more worthily the room would be still more attractive. Mr. Gotch describes some of the ornament in the districts about Bradfield, which is ingenious enough; but we cannot believe that the designer of the drawing-room was a man who was only a combiner of scraps.

The Town Hall at Exeter has suffered much from time and the indifference of the lymphatic citizens. The designer was no copyist. If it can be granted that a few columns were adequate to the support of the superstructure, the treatment is logical enough. The columns cannot be called Tuscan; the plain sturdy shafts rest on massive bases, and each has a broad capital, from which the arch springs without the intervention of an architrave. The square windows of the council-room are separated by coupled Corinthian columns, and the pedestals are corbelled down to the caps below—in fact, the designer seemed to be as eager to suggest that all the forms were bound together in a scientific way as to obtain projections to give shadows. When undefaced the small building must have pleased the eye of many a stranger.

The house in the Butter Market, Dartmouth, is a well-known example of timberwork. In this case also the details are not equal to the importance of the design, and the corbels look as if they were produced by a carver of ships' figure-heads. The door from a dining-room in a "House in the South-west of England" bears some resemblance to the style of the Bradfield room, but the gracefulness of the curves reveals that the carving was not by the same hands. It is so beautiful an example as to raise doubts about some of the surmounting figures, which look like later additions that were removed for the purpose from a monument.

According to Mr. Gotch, "no house is more thoroughly English than Montacute," of which he gives three exterior views with a sheet of details. For effect it depends on the architectural lines. There are some helmeted figures between the windows in the upper storey which look more uncomfortable than those of Heidelberg, and a coat-of-arms, but no other carver's work. It is also true that "there is hardly any moulded work beyond that on the balustrade, the cornices and the windows," and if that work has a fault it is in an excess of delicacy. The designer may have been timid or did not make adequate allowance for the largeness of the building. When used for the small garden-house the moulded work appears far more effective. The detached columns at the angles appear to be of use as well as ornamental. The columnar form of the chimneys is also a defect which is not confined to the roofs of Montacute. The interior contains a gallery of about 170 feet in length by 20 feet 6 inches, but many changes have been made in the arrangement of the rooms since 1601.

Lower Walterstone, in Dorsetshire, which dates from 1586, was much damaged by fire in 1864, but the parts which Mr. Gotch has had photographed are those which suffered the least. The house might easily be supposed to be erected in the same way as early Christian churches; that is to say, by the despoiling of other structures. Mr. Gotch says "the detail is refined, and in places piquant, but the whole composition is a curious medley, some of the columns being quite out of proportion to the others, and the whole of them applied in the most barefaced way, merely as ornaments, while cornices and friezes are remorselessly cut through, and left to find support as best they can." The house is one of those buildings which could be taken as evidence of the theory that the forms commonly considered as essentially architectural are extraneous to the construction, and might be removed without much loss. In the garden front the whole of the columns, cornices and arches appear to have been stuck on after the true construction was completed. A doorway, no doubt, has been filled up, and therefore so much expense on ornamental work appears waste; but even with an open entrance the assemblage of Classic forms could only have suggested ostentatious display. Parts of the house are satisfactory, and we might suppose that the works began well, but the architect who devised them could have had no part in their completion.

Longford Castle, in Wiltshire, which is shown on one plate, was among the experimental attempts of the Renaissance builders, as it is on a triangular plan, the angles being emphasised by round towers. There is an elevation of the building by John Thorpe, but the triangular plan he gives does not correspond. The house has had many owners, and it "has been so materially altered from its original state as to have undergone practically a rebuilding, in which process, however, the old materials were reused." The triangular arrangement has survived, and two of the three towers are original. The inner court has been roofed, and converted into a saloon. The entrance front is admirably treated, the only drawback being the four-centred arches of the lower arcade. In Thorpe's drawing the arches are round, with masks in the spandrels.

* *Architecture of the Renaissance in England.* By J. Alfred Gotch, assisted by W. Talbot Brown. Part II. London: B. T. Batsford.

Burford Priory is now in ruin, although seventy years ago it was occupied. There is a chapel as well as a house, and much of the work was erected about the middle of the seventeenth century, at the cost of Speaker Lenthal. The peculiarities of the place are thus described by Mr. Gotch :—

> The work generally exhibits a curious survival of Jacobean influence. The windows of the house are Jacobean with a difference, the short lights at the top being particularly effective. The porch, with its columns, its pinnacles and carved gable, is Jacobean too, but the figures supporting the upper columns and the termination of the gable are indications of a later date. The chimneypiece in the drawing-room also retains much early feeling, though the change to the later style is apparent, while the ceiling in the same room might have been worked in the first years of the century. It will be observed that the moulded strings, &c., are of an unusual section, while the windows of the chapel exhibit a remarkable combination of quasi-Gothic tracery, with fully-developed Classic architrave and cornice. The wheel window might at first sight be taken to be Gothic, but a close examination shows it to be part and parcel of its Classic surroundings. The east and west windows are genuine attempts to give to traceried windows a Classic appearance, or at any rate an appearance other than Gothic. It will be noticed that some care has been taken to divide the head of the east window into five, the wheel window into ten, and all the rosettes that adorn them into five.

The monument of Sir Laurence Tanfelde in Burford Church is a curious medley of Classic forms, and it is impossible to understand the perversity by which heads were stuck against Corinthian capitals to form corbels and the allegorical figures were placed on an odd sort of pots. Another curious tomb shown in the second part is the "Griffin Monument" in Braybrook Church. This is one of the works which seem to have been executed by clumsy fingers from a good design, with additions that were out of keeping with the original intention. The architectural part might be supposed to have been arranged to suit unskilled workmen, but there could be little compromise with the heraldic forms, and in consequence they are ridiculous. With all the defects the tomb must have impressed people with the greatness of the member of the Griffin family to whose memory it was erected; it has, however, failed to preserve even his name.

At a time when heraldry was supposed to impart a sort of greatness to an individual or a family, it is remarkable to find one owner who failed to utilise the shields which his builder provided for him. When Sir Thomas Pope erected the house known as Wroxton Abbey in Oxfordshire, no less than eight shields were introduced as part of the decoration of the entrance porch, but the fields are still empty. The porch is interesting, and the oak doorway is so elaborate as to seem like an importation from Germany or Holland.

If at Burford seventeenth-century builders utilised Jacobean as if it were the style of the time, at Bolsover vaulting is to be found which, although of the seventeenth century, would be worthy of a Mediæval builder. As presented by Mr. Gotch's plates, Bolsover Castle appears to be full of detail that surprises by its freshness, and the execution is not unworthy of the design. The chimneypieces are, for "number, variety and beauty, without parallel in any house of the period. They were clearly designed for their respective positions. Much care has been bestowed upon their arrangement, and they are generally set within a projecting framework of stone, against which the wooden panelling stops instead of cutting into the various projecting members." We hope Mr. Gotch will be able to give some more views of the interior, for the Bolsover plates seem to be exceptionally interesting, as the designer exercised his invention instead of copying. He mastered the principles of the style, and his innovations are generally to be commended. In no other of the views is there so clear a recognition of the purposes which straight and curved lines can serve, and how the appearance of firmness is secured by the former. Even in the volutes of the capitals there is some rigidity. According to a historian of the building the architect was Huntingdon Smith, who lived at Bolsover in 1601, but Mr. Gotch doubts "whether the same architect did actually design the various buildings at Bolsover Castle."

Barlborough Hall, Derbyshire, dates from 1583–84, and Mr. Gotch believes that as the plan is of the same type as Bolsover it may have influenced the disposition of that structure. Many changes have had to be made in the house, but the exterior is a characteristic example of a dignified but quiet English mansion.

From what we have said it will, we trust, be evident that Mr. Gotch has selected a series that is interesting, and that each part is varied. His work will be valuable for architects and for amateurs who have regard for truthfulness; it will be found far more interesting than Nash's work.

THE SOCIETY OF ARCHITECTS' EXCURSION TO BELGIUM.

(*Continued from page* 108.)

EACH Belgian town appears to have a characteristic of its own. At Bruges was found cut brickwork and at Ghent rich Flamboyant tracery, but at Antwerp on Wednesday was found much greater delicacy of detail than in either of the other towns, and this not in one style or at one period only, but in Gothic, Renaissance and Modern work alike. In the modern Bourse it was first seen, by those who visited it in the early morning, in the carving and in the tracery which adorns the double row of columns supporting the gallery and those carrying the light iron roof above. Equally it was evident in the Hôtel de Ville, where in room after room most graceful and delicate Renaissance carving was to be seen, both old and new, it being often difficult to distinguish one from the other, the spirit of the older work had been so well caught by the modern workman. The low screen in the council-chamber certainly has a crisp character of its own, for it is finish and not crispness which is mostly found at Antwerp, as in the cut-brass panels to the doors in the conscript-room, the newly-added frieze to the dado in the mayor's parlour and reception-room, and the other modern dados, to say nothing of the modern paintings by Baron Leys and the still more recent ones by Lagye in the marriage-room. In the Musée Plantin, again, it is found in evidence in a curious pump of iron, and in the carved woodwork of cabinets and dados, and of a quaint external staircase, all much resembling the early Renaissance work of our own country. Yet again, and prominently, it is visible in the cathedral, over which the members were conducted by M. François Baeckelmans, now engaged as architect in its restoration, for the refinement of the lantern-spire is well known; but nothing in the church can equal the new carved reredos to one of the chapels in this respect, in which oak is treated with a delicacy of which even the most experienced of the party scarcely thought it to be capable, while still with truth and firmness. Probably this will be the prominent characteristic of the new organ-loft, but unfortunate indeed is its position, blocking up the handsome western window, and its iron construction, entirely out of harmony with the surroundings, and to be cased, on account of its unsightliness, in panelled oak—an indifferent substitute for the solid stone construction which would seem naturally to suggest itself. After leaving the cathedral the members scattered, some visiting the older parts of the town and sketching quaint bits, while others wandered into the various picture galleries, spending the few remaining hours there.

As each of the towns previously visited has its characteristic, so has Mechlin or Malines, reached on Thursday, for here towers and tourelles stand pre-eminent, with the great tower of the cathedral as their undisputed chief. Bold and massive, well designed, it rises from the square, and takes away the thoughts from the beautiful surroundings which lead up to it and add to the effect—the chevet, the old houses around, the museum with its one tourelle, and the Halle aux Draps with two. Canon Von Caster received the members at the cathedral and acted as their guide all day, pointing out many a curious detail which would else have escaped their observation, and leading them not only over this, the chief edifice, but everywhere throughout the town where there was anything to see—into his own private house, to view his grandfather's design for the completion of the cathedral tower; to the bridge whence the Convent des Carolites, with its tourelle, could be inspected; to the Palais de Busleyden, with another similar tourelle; and then in rapid succession to the restored palace of Margaret of Austria, to the Place and museum again to see many an old house, some in timber, some in stone, including the

Salen Inn, the earliest Renaissance work in Belgium, to the old town gate, with yet two more tourelles, and to the church of Notre Dame to see RUBENS's picture of *The Draught of Fishes*, a work well known to everyone, though engravings can give no idea of the rich colouring and masterful composition of the original.

If Brussels, to which town Saturday was devoted, has an architectural characteristic, it is that of stucco, for it is essentially a modern town, and the modern work, save in rare instances, is not of a high order. The Hôtel de Ville, which everybody knows, and in which the members were received by four of the chief officials of the city, contains some little good old work, and much of excellence, the work of the city architect, M. JAMAR; but the King's Palace, to which access was accorded by His Majesty's express commands, grand as it is both in proportion and design, is largely stucco. It is the furniture there which is of greatest beauty, after the reposeful lines of the staircase, ball-room and banqueting-rooms have made their presence felt in leaving the mind leisure to attend to detail, for the coverings were removed, and many a chair and table of delightful harmony and richness was disclosed, to say nothing of the wonderful collection of Dresden china, though surely the exceedingly thin porcelain petals of the flowers upon the one leg of a china table would never withstand a day of actual use, though eminently beautiful. Stucco again was the prominent feature of the new Palace at Laeken, now in course of erection to replace that burnt down some few years ago; for the King's commands had allowed of a visit to the works. It was a real treat, too, to wander through the great conservatories, and one idea, at least, of value was taken away, in the artistic treatment of their wrought ironwork.

Mons, visited on Monday by the reduced party of twenty-three which continued the tour for the second week, has its characteristic, and that characteristic is its meanness. Certainly the general opinion was that, save for the cathedral and, perhaps, the bold fifteenth-century façade of the Hôtel de Ville, the town was not worth a visit. Yet few would have cared to have missed the former, built, as it is, entirely in one style—Flamboyant—of which it is an excellent example. The exterior, for want of its tower, which has scarcely been commenced, is not particularly striking, save for its harmony and the easy grace of the window tracery; but the internal effect is imposing by its loftiness the grand massing of the parts, and the play of light and shadow. The treatment is bold and yet helped by the many chapels, which occur not only round the apse but along the whole length of both aisles. The roof is vaulted in brick, and there are no caps to the piers, so that the vault ribs are carried right down to the pier bases. Some beautiful alabaster sculpture is to be seen in panels scattered about the church, all of which at one time belonged to the sixteenth-century Renaissance choir-screen, removed some eighty years ago, while a small thirteenth-century reliquary is exquisitely wrought in gold filigree and inlaid silver, and an illuminated Book of Hours is remarkable for its finish and its wonderful state of preservation.

Tournai, though it possesses several buildings of interest, has one crowning feature of such a majestic character as almost entirely to draw attention from the rest—the cathedral, over which Canon HUGUET, in the absence of the Bishop, officiated as guide, and a capital guide he proved. He first showed the members the valuable collection of reliquaries, vestments and illuminated MSS. belonging to the cathedral, many of great beauty and interest, and then conducted them over the noble building. The nave, he explained, was begun in 1070, and is a perfect example of the work of the period, with richly-carved capitals, such as we should find in our later Norman, beautifully sharp, being wrought in the hard greystone found in almost all the Belgian churches, but particularly here, close to the quarries. Then the Transitional transepts with their apsidal ends are most exceptional and beautiful features, in keeping both with nave and the elegant, simple and lofty choir of the thirteenth century—which, by the way, showed signs of failure fifty years after erection, and was strengthened by thickening the main piers upon the aisle side, this being most cleverly accomplished, and the vaulting being remodelled in consequence. The retro-choir, with its projecting bays between the buttresses, is of this period, and French in feeling. The church of St. Jacques is noticeable not only for the beauty of its thirteenth-century interior, but from the triforium gallery being external to the clerestory windows; and the church of the Magdalene is of simple character of the same date, its feature being the carrying of the hood-mould to the three-light window in the square east end right across interiorly. The ancient town bridge across the river, with its existing portcullis grooves to block it against invaders, is curious, and the belfry and a house in the Rue de Paris are worth sketching.

GOVERNMENT OFFICES IN LONDON.*

THE whole business of the Government offices has been a kind of *decrescendo* from the great idea propounded by Barry. The Government did at one time so far entertain the idea of the Great George Street site for Government offices that they purchased some property in the street as a commencement—just enough to be of no practical use unless the scheme were carried further, as it is needless to say it never has been. In 1856, however, the Government made up their minds to combine the Foreign, Home and Colonial Offices, the India Office and the Local Government Offices on the central portion of the site originally proposed by Barry; and a competition took place for this, in which the designs of Scott were ultimately selected. Here again, however, we had an instance of the same ill-judged State interference in regard to style as in the case of the Houses of Parliament. No style was in the first instance imposed on the competitors, as in that case; but Scott having sent in a design in a somewhat Italian variety of Gothic, Lord Palmerston, who chose to constitute himself arbiter of taste for the nation (a self-assumed position for which he had about as little qualification as could be), obstinately refused to have anything to say to a Gothic design, and left the architect with the alternative of abandoning his most cherished convictions or relinquishing his commission. Some of Scott's best friends thought, not unreasonably, that he would have taken a higher position if he had stood to his colours and refused to sacrifice the artistic convictions which he had professed during his whole lifetime, especially as he had already made an almost unexampled success in his professional career. Whether, however, he would really have produced a building very superior to the existing one if he had been allowed to carry out his Gothic design may be questioned. His real power consisted in his mastery of ecclesiastical Gothic, and he did not possess, beyond this particular line of work, by which he made most of his reputation, a very high architectural faculty; he was seldom thoroughly successful when he quitted his peculiar walk, and his great façade to the St. Pancras Station shows that, even when left with a free hand as regards style, he did not succeed in producing a secular or business building which could command permanent admiration. At the time the St. Pancras Station was built it was thought so spirited and so splendid an innovation to build a Gothic railway station that great enthusiasm was excited in regard to the work; but now that the Gothic fever has died out it does not find many admirers, and it would very possibly have been the same with the Government offices had they been carried out according to the original Gothic design. There would probably, however, have been better detail than we find in the building as it now exists, in which the architect was working with materials with which he had no sympathy. Taken all round, the Government offices can be called no more than a respectable building; it has no originality, no breadth of treatment, and excites no interest. The best portion of it is the internal façade of the courtyard. The front towards Whitehall, it must in justice be remembered, is not carried out altogether as designed, as the angle pavilions were intended to have been carried up higher with some kind of cupola or other finish, which was cut off, from the spirit of economy which so often leads to the spoiling of our public buildings; and there is no doubt that with this accentuation of the angles the general effect of the front would be very much improved, though it could not atone for the generally commonplace character of the details. We may note one fact in connection with it which Mr. Wheatley does not mention, viz. that in regard to the westward portion of the buildings Scott was by official direction associated with Sir Digby Wyatt as joint architect, but we have no data for apportioning the precise part which each took in the work.

The new Law Courts was the next great official work. After two or three alterations of programme, twelve architects were, in 1866, invited to compete—Messrs. Abraham, E. M. Barry (the son of Sir Charles Barry), R. Brandon, Burges, T. N. Deane, Garling, Gibson, Lockwood, Seddon, Scott, Street and Waterhouse. The first in the list, an architect little known to fame, owed his invitation to some official influence. The others

* From the *Edinburgh Review*.

were selected for their reputation. The designs, which were sent in and exhibited in 1867, excited great interest, and unquestionably, in their variety and picturesque character, spoke highly for the architectural genius of England, though an eminent judge is said to have remarked, on visiting the exhibition, "I see a great many fine towers; but where are the courts?" Among them Burges's design was remarkable for its powerful treatment of a French type of Gothic; Mr. Garling's for great breadth and dignity; Scott's design displayed the same characteristics in a very different form; Barry's showed a novelty in a dome with Classic outline but Gothic detail; Mr. Seddon's was remarkable for a wild picturesqueness and for a colossal record tower, which was by no means so abnormal a conception as the public seem to have thought; Street's design also was characterised by picturesqueness and variety, with admirable treatment of Gothic detail. Gothic was all in power now, and few thought of protesting against it. Eventually the jury, among whom there was not a single artist or architect (again according to the usual absurdity of English practice in such matters), ruled that E. M. Barry's was the best plan (a verdict which was hardly questioned), and that Street's was the best design, and that, accordingly, Barry and Street should be appointed joint architects. As it had been before settled that plan was to count before design, there can be no doubt that E. M. Barry practically won the competition, and had a right to the appointment; and everyone who knew Street's character, his force of individual will, and his intolerance of any style of architecture except revived thirteenth-century Gothic, must have known that such a combination was practically impossible; and, indeed, the very idea of appointing one architect for the plan and the other for the design of a building was preposterous in itself. Street soon succeeded in pushing Barry out, and the latter was promised a great new design for the National Gallery, of which he was afterwards deprived, and put off with the task of merely carrying out the new rooms at the back of the Gallery—a double disappointment which, there is no doubt, shortened his life. It cannot be pretended that E. M. Barry inherited the genius of his father; practical knowledge and ability in planning were his strong points, and his Law Courts design evinced these qualities rather than architectural genius; but it would probably have been very much better for public convenience if he had received the commission which, according to the terms of the competition, he had justly earned.

Street's front to the Strand was designed on the principle (quite justifiable in itself) that it was of no use to attempt a grand façade of one homogeneous design on a site facing a comparatively narrow roadway, where it could never be properly seen as a whole; and it was, therefore, purposely broken up into a varied architectural scenery with no predominating design. Of the building generally, it is a difficult and rather a melancholy task to speak. It is at all events not commonplace, and the whole of the detail shows the hand of a master of Gothic architecture, more especially in the mouldings, which have the fulness and largeness of style characteristic of the Mediæval spirit, and every detail in the building was designed by his own hand. The design for the great hall was the object of a very uncalled-for attack by Fergusson, who, with all his breadth of insight into the conditions of architecture generally, was often singularly captious, unfair and irritable in his criticisms on special buildings, and who wrote letters in the *Times* against Street's hall on the mere ground that a narrow vaulted hall, like the nave of a cathedral, had never been used for such a purpose, and that it ought to have been a wide timber-roofed space like Westminster Hall. There seems no possible reason why what had never been done before should not be done now, and the *salle des pas perdus* of the Law Courts is a fine hall, and none the worse for being vaulted. But the building generally is sadly deficient, externally, in architectural dignity and refinement. The tower, if it can be called a tower, is probably the very ugliest erection of its kind that has ever been attached to an important building. The charge of inconvenience and bad acoustic properties, made against the courts themselves, has been a good deal exaggerated, especially by learned judges, who are, as a class, peculiarly hard to satisfy in these matters. But as to the general plan, with its rabbit-warren arrangement, its narrow and inconvenient staircases and tortuous passages, its dark corners and corridors where the light of day never penetrates, it is to be feared the building deserves all the unkind things that have been said about it. It is the work of an architect who had no genius for plan, and no breadth of architectural conception. Street's talent lay in giving beauty and dignity to parish churches, in which he has been surpassed by no architect of his generation. A multitudinous building like the Law Courts was beyond his powers, and he has left a legacy of inconvenience to generations of lawyers and clients, and all who are obliged to haunt what in this case are too truly "the dusky purlieus of the law," encased in a building which may be said to be, architecturally, the grave of modern Gothic.

The next attempt at a great Government building was an entire fiasco. In 1882 was published the new scheme of the Government for a site for the War and Admiralty Offices. Architecturally it was one of the worst-devised plans that could be. The competition for the proposed building took place in 1884, but it was a sad descent from the Law Courts competition. In that at least architects of genius took part, and produced a series of remarkable designs. The Admiralty and War Offices competition was a double one, a sketch competition open to all comers first, from which six were to be selected to compete again. But the terms of the competition were so drawn up that few architects of the first rank troubled themselves with the matter. A design was eventually selected. But even this was not to be carried out. The cry of "economy" was raised, and the whole was reduced to a patching up of the existing Admiralty building (a poor affair of Ripley's, the architect immortalised by Pope's cutting and certainly in this instance just satire), and the erection of an additional block of uninteresting building, now in progress, in the most economical manner. This is what we have descended to from Barry's grand plan of 1857. Something more than the loss of a great building is to be deplored; it is the loss of the spirit of artistic ambition in the nation. Public architecture is only an ornament of public life, but it is an ornament which speaks of much behind it. Every noble-minded society, in a state of prosperity, has desired to express its joy and its aspirations in noble buildings; and when there is no longer any care for producing noble architecture—when legislators, elected by popular voice, find that they will best recommend themselves to their constituents by raising the cry of "economy" whenever there is a question of spending money on producing something beautiful, the nation is infallibly going down hill. "In the youth of a state," says Bacon in his pregnant sentence, "arms do flourish; in the middle age of a state, learning; and then both of them together for a time; in the declining age of a state, mechanical arts and merchandise." The little kingdom of Belgium has recently spent an enormous sum in the production of a sumptuous law courts building which is the admiration of Europe. England has neither done nor cared to do any such thing since the erection of the Houses of Parliament.

OLD EDINBURGH.

THE freedom of the city of Edinburgh has been conferred on Sir Daniel Wilson, president of the University of Toronto, the author of "Memorials of Edinburgh," a work which is now being reprinted. In acknowledging the privilege Sir Daniel Wilson spoke of some of his associations with the city. From earliest years, he said, his feelings and sympathies had been intimately identified with all the ancient associations and historical memories of the capital of his native land. The old legends and traditions of its closes and wynds, the historical memories that haunted them were the object of his earliest study and investigations. Still memory fondly reverted to the old features, some of which abided, and some lived only in the past—the old West Bow with its Temple Bar, where predecessors of his lordship in the chair were accustomed to welcome royal brides and greet them with costly largess; Blythe's Close and its palace of Mary of Guise, with the faded beauty and grandeur which belonged to the time of her old regency; the old Trinity College Church—to protect which from destruction he had fought a keen battle—rich with ancient historical records illustrative of the characteristics of the transitional period that marked the reign of James II. and of the Queen to whose piety they owed the splendid memorial of the architecture of the fifteenth century, of which they had preserved still a fragment behind the new church in Jeffrey Street; the quaint Blackfriars' Wynd, with all its associations with the old Dominican Friars, with the good Bishop Kennedy, with the proud Cardinal Beaton, with the Douglases and the Hamiltons, with gentle Gavin Douglas, who in a barbarous age—

> Gave to rude Scotland Virgil's page.

All these were intimately associated in his memory, for the Edinburgh he mostly thought of was an Edinburgh—the Auld Reekie—of fifty or sixty years ago, "the romantic town" of Sir Walter Scott. To him the Edinburgh of that time was associated with a large circle of intimate and loving friends. The majority of them lived but in memory, and it was with peculiar gratification that he had realised on his return, after long absence, that still warm hearts greeted him, and he received the grasp of kindly and loving hands. Words were altogether inadequate to express his sense of gratitude for the honour that day conferred upon him that linked him with new ties to the city of his birth. Edinburgh was to him as Jerusalem was to the old Royal Hebrew; as the city of the Violet Crown was to the Athenian. He could say with all sincerity, "If I forget thee, let my right hand forget its cunning." Edinburgh was in the truest sense of the term the heart, not of Midlothian, but of Scotland. It was intimately bound up with the national history of that little corner of the land which had so many

associations and memories that the world would not willingly let die; for there through centuries the long battle was fought for liberty and independence which secured the treasure of the freedom they now enjoyed. He was familiar with many cities of the old world and the new, many of them with singularly attractive charms, but he knew of none that could compare in its beauty and its associations with their city, with the singular blending of its splendid site and the magnificent views it commanded on every hand of distant landscapes and the engirdling sea. Familiar as he was with the beautiful views obtained from the Calton Hill or the Castle Rock sixty years ago, he grieved now to find a veil of smoke, such as Auld Reekie did not know then, concealing its charms; and he could not help thinking that the Lord Provost might exert himself to compel the consumption of much of that obstructive smoke. But the greatest charm that belonged to Edinburgh lay in its historical associations; and what a story did it tell. The Roman footprints were not altogether yet effaced. The record of their Celtic kings survived. The old Oratory of St. Margaret, the Queen of Malcolm Canmore, happily survived, with the charming associations of that legend of one whose noblest virtue as a saint was that she was a true mother. Through the magnificent liberality of one of the worthiest of their citizens, the life-long friend of himself, the late William Nelson, they had recently received the gift of the restored banquet-hall of the ancient castle buildings, where kings had feasted through long generations and where Scottish Parliaments assembled in deliberation. When the Tay was deserted for the Forth, upon the assassination of the poet king, the Scottish Estates assembled in that very hall to inaugurate the succession of his youthful son. There the boy king, alternating between the castles of Edinburgh and Stirling, passed his remaining youth. At a later stage the young King James IV. spent his early years there, and witnessed from the windows of the banquet-hall the tourneys below. Thence he looked upon the muster of the host of Scotland upon the Burroughmuir that was to go forth to the fatal field of Flodden. After that disastrous event, in the banquet-hall and the surrounding chambers the youthful James V. and his poet tutor, Sir David Lindsay, passed their probationary years. There also Queen Mary gave birth to the boy that was to unite the crowns of England and Scotland, and pave the way for the interblending of the two nations. At a later stage Charles I. celebrated there his coronation banquet, and the interval was brief before Oliver Cromwell was feasted in the same hall by the Lords of the Congregation, under the very roof that legend told of the bloody bull's head being laid before the Douglases as a warning of their last meal. That hall was associated with a succession of chapters of Scottish history, and they could not too gratefully revere the citizen who had restored it. The associations of the Castle—those, for instance, relating to Kirkaldy of Grange—were too many to permit of mention within the limited time at his disposal; and he must not yield to the temptation to linger over the old memories that haunted the slope from the Castle Rock to the valley of the Holy Rood, or pause over St. Giles, the restoration of which they owed to the liberality of another citizen—an occupant of the chair the Lord Provost now adorned. There they had another series of chapters of history full of charms for him. They would pardon him if he said that after visiting Westminster, St. Paul's, St. George's Chapel, Windsor, and other like buildings, and finding the doors open and free to all, it was with a sense of shame he found that there was a charge for admission to St. Giles. He trusted that out of respect to him to whom they owed so splendid a gift as a restored St. Giles, they would throw the door open to the citizens to read the story still recorded there. There was the Preston Aisle, that told of the time when the gift of the bones of St. Giles was regarded as a noble and costly and pious contribution to the city. Alongside was the aisle of Walter Chepman, the friend and confidant of James IV., the Caxton of Scotland, to whom they owed the printing-press, but for which they should have lost the precious literature of Dunbar and Kennedy, and Douglas and others, who constituted that early intellectual era. There, also, they had memories of the first great Scottish scientific men, Napier of Merchiston; of the great and good Regent Murray of Montrose—and he learned that it was proposed to put up a counterpart to the Montrose tomb in a memorial to the martyred Marquis of Argyll—of the Duke of Albany, of the Earl of Douglas and of the reformer Knox. Such a place as St. Giles ought to be free to every child in Edinburgh to study as he would. Assuredly he could not be ranked among those

> Whose heart hath ne'er within him burned
> As home his footsteps he hath turned
> From wandering on a foreign strand.

It was his pleasure and his pride, as of many another Scotsman, to realise in far distant lands, as he had realised on the shores of Ontario, that still with other stars above them they were within the compass of the British Empire, under the same sovereign rule. They could scarcely conceive the feeling with which the old songs of Scotland were listened to by those who had followed in the footsteps of many earlier generations as wanderers on a distant strand. Their hearts still clung to the old mother home, and many a time in their hearts they

> Sigh for Scotia's shores, and gaze across the sea,
> An' canna get a glint o' their ain countrie.

RIEVAULX ABBEY.

AT one of the evening meetings during the visit of the British Archæological Association to York a paper was read by Mr. C. H. Compton on Rievaulx Abbey. He said that the abbey of Rievaulx, or, as it should be more correctly named, Rievall—the valley of the Rie—was the fourth earliest Cistercian foundation in England and the first in Yorkshire. It appeared from manuscripts in the British Museum that Rievaulx Abbey was founded in the year 1131, the three earliest abbeys of this foundation in England being Furness, 1127; Waverley, 1129; and Tintern, 1131. The Cistercian Order was founded thirty-three years previously—in 1098. The abbey of Rievaulx was founded by Walter Espec or L'Espec, a great man in the court of King Henry I. The popular account of the foundation of this abbey was thus given:—"Walter Espec had by Adelina, his wife, a son named Walter, a comely person, who, taking much delight in swift horses, was thereby thrown by one of them, who, being put out beyond his strength, stumbled, and he, falling from him, broke his neck, to the great grief of his parents, who wanted an heir for their great estate. However, taking advice of his uncle, Wm. de Espec, rector of the church of Garton, about the disposal of it, and was advised by him to make Christ his heir, at least to part of it, by building three monasteries, viz. Kirkham in the East Riding of Yorkshire, Rievaulx and Wardon in Bedfordshire." Mr. Compton went into the question of the exact year of the formation of Rievaulx, in reference to which three successive dates are named—1131, 1132 and 1133; and quoted authorities bearing on the point, remarking that if Mr. de Gray Birch's conjecture that the MS. Faustina was compiled from the archives of Citeaux itself was correct, the year 1131 would be the date of the foundation of the abbey. In the original charter, which was without date, Walter Espec granted certain lands, with the consent of Henry, King of England, and the counsel of Adelina, his wife, to God and to the church of St. Mary de Rievalle in the hand of William the Abbot and to the brethren of the abbey. St. Bernard sent over the monks who formed the first capitular body in 1128. They proceeded to form their order, clear the ground and erect suitable buildings, but at first only of a temporary character, so that at the time the charter was granted by Espec—supposed by Mr. J. C. Atkinson to be 1145—the monastery had been constituted; there was an Abbot William and brethren who, having formed a corporate body, could receive the grant which would supersede the informal gift to St. Benedict in 1131, although that was the real foundation of the abbey, and as such was registered in the abbey of Citeaux. This was consistent with the final clause of the charter:—"I, Walter Espec, have founded this abbey, Rievalle, &c., not by that charter, but previously as a reason for a grant contained in the charter." The date of 1132 given by the historian of Melrose might be a mistake, especially as he gave the same day of the month—March 3—as was given in the MS. Faustina, or it might refer to the abbey having got into working order. As to the date 1133, he had not met with anything which could give that date any preference over that of 1131. They might take it then that the year of grace 1131 saw the monks sent over by St. Bernard, with their first Abbot William at their head in possession of the land given to them by Walter Espec. William of Newburgh described the locality in which they settled at that time as a "horrid and vast solitude," and when we looked back upon this wild uncultured waste, and considered how much the sympathy we in these days feel for the beauties of nature arises from the higher culture of the mind and spirit, we might learn to appreciate at its full value the devotion of those old monks as they went forth under the primeval commission to replenish the earth and subdue it, and to develop the industrial activities of the country, and lay the foundations of English enterprise and English commerce, until in the words of the old Hebrew prophet, "The wilderness and the solitary places were glad for them, and the desert rejoiced and blossomed as a rose. The example set by Walter Espec was not long in bearing fruit, and the benefactors to the abbey were numerous, but he could not do more than refer to a few to which attention might be specially directed. A grant made by John de Ever, 1302, releasing all his right and title in the pastures of the forest or officers thereof, upon the account of their lands and tenements in Westerdale, as also of Brockton and Kirby-in-Cleveland, and the homages due to him on that account, contained a condition that if the said lands in part or in whole

should ever come into lay hands, they should return to him or his heirs. It would be interesting to know whether John de Ever's heirs resumed the rights he had thus granted, and it may be worth considering whether some such condition might not be inserted in modern grants to ecclesiastical uses, to counteract the effect of a policy of disendowment. Pope Alexander III., by his bull dated 12 kalend of December A.D. 1160, granted to Aldred, Abbot of St. Mary's at Rievals, his brethren and their successors, a confirmation of all their possessions with divers privileges, and in particular that they might celebrate the divine offices in the time of a general interdict, and Pope Alexander IV., by his bull some time before 1261, confirmed their exemption from tithes, explaining that this exemption extended also to the tithes of any lands which they either manured and ploughed themselves or held in their hands. To such an extent were these bulls granted to the Cistercian monks in England that in the second year of the reign of Henry IV. a statute was passed specially directed against "the religious men of the Order of Citeaux," imposing the penalties of premunire on them and "all other religious and seculars" who should put such bulls in execution. King Edward II., on the return from one of his expeditions into Scotland, and his nobility refreshed themselves at this abbey, and while there news was brought that the Scots came after in great power and with haste. The King and his nobles, minding more their meat than the safety of their subjects or their own honour, neglected the message, but the Scots pursuing eagerly their attempt, came suddenly within sight and compelled to shameful flight the King and his men, which never ceased till they had recovered York for their succour. At the Dissolution the site was granted in exchange for other lands to Thomas, Earl of Rutland, a descendant of Walter Espec, the founder of the abbey, and by Catherine, daughter and heiress of Roger, Earl of Rutland, became the property of her husband, George Villiers, Duke of Buckingham, whose son, the second Duke of Buckingham, sold it to Sir Charles Duncombe, knight. Thomas Duncombe, the grandson of Sir Charles, was the owner of the site in 1758. It now belongs to the Earl of Feversham, the head of the Duncombe family.

The members visited the ruins, which were explained by the Rev. C. Cox, LL.D., F.S.A. He said that the Cistercians resisted all meretricious show, and thus the work was as simple and plain as it well could be. His own church of Barton-le-Street, near Malton, which was one of the same date, showed much finer carving. When the Early English work was commenced, the Norman nave, which had now all but disappeared, was not interfered with. There was a difference in the two classes of stone used in the building of the two portions. In the early charters mention was made of canals and islands which did not now appear, and the river was dammed up some way up the valley, close to the Norman quarry, and the stone was sent down on floaters or rafts. For the Early English work stone of a closer material, some little way down the valley, was employed, and to bring it along the same expedient was used; but more engineering was required, as they had to get the water to run the opposite way. There was at Rievaulx a large room under the refectory, and this was probably where the conversi were engaged. Singularly enough the church stood north and south, and did not orientate owing to the lie of the ground. In a farm-house close by the abbey the party were shown a tesselated pavement *in situ*, which was believed to fix the locale of the abbot's quarters. The "capella extra portas," in a fair state of preservation, was pointed out, and Dr. Cox said that its existence showed that nobody was allowed to enter the abbey except guests, and those who were professedly religious. He might suggest that a body having the weight of a national association might endeavour to induce the noble owner—Earl Feversham—to resume the excellent work carried on three or four years ago in pointing and preserving the abbey. It was time this obligation was entered upon, if the abbey were to be saved from further decay. Upon consultation by the officials, it was agreed that the matter might be dealt with at a council meeting of the Association; and it was hoped that, as Lord Feversham was one of the vice-presidents, he would do what he could in so important a matter. Dr. Cox called attention to a huge slab, now in a palisade enclosure, supposed to have belonged to the high altar. The shafts of the triforium, which he believed to have been of marble, were now all gone, though they must have added very much to the beauty of the choir. The Gothic arch now seen at the beginning of the transepts was 75 feet high. It terminated in corbels instead of the clustered pillars being carried to the bottom, and perhaps looked better now than when it joined up to the somewhat clumsy Norman nave. The refectory, with a perfect reading gallery, was pointed out; and it was said that the size of the infirmary indicated that those who, three days a week, were allowed to take flesh meats, would use that apartment. A doorway leading from the "farmery" garth to the farmery was shown, having a cusped head and a carving of the Annunciation, similar to one in the Fountains Museum. Such carving was not usual in Cistercian houses, where the carving usually dealt with the figure of Christ. A lancet window at the east end of the church was pointed out as being of great beauty; and it was observed that where ivy did not pierce into the masonry, it often acted as a preserver and not a destroyer.

PRIMITIVE GREECE.

ON Monday, before the Anthropological Section of the British Association at Cardiff, Professor G. Hartwell Jones read a paper on "The Barbaric Element in Ancient Greece and Italy." The civilisation of Greece and Italy, which saved Europe from stagnation on both sides, is valuable, he said, for the study of the growth of institutions; it was evolved slowly from an original barbarism. But, as the classics are now read, their scientific value is obscured. Their history occupies a peculiar position—(*a*) geographically, they were influenced by two streams of culture converging, the Aryan and Eastern; (*b*) their growth was parallel; (*c*) both were similarly, but independently, affected by immediate neighbours. (i.) Whatever may be the truth about the seat of the Aryans, first they came south by land; secondly, they brought with them a high capacity for development, but were certainly not as advanced as Gobineau assumed. (ii.) They were both affected by Asia Minor, Assyria and Egypt, the North Semitic races being their intermediaries. The materials for reconstructing prehistoric society must be sought in archæology and nomology, as much as the science of language; this was seen by Hehn. The purpose of the paper is to show by means of a few specimens the anthropological value of the classics, aided by the excavations of Schliemann, Helbig, Chierici, &c., and Sanscrit literature, in the (i.) material and social; (ii.) mythological and religious aspects of Greek and Italian life. (I.) They passed through three stages—(*a*) hunting; (*b*) pastoral; (*c*) agricultural; but the transition was gradual. The animals hunted were the stag, bison and probably the horse; they used the fire-drill; fishing was a recent invention; religion was marked by ferocity. The change to agriculture humanised them; they fed on milk, meat, salt, spice, mead, and roamed in search of fresh fields. The ox left a deep impression upon language, custom and myth. It was the unit of wealth and the medium of exchange; the horse was first used for the war chariot; the supervention of horse-breeding later is reflected in language. The word for harvest was not known in the holoethnic period. Some tribes remained at the agricultural stage throughout; others—*e.g.* the Dorians—retained their old passion. The pile dwellings of the Terramare reveal cattle-rearing giving way to husbandry and vine-culture; no doubt Epeiros would exhibit the same progress. The Pelasgoi were essentially agricultural; the transition in Italy is reflected in legend. The first plough was the branch of a tree. Tillage was practised before horticulture. Agriculture left a deep impression upon language and life. The family was highly important in Greek and Italian life. Marriage clearly passed through the (*a*) capture; (*b*) purchase stage, and once polygamy prevailed; so too, levirate, the vendetta, the suttee, but not polyandria, as Bachofen maintained. Their primitive savagery is proved by the destruction of the aged and infanticide. (II.) The crudest form of their religion is—A. Animism, really a primitive philosophy. It may be divided into (*a*) spiritism, (*b*) fetishism. In both the spirit is cajoled or overcome by magic. Nowhere is the power of abstraction stronger than in Italy, to some extent owing to the influence of Etruria; the fear of these nebulous impersonal spirits and ill-omened plants was common; the fetish was widely distributed—*e.g.* the oracle of Pelasgian Dodona, a kind of instinctive meteorology. Further, animism was (*a*) vague, and (*b*) hypocritical. B. Naturalism characterises Greek mythology especially. At this stage those objects were chosen which bore some resemblance to man and promoted his welfare. Magic gradually disappears, but the spirit is not omnipotent—he even betrays weakness. Environment exerts an important influence here—*e.g.* in Etruria and Greece. A kind of totemism frequently occurs—*e.g.* the Hera-idols of the megalithic tombs of Mycenæ. Ovid's "Metamorphoses" was an attempt to account for the impersonation. C. Anthropomorphism is a nobler and more intellectual form of worship, with which idolatry is closely connected; in Greece, which was influenced by Phœnician art, it reached its perfection; in Italy it remained an exotic in spite of Etruscan artists. Thus their religion was (*a*) developmental, (*b*) acquisitive. It would be seen upon examination that—(1) Their primitive culture was on the level of that of many savage races of the present time; (2) the civilisation of Aryan Europe, as a whole, begins with contact with the East; (3) the criteria must be sought in other prehistoric sciences, not philology alone; (4) their civilisation is of paramount interest to anthropologists.

Miss Soames has given 1,000*l.* to the extension fund of the Maria Grey Training College, which now amounts to 9,000*l.*

NOTES AND COMMENTS.

The constables who have charge of the South Kensington Museum are models of watchfulness. From the care they take in guarding the treasures, they are found to be far better guides to an object than the officials who have only a perfunctory interest in the place. Yet a thief on last Sunday morning very nearly succeeded in evading the attention of the guardians. The museum being open until 10 P.M. on Saturday, he contrived to conceal himself, and during the night wrenched a case from the wall to which it was secured, and abstracted two gold bracelets, one gold locket, one gold cross, four silver brooches, one gold brooch, two solitaires and one stone earring. The value of them is 66*l.* 4*s.* The thief was seen by a constable early on Sunday morning, but he contrived to escape from the building. He was arrested in Prince's Gardens. The Museum is so well protected by the police, it is one of the last places where a robber could be expected to succeed. The police can hardly undertake to be more careful than hitherto, and therefore to prevent a repetition, it will be necessary to increase the number of guardians.

A patent has been obtained by Mr. Taylor, of the firm of Messrs. Lessels & Taylor, architects, George Street, Edinburgh, for an invention which he believes will be the means of preventing many accidents on railway lines. Frequently trains leave the rails through the driver failing to observe that the signals are against him, and much human life and property has been destroyed. Mr. Taylor proposes to lay a wire from the signal-box alongside the line of rails for a considerable distance beyond the signal-post, while on the engine there will be a small brush or wheel, which, when coming against the wire, will cause an electric current to ring a bell near where the driver stands. When the line is clear the contact of the wheel or brush with the wire will not be possible, and it is only when danger is signalled that the alarm will be raised.

During several years the attention of the directors of museums and wealthy collectors has been turned towards the Borghese collection in Rome. A gallery containing Raphael's *Entombment*; Titian's *Divine and Profane Love*, *Prodigal Son* and *Three Graces*; Correggio's *Danae*; the *St. Anthony* and *St. John*, by Veronese; the *Diana* of Domenichino; *The Visitation*, by Giorgione; *A Holy Family*, by A. del Sarto, besides hundreds of other genuine works, would be able to supply deficiencies in many collections. There are also some examples of ancient art which are still more coveted. When it was rumoured that the owner was in difficulties the treasures seemed to be within grasp, and it is said that a sum of about half a million sterling was offered for a part of the collection. But the Italian Government would not allow the principal masterpieces to pass out of the country. Some wealthy members of the family appear to have interfered, and for a time, at least, the collection is secured against dispersion.

The report of the President of Queen's College, Cork, states that the Council instituted lectureships in certain subjects in which a want of special teaching has long been felt. One was architecture, and Mr. Arthur Hill was selected for the lectureship. It is expected that the new courses will be commenced during the coming session. The authorities of Queen's College have set an example which should be imitated in other colleges. The engineering classes in the colleges of Belfast, Cork and Galway, have been successful, and we see no reason why architectural classes could not also send forth useful men. According to the report, the college itself might well provide practical examples of buildings which would benefit all the students as well as those in the architectural class. The want of room for a constantly increasing store of books becomes more pressing every year. Thousands of volumes have been stowed away in the entrance tower. The examination hall has been lined with shelves now fully stocked. The wall space in the geological lecture-room has been utilised. The librarian's private room has been annexed. A new library, therefore, appears to be urgently needed. Plans for such a building, including students' reading-room, waiting-room, &c., were made some years ago, but their adoption was prevented by various obstacles of a temporary nature. Another urgent want is that of a new chemical laboratory. In the present one there is accommodation for only thirty students. Of late years there has been an average attendance of nearly twice that number. Hence, the Professor has been obliged to divide his class into two sets at a cost of double labour, and of complicated arrangements to avoid interference with other lectures. A new laboratory could be provided in the building containing the new library.

The judges in the courts of Rennes will shortly have to give a decision which will throw light on the law as it relates to vandalism in France. The action is taken by the Municipal Council of Lorient against some of the inhabitants, most of them being young men, and the damages claimed amount to 2,000*l.* A statue of a local poet named Brizeux was lately placed in a public place of Lorient. But it gave offence to a party of young people, who may have had exalted theories about poetic composition. Accordingly, in June of this year the statue was overthrown, defaced and covered with tar. Action was taken against the vandals, and they were mulcted in damages, but they have appealed to the superior court of Rennes, with what result remains to be seen. The Municipal Council have decided to make an act of reparation to the deceased poet. On September 12, which is the anniversary of his birth, the members will march in procession to the cemetery, and deposit a wreath upon the poet's tomb. Throughout the day the statue will be draped in black.

Among the examples of primitive Irish art visited by the Royal Society of Antiquaries in Ireland during the excursion in Kerry, was the Oratory of Gallerus, which was supposed by Dr. Petrie to date from the fifth century. The door is 5 feet high and 2½ feet broad. At one end of the building is a small window, the frames and sills of which consist of one stone, with hardly a mark of a chisel. The building is about 20 feet long, 10 feet broad, and 20 feet high, and the walls are 4 feet thick. The joints of the stones are so perfect that it would be difficult to get a knife point between them. No mortar of any kind has been used in the structure. Some conjecture that these beehive-shaped structures were erected round a perfectly-formed mould of earth, and the keystones wedged in at the top. When completed the earth was cleared out through the doorway, and the walls finished off inside; but this is a speculative idea. In reference to these buildings and their origin Miss Stokes writes:—"It would appear that the monks adopted the method of building them practised by the natives before the introduction of Christianity, gradually making such modifications in form as their difference of purpose and some traditional usage required. Within the stone fort now become Christian, or the cashel built in imitation of it, the first Christians found shelter for their little oratories, their round beehive huts, their wells, gardens and *leachta*, or burial-grounds or *leabanmarb hars*, beds of the dead, as they are called, the oratories of these periods, and within these cashels are angular, oblong structures, with walls either sloping in a curve towards the roof, or built in steps, and often formed like upturned boats. They measure on an average 14 feet long by 9 wide and 12 feet high." It will be seen, therefore, that Gallerus is much larger than the average.

The house in the Rue Berryer, Paris, where Honoré de Balzac died, is about to be demolished. It was purchased by the Baroness Solomon Rothschild, in order that the site could be utilised to increase the grounds attached to her ladyship's mansion. In order that some record might be preserved of the last habitation in Paris of the greatest of French novelists, the Baroness has had no less than thirty-five photographic views produced, which represent the greater part of the house. There is no architectural merit about any of the rooms, but hereafter people may be glad to have representations of them, however commonplace may be the style. An album containing the photographs has been deposited in the Musée Carnavalet, where so many things relating to Paris are to be found. The door of Balzac's bedroom has been also sent to the Museum.

PANCO DE ESPANA, MADRID.

THIS imposing pile, said to be the largest and handsomest structure for commercial purposes in Europe, was completed and occupied in March last, and holds the same position in Spain as the Bank of England does in London. The main frontage is to the Prado, a magnificent boulevard some two or three miles long, where, in the season, all the nobility and *élite* of Madrid may be seen driving or riding very much as in our Rotten Row. The main front extends nearly 550 feet, and has three entrances, whilst another entrance is in the north front—to the Calle el Calla. The building rises to a great height, the principal rooms being 25 feet high in the clear. Above the ground level are five floors, four of which are appropriated to the business of the bank, and the upper or third floor is altogether set apart as residences for the staff and servants, many of whom live on the premises. The two principal cashiers have commodious suites of apartments at each end of the second floor. The principal entrance is from the Prado, where a magnificent marble staircase, built by workmen specially brought over from Italy, leads to the principal floors. Three more main staircases lead up from the other entrances, in addition to which there are four hydraulic hoists or lifts. Two large central courts, one on each side the main entrance staircase, give light to the interior of the pile. Nearly the whole of the basement is taken up with strong rooms for storing bullion and jewellery, and surrounding the whole building, below the street level, runs an ambulatory, where a number of armed guards parade day and night, and from where, by means of niches opening into the strong rooms, they can see all that goes on in them, and they have instructions to fire upon any burglar who may have gained an entrance to these treasure-houses. The remaining portion of the basement is used for the boilers of the heating apparatuses and for storage of fuel. There are twelve boiler-rooms and twenty-one boilers, from which radiate no less than 12 miles of piping, traversing the whole building. At suitable positions coils of piping are introduced covered with handsome electro-bronzed iron coil cases, of which there are 130. The contract for the heating has been carried out very successfully by Mr. Renton Gibbs, of Liverpool and Birmingham. The basement is fitted up with a series of strong-rooms, eight in number, for various purposes, such as notes, bullion, silver, copper, securities, &c. Each of these rooms is secured by massive steel doors, with gates of heavy description, furnished by Messrs. Hobbs, Hart & Co., of London, corresponding with those supplied by them to the Bank of England and branches. This firm have also produced some specially-designed locks for multiple control. The weight of the steel doors, with the frames and gates, ranges from 2½ to 4 tons each, and are much admired. Messrs. Hobbs, Hart & Co. are now completing for this Bank probably the largest steel-room in the world, being over 50 feet in length, 26 feet in width and 17 feet high, with a staircase and gallery and wrought-shaped balcony. The entrance is protected by another of the "Hobbs-Hart" steel doors as before described, and a manhole door of corresponding strength. There are four pairs of steel shutters to correspond, of similar strength, over 10 feet high. The electric lighting of the building is taken from the mains of the German company, between whom and the English company a keen competition exists for the lighting of Madrid. The architect for this important building is Señor Eduardo Adaro, of Madrid.

ARCHITECTURAL ILLUSTRATION SOCIETY. SECOND SERIES.

NO 401.—VIEW OF ROME. [THE LATE G. BASEVI.]

The Council of the Yorkshire College, Leeds, have appointed to the post of lecturer on sanitary engineering Mr. William Spinks, engineer to the Manchester and District Sanitary Survey Society, and of the firm of Spinks & Beever, civil engineers, of Manchester.

YORK MINSTER.

ONE of the first visits of the members of the British Archæological Association on the occasion of the meeting at York was to the cathedral. It was anticipated that Dean Purey-Cust would guide the visitors, but owing to his absence the task devolved on Canon Raine. On the party assembling, the Canon spoke of the importance of the building in the eyes of Yorkshiremen. Any harm to it would cause something like an insurrection in the county; while, if another fire arose, we should see, as had been witnessed before, a surprising exhibition of generosity. The reverence that all the people of Yorkshire had for that glorious fabric was a matter of common knowledge. Yorkshire was a huge county, cut into various sections, and this was the great centre which bound those sections together. The history of York Minster practically began on Easter Day, 607. A little wooden chapel had been put up, and in this the King of Northumbria, who had been brought over to Christianity by Paulinus, was baptized. Afterwards Edwin built a stone church, keeping the little wooden chapel inside it as a sort of relic. The King of Northumbria being killed in battle a very few years after, the church was finished by Oswald, one of his successors. That church was improved and enlarged in the same century by Wilfrid, the founder of Ripon, but in the middle of the eighth century the great changes that were taking place in York rendered a new church necessary. York had become a great University town. The School of York was something more than a school, in our acceptation of the word; it meant a great university. The York university was one of European fame, for from it the French universities took their origin; indeed, in York they had practically the starting point of the whole system of scholastic life throughout Europe. A new cathedral was, therefore, built, and it continued till the Norman Conquest, when William, in revenge for the defeat of some of his troops at York, destroyed the whole place, burning the cathedral and town. Consequently one of the first duties that fell to the first Norman Archbishop, Thomas I., was to build a new cathedral, and he constructed it in the Norman style, resembling Southwell very much. In the latter part of the next century, Archbishop Roger, a Frenchman, who was a great builder, had an opportunity of showing his architectural skill in repairing the ravages of a fire in the choir. They did not want much excuse in those days for introducing a new style of architecture, for they were only too glad very often to pull down the most glorious fabric simply to bring in something new. Roger built a new choir, and no change was made after that till the middle of the thirteenth century, when the architectural spirit had revived a little bit, and they thought they had in justice some excuse for making a little further change. The northern transept was undertaken by the Chapter of the time, and the southern transept was begun almost contemporaneously by the Archbishop, Walter de Grey, who built the nave of Ripon Cathedral. The transepts must have been built between 1239 and 1250; at all events, the south transept was complete when Walter de Grey's death took place, for his remains were laid there, and the visitors would presently see his beautiful towering monument. They had got now the old Norman nave, the Transitional choir of Archbishop Roger and two beautiful Early English transepts—what were they to do next? They began to build a new nave, Archbishop le Romayne laying the foundation-stone on the south corner about 1292. Between then and 1340 the existing grand nave was built. After an interval they turned their eyes to the choir, which must have been beautiful, judging by the remains, and it was resolved that it must come down. In 1363 Archbishop Thoresby began a new choir at his own expense, and he lived long enough to finish the four easternmost bays. On his death he was laid in front of the great east window, at his side being the remains of six other archbishops, he having removed their bones from different parts of the church lest they should be disturbed by the restoration which was going to take place. Thoresby died in 1373, and the Chapter did not complete the choir to the central tower till about 1405. It was a time when money was very scarce, and there was also very great difficulty in keeping masons, as when any royal personage or statesman wanted any work done he had a sort of press-gang system in operation upon the workmen. The real difficulties of the Chapter commenced when the Norman tower was reached. They did not dare to pull it down because that would have brought down the choir, nave and transepts, but they must, he thought, have made some attempt at that, for in one or two places there were signs of shrinkage in the neighbouring arches, and they must have taken warning by what they saw and desisted from the attempt. But they recast the Norman pillars with Perpendicular architecture, a very dangerous and critical operation. He (Canon Raine) regarded the choir screen—which on the face of it seemed so light and elegant, but in reality was many yards thick—as being actually a great buttress to the tower. It was found necessary to put it there in order to make everything quite safe. With that work completed they

had the interior of the fabric as it stood now. In the latter part of the fifteenth century the two western towers were put up, and the pinnacles and flying buttresses. Then there was the chapter-house, and that was a great difficulty in the architectural history of York Minster. They had no documentary evidences as to the building of it, but could form an idea of its date from the architectural details. It was Early Decorated work, and must date from 1280 downwards for twenty or fifty years. That the work must have been done very leisurely was proved by its elaboration. In viewing the Minster the thought arose, How did they get all that work done? The fact was that they only had a limited fabric fund of their own, but they could rely without any hesitation upon the unlimited generosity, particularly of all the people of Yorkshire. Any one who read the wills of the Yorkshiremen of the time when the work was going on would see how bequest after bequest was left for its continuance, the sums ranging from *6d.* to many pounds—and they must be multiplied by a considerable amount to bring them up to our present money value. It must be remembered also that the Chapter had their "brief bearers" going about the country begging money in every direction. Again, there were the offerings made at the shrine of St. William, the patron saint, and the moneys placed in the alms bags, which went for the most part to the great work of restoration. Canon Raine then mentioned the fires caused by Martin, who conceived a dislike to the organ, and in trying to burn it down destroyed the choir roof, and that caused by the carelessness of bell-ringers in 1840, which burned off the roof of the nave. How the stained-glass escaped was a marvel. Its preservation in the seventeenth century they owed to Fairfax, who, at the siege of York, ordered his men to blow out the brains of any one who interfered with it. Canon Raine pointed out the well-known Bell Founder's window, the Five Sisters' window—only so called because of the sisterly resemblance of one window to another, and containing some of the earliest, plainest glass they had; and afterwards the great east window, where the stone and the glass work help each other so admirably. The latter illustrates the Bible history, and is not only the largest in the country, but one of the most pleasing Perpendicular windows extant. The shrine of St. William, said the Canon, was in the place of the present altar. The old altar stood one bay forward from the present one. It was overlaid with gold and silver, and to set it off two great chancel windows, one depicting the life of St. Cuthbert and the other the lives of St. Wilfrid and St. John of Beverley, were built. The visitors afterwards descended to the crypt, where the remains of Saxon and Norman work are to be seen, and also visited the ornate chapter-house.

THE DEPARTMENT ART SCHOOLS.

IN his report on art schools and classes Mr. F. B. Barwell states:—

The duties undertaken by local committees appear to me to have been better fulfilled than formerly, and it has been comparatively rarely that one has had to report any laxity on their part in visiting the classes and signing the attendance registers. Schools of art and art classes, to which my attention has been more particularly directed, are, generally speaking, improving in their practice, and attendance a good deal augmented in consequence of the spread of drawing in elementary schools, teachers and pupil-teachers finding it more necessary than ever to qualify under our rules. The introduction of light and shade as one of the five subjects in second grade has further stimulated these classes, and it is found to have rendered drawing a great deal more popular than formerly. In schools of art the necessity the masters are under to pass their pupils in freehand outline in order to obtain the grant causes, in my opinion, a longer time to be spent on that stage than would be otherwise desirable, and as the natural tendency is for the standard to become gradually raised, the result is likely still further to retard the progress of the student towards higher work. I would myself suggest that the standard for freehand be lowered rather than raised.

Many of the art masters find it difficult to resist the demands of their pupils in the morning classes to waste their time in copying from landscape examples (many of them chromo-lithographs) on the plea that their classes would otherwise materially diminish. I am convinced, from the experience of those masters who refused to be dictated to, that they are mistaken. If these same pupils are prepared to spend, as they nearly all do, some years of drudgery in learning to play only moderately well on a musical instrument, they would, if the master were firm enough, go through the necessary drill in order to acquire a respectable facility in art. Nor should these morning classes be treated as of no consequence: their higher fees help to keep the school going, and they belong to the buying classes, for whom the manufacturer of artistic production caters, and, unless those classes have their taste cultivated in good directions, the demand for the better kinds of art will not spread, and the manufacturer will remain content not only to supply bad things but to dispense with well-trained designers.

In all schools of art there are a certain number of students who very naturally desire to paint, and there is no better practice for such than the study of still life, but it seems as if the majority of the teachers are unable to get out of the well-worn groove of combining a number of objects that have no sort of connection with each other, nor with the ever-present piece of drapery or bas-relief as a background. The groups have no possible human interest such as we see in the accessories of many of the greatest painters of almost all schools, and are, in general, much too elaborate for beginners to cope with successfully. In placing casts, especially busts, they are generally presented to the student with the greater part in deep shadow, the strongest relief being wrongly considered an almost necessary condition.

In England, the desire to make use of the money transferred by the Local Taxation (Customs and Excise) Act to the county or borough councils for educational purposes is very widespread, and in one large city where the existing rates reach about *9s. 6d.* in the pound, the local authorities have resisted the temptation to apply the money to the relief of rates, and have resolved to use it entirely for educational purposes.

In Scotland, many of the schools of art are mere adjuncts to intermediate or high schools, and are not worthy of the name, the bulk of the art (?) work being second grade drawing of a very rough kind, done by the boys and girls in the daytime, the evening classes in such instances ranking no higher in aim than an ordinary art night class. On the other hand, in the large cities, the schools of art occupy a very good position in the kingdom.

Through the connection recently established in Ireland between the Department and the large training college at Drumcondra, and the still larger organisation of the Christian Brothers, drawing under the Department's rules in Irish elementary schools is likely to spread, science having for some years obtained a firm footing there.

THE HISTORY OF CARTOGRAPHY.

THE address in the Geographical Section of the meeting of the British Association at Cardiff was delivered by Mr. E. G. Ravenstein. He said:—We can hardly conceive of Joshua dividing the Promised Land among the twelve tribes and minutely describing their respective boundaries without the assistance of a map. A plan of Rome, the only document of the kind which has survived, is engraved on slabs of marble on a scale of 1·300, and was originally fixed against a wall of the Roman town hall, so that it might be conveniently consulted by the citizens. Of the existence of earlier maps of the world, or even of provinces, we possess only a fragmentary knowledge. That maps grew popular at an early age is proved by Aristophanes, who, in his comedy of "The Clouds," 423 B.C., has a map of the world brought upon the stage by a disciple of the Sophists, who points out upon it the position of Athens and of other places familiar to the audience. A real advance in cartography was made when Dicæarch of Messena (390–290 B.C.) introduced the parallel of Rhodes. This "diaphragm" was intersected at right angles by parallel lines representing meridians. Ptolemy of Alexandria introduced reforms into the methods of representing the earth's surface which fully entitled him to the foremost place among ancient cartographers. Before a map like his could be produced much preliminary work had been accomplished. The gnomon, or sun-dial, an instrument known to the Chinese 600 years before Christ, had long been used for the determination of latitudes, and the results were relatively correct, although uniformly subject to an error of sixteen minutes, which was due to the observers taking the altitude of the upper limb of the sun when measuring the shadow-case by their dial, instead of that of the sun's centre. It was known, likewise, that differences of longitude could be determined by the simultaneous observation of eclipses of the sun or moon, or of occultations of stars, and Hipparchus actually calculated Ephemerides for six years in advance to facilitate computations. Ptolemy himself suggested the use of lunar distances. But so imperfect were the astrolabes and other instruments used by the ancient astronomers, and especially their time-keepers, that precise results are quite out of the question. Ptolemy, in fact, contented himself with accepting eight latitudes determined by actual observation, of which four were in Egypt, whilst of the three longitudes known to him he only utilised one in the construction of his map. No copy of Ptolemy's original set of maps has reached us. An examination of Ptolemy's maps shows very clearly that they were almost wholly compiled from itineraries, the greater number of which their author borrowed from his predecessor Marinus. During the "Dark Ages" which followed the dismemberment of the Roman Empire there was no lack of maps, but they were utterly worthless from a scientific point of view. The achievements of the ancients

were ignored, and the principal aim of the map-makers of the period appears to have been to reconcile their handiwork with the orthodox interpretation of the Holy Scriptures. Hence those numerous "wheel maps," upon which Jerusalem is made to represent the hub, whilst the western half of the disc is assigned to Europe and Africa and the eastern to Asia. The Arabs were great as travellers, greater still as astronomers, but contemptible as cartographers. Their astronomers, fully possessed of the knowledge of Ptolemy, discovered the error of the gnomon, they improved the instruments which they had inherited from the ancients, and carefully fixed the latitudes of a great number of places. Quite a new epoch in the history of cartography begins with the introduction of the magnetic needle into Europe. It is only natural that the Italians, who were the foremost seamen of that age, should have been the first to avail themselves of this new help to navigation. Germany, debarred from taking a share in the great maritime discoveries of the age, indirectly contributed to their success by improvements in mathematical geography and the introduction of superior instruments. The navigators of the early middle ages still made use of an astrolabe when they desired to determine a latitude. Great difficulties were experienced in the observations of longitudes. Lunar eclipses were most generally made use of. A congress of Spanish and Portuguese navigators met at Badajoz and Yelves in 1524 for the purpose of laying down the boundary line, which Pope Alexander VI. had drawn at a distance of 370 Spanish leagues to the west of Cape Verd Islands, to separate the dominions of Spain from those of Portugal. Not being able to agree either as to the length of a degree, nor even as to that of a league, they separated without settling the question placed before them. So uncertain were the results of observations for longitude made during the sixteenth and seventeenth centuries that it was thought advisable to trust to the results of dead-reckoning rather than to those of celestial observations. But the method of dead-reckoning is available only when we have a knowledge of the size of the earth, and this knowledge was still very imperfect, notwithstanding the renewed measurement of an arc of the meridian by Snellius, the Dutch mathematician (1615). This measurement, however, is remarkable on account of its having for the first time applied the exact method of triangulation to a survey. The problem of measuring the ship's way had been attempted by the Romans, who dragged paddle-wheels behind their ships, the revolutions of which enabled them to estimate the distance which the ship had travelled. The eminent position which Italian cartographers occupied during the fourteenth and fifteenth centuries had to be surrendered by them, in the beginning of the sixteenth, to their pupils, the Portuguese and Spaniards, upon whom extensive voyages and discoveries had conferred exceptional advantages. These, in turn, had to yield to the Germans, and later on to the Dutch, who were specially qualified to become the reformers of cartography by their study of mathematics and of the ancient geographers, as also by the high degree of perfection which the arts of engraving on wood and copper had attained among them. German mathematicians first ventured to introduce the long-neglected geographical projections of Hipparchus and Ptolemy, and devised others of their own. The German cartographers of that age are to be commended, not because they copied Ptolemy's maps, for in this they had been preceded by others, but because they adopted his scientific methods in producing maps of their own. Their reforms began at home, as all reforms should. They were amply supported in their efforts by the many astronomers of note of whom Germany then boasted, and by quite a staff of local "geographers," of whom nearly every district of the empire boasted the possession of one. Perhaps the earliest general map of Germany, and certainly one of the most interesting, was that which the famous Cardinal Nicolas of Cues, or Cusa, completed in 1464, the only existing copy of which is to be found in the British Museum, where it was "discovered" by Baron Nordenskjöld. Mr. Ravenstein continued this historic sketch of progress, noting the introduction of the telescope, the theodolite, the sextant and the camera, the discoveries of the aberration of light and of the mutation of the earth's axis, the invention of instruments for measuring the depth of the ocean and the use of colour in maps. The credit of having done most towards the promotion of cartography in the course of the eighteenth century belongs to France. It was France which first equipped expeditions to determine the size of the earth; France which produced the first topographical map based upon scientific survey, a work begun by César François Cassini in 1744, and completed by his son five years after his father's death; it was France, again, which gave birth to D'Anville, the first critical cartographer which the world had ever seen. D'Anville (1697–1782) swept away the fanciful lakes from off the face of Africa, thus forcibly bringing home to us the poverty of our knowledge, and boldly refused to believe in the existence of an Antarctic continent carrying half the southern hemisphere. Whilst France led the way, England did not lag far behind. Since the beginning of the present century Germany has once more become the headquarters of scientific cartography, and this is due as much to the inspiriting teachings of a Ritter and a Humboldt as to the general culture and scientific training, combined with technical skill, commanded by the men who more especially devoted themselves to this branch of geography, which elsewhere was too frequently allowed to fall into the hands of mere mechanics. And now, at the close of this the nineteenth century, we may fairly boast that the combined science and skill of surveyors and cartographers, aided as they are by the great advance of the graphic arts, are fully equal to the production of a map which shall be a faithful image of the earth's surface.

FOUNTAINS ABBEY.

THE members of the British Archæological Association were invited by the Marquis of Ripon, K.G., to luncheon at Studley Royal, and his lordship was thanked not only for his hospitality, but for the care he has taken of the remains of Fountains Abbey. The building was described by Mr. Loftus Brock.

At the commencement he referred to the movement which took place about three generations after the Norman Conquest, which resulted in the formation of an enormous number of religious houses throughout the country. Following those under Benedictine and Augustinian rule came the foundation of Cistercian monasteries, resulting from a desire for more stringent rule of life among both ecclesiastics and laymen. The abbey at Fountains was the outcome of this rising. The Benedictine Abbey of St. Mary's, York, had become so wealthy that the monks came to be more careful for their ease than for the service of their great Master; and certain monks of that house banded themselves together to urge upon the abbot their wish for a stricter life, and begged for leave to found another Cistercian Abbey, four having already been instituted. They were treated, as minorities often were, with little respect, being taxed with a wish to get rid of their vows. They found a friend in the Archbishop of York of that period. That dignitary visited St. Mary's one day, according to his right as metropolitan, and at first, after he had been refused admission, the monks declined to listen to his address. Consequently the Archbishop, finding that the thirteen monks were in earnest, helped them to Fountains, and gave them certain churches of no great value at that time. The valley was not as now, and much of the stone for the building of the abbey must have been cut out of the rock close by. Going to Fountains in December 1132, they took shelter under spreading trees. A few winters with slender resources led them to think of leaving England; but just at that moment money began to pour in, the Dean of York joined them, and they began to erect the church. Mr. Brock then proceeded to point out the different features of the abbey, and indicated how much of the original Norman structure still remained as part of the present fabric, stating that these portions showed that the original buildings were of the same dimensions as those now existing. Afterwards, however, the monks of Fountains interested themselves so closely in the election of a certain Archbishop of York that their persistency aroused the ire of the minority, who came to Fountains and practically destroyed the work of so many arduous years. Mr. Brock said that the fact that the interior of the buildings had been plastered and whitewashed seemed to have escaped notice, but the evidence was abundant. The nave was marked by great dignity. In his view, there were only 34 or 35 ritual monks in the Abbey; and although there might be lay brethren there, he did not believe in the existence of conversi, either here or elsewhere. Both the east and west windows of the church had been inserted in place of the Norman work. In York an old doorway had been built into the church of St. Denis because of its beauty; but, speaking generally, they must never look for the exhibition of any regard in those times for anything previously existing, since when they wanted a change they made it whether the new were better than the old or not. At the eastern end of the monks' choir tiles had been inserted here and there to increase the resonance of the building; but these were not often met with, and it might be inferred that the plan met with no great success. The tower was originally built at the intersection of the transepts and the nave; but the erection of a large, ugly buttress internally, and shrinking elsewhere, showed what resulted, and only one complete pier now remained. The present tower, in almost an entirely complete state, standing at the north end of the transept, was built by Abbot Huby, 1494. It was a most interesting specimen of the Perpendicular. The tracery of the windows was very plain and without cusps, and yet it was most effective. The Cistercian monks, however, did not require, in accord with their ascetic life, architecture of an expensive kind. But the tower was erected 300 years after the monastery was founded, and between the two periods the monks had become less fond of rigid living and spent their money in fine buildings. The magnificent choir, with its nine altars, preceded the erec-

tion of the nine altars at Durham by 30 or 40 years. The choir was, in Mr. Brock's view, the most masterly piece of Early English in Yorkshire; the choir itself was vaulted, and besides having a slender and delicate column dividing it from the transepts, the column was doubtless banded, and had pretty shafts of polished marble, making them more charming than now seemed to have been the case. Passing through the cloister court, the party found themselves in the chapter-house divided into three aisles, which must have been vaulted. Here the abbots were buried, and several tombstones had been discovered. The refectory was shown, and Mr. Brock thought the question of which was the kitchen and which the warming-house had not yet been decided. The day-room, dormitory, prisons and infirmary were next shown. The latter had been one of the largest of the group of buildings, and was probably erected 1250.

PIETRO ROSA.

THE death is announced of the Senator Pietro Rosa, the excavator of the Palace of the Cæsars. He died, says a correspondent of the *Scotsman*, on the scene of his grandest achievement, the Palatine Hill, in the house built for him by Napoleon III. more than twenty years ago, when, at the instance of the Emperor, he undertook the excavation of the birthplace of the Eternal City.

Born November 10, 1810, in Rome, of a distinguished family, which among its scions could point to the artist and man of letters, Salvator Rosa, he gave early indications of special genius at the Academy of St. Luke, where he carried off prize upon prize, and was, in consequence, while still a youth, voted an Honorary Fellow. He worked for some time in the studio of the great Canina, and thereafter became domiciled with the Borghese family, at whose instance he rearranged their celebrated gallery, and made both their villa and palace the perennial resort of the archæologist and the art student from every clime. In his thirty-seventh year, Pius IX.'s short-lived incursion into Liberalism found an enthusiastic auxiliary in the now-famous architect and connoisseur, who for a time abandoned his studies to organise the civic battalion of the Campus Martius But Radetsky's advance on Ferrara was too much for the vacillating Pontiff, and the Liberal cause had to cave in for a season, till in 1849 the triumvirate of Mazzini, Saffi and Avezzana took the place of the fugitive Pius, and presently had to defend itself against the expeditionary force sent by Republican France to suppress it. Again Rosa came to the front, working as Michel Angelo did at the siege of Florence, and not only designed the fortifications, but took a soldier's part in manning them. He shared in the victory of Garibaldi on April 30, and also in the collapse of the triumvirate a few weeks after it, losing the patronage of the Borghesi and coming so pointedly under the censure of the reinstated Pope, that he had to go into hiding in a secluded vineyard near the catacombs of St. Sebastian on the Appian way.

In this retreat he resumed his studies, setting himself to trace the grass-grown highway and its sepulchral monuments, and crowning his work with a singularly accurate and detailed plan of it between Rome and Albano. This, with the relative letterpress, found special favour with the German Archæological Institute, and stimulated him to extend his studies in the Alban territory, so as to include the magnificent villa erected by Pompey, and afterwards extended by the Cæsars on the left side of the Appian. Then, too, he began the unique work, unfortunately never completed, the topographico-archæological maps of Latium, which, even in its unfinished state is the admiration of every scholar who has had access to the library whose walls it adorns. Special results of this study, however, are now the common possession of cultured humanity—his identification of the site of the temple of Diana on Lake Nemi; that of the battlefield on the Allia, and even his elaborate indication of Horace's villa near Rocca Giovine, though this has had its plausibility lessened by the masterly vindication of the older site on the Digentia by that able Dublin scholar, the Right Hon. J. A. Lawson.

About the years 1863-64-65, the Emperor Napoleon, for dynastic reasons, undertook his "Life of Julius Cæsar," and of the many *savans* whom he pressed into his service, Pietro Rosa was among the first. Having purchased for a very large sum the Farnesian Gardens on the Palatine, he entrusted Rosa with the excavation of them, in the hope, destined to be so brilliantly justified, that the palace, or rather palaces, of the Cæsars would at length be brought to light. Having built a house for him on the hill itself, just fronting the Basilica of Constantine, the Emperor wisely left him uncontrolled as to action, and practically unlimited as to funds, and in a few years the results evoked the admiration of even the German Institute in the capitol—the most formidable, and not always the most amiable, tribunal to which the Italian or French archæologist could appeal. It is to Rosa that the scholarly as well as the unlettered tourist is now indebted for whatever of distinctness he carries away with him in his impression of the Palatine, and though controversy has arisen, and will never, probably, be laid, as to the absolute certainty of some of Rosa's "identifications," it is safe to say that those suggested in their place are much more vulnerable at the hands of criticism. Unfortunately, the events of 1870 put it out of the Emperor's power to assist Rosa towards the completion of his work. The Palatine had to be ceded to the Italian kingdom, and though Victor Emanuel's Ministers wisely retained the veteran excavator at his post, they have never been able to keep him in funds sufficient for the prosecution of his operations. As if to compensate for his restriction as to means, the Italian Government increased the area of his nominal activity, making him superintendent of the (contemplated) excavations, not only of the Palatine, but of the whole Pontifical territory, including Ostia, on the Latin shore, the villa of Hadrian, and the Roman Forum itself. The little he has been able to do in those fields is now known, through innumerable guide-books, to every tourist; that little, as in the case of the Colosseum, amounting only to an indication of what might be done if the Government could spare from the Budget of Public Instruction an adequate allowance for carrying it to completion.

Of late years Rosa has been in the background, enjoying the honorary post of Inspector-General of Antiquities and the Fine Arts, while the active work of excavation, such as it is, has been admirably done by Fiorelli and Lanciani, the former eminent for his brilliant operations at Pompeii, the latter famous for his bringing to light the House of the Vestals, to say nothing of other scarcely less admirable monuments of sagacity, scholarship and perseverance. Neither of those distinguished men have reason to be other than proud of their predecessor, acknowledged as he is by archæologists of every school to have laid their common "mystery" under the deepest obligation. To the stranger in Rome few more interesting sights met the eye than that of the veteran excavator guiding some royal or patrician or world-famous guest over the undulations or through the labyrinth of the Palatine, explaining to them the structures he had brought to light and dwelling wistfully on those he knew to lie beneath the surface, whose discovery, however, was destined for other hands. That sight had recently become rarer and rarer, till

One morn we missed him on the accustomed hill.

Perhaps no Italian of this century possessed so many honours, decorations and marks of respect as Pietro Rosa, from St. Petersburg to Madrid, from Berlin and Vienna to Rio Janeiro. To say nothing of the literary and scientific bodies of his native land, the insignia of royal esteem or of learned and artistic admiration came to him in showers. His funeral on the day after his death was attended by all that was most distinguished or estimable in Rome, and "he now rests from his labours" in the Campo Verano, on the fringe of that Campagna whose past he did so much to disclose.

LANGLEY CHURCH, BUCKS.*

LANGLEY was originally connected with Wyrardisbury, to which place this church was a chapel-of-ease. The church is supposed to have been built by the Kidderminsters, for a long time resident in the parish, and who obtained the manor in 1626. The present structure was probably built in the reign of Edward III., whose arms, the three lions of England, appear in one or two windows, as also the letters "Ed." in a window in the aisle. There are several other fragments of stained-glass, including a very good figure of a saint in the east window of the aisle, and the Jacobean coat-of-arms in stained-glass above it. It would appear as if the chancel was the first to be completed, the decorated work here being much finer and better in design than in the aisle. There are no traces visible of any earlier work, but this is very good of its kind, and the church carving, though repaired in some places, is wonderfully preserved, that on the pillars being particularly good. It will be noticed that whereas the east window of the nave has columns on each side, that of the aisle has none. Again, the windows of the aisle are placed in recesses far inferior and certainly later than those of the chancel. The floor of the chancel was at one time probably much higher, as is shown by the masonry remaining at the bases of the pillars and also by the sedilia. Outside the windows have been "made good" with plaster, which is causing the stone beneath to decay rapidly. There is a rather curious perpendicular window in the south wall of the nave, now blocked up, behind which is the library. The tower appears to be very modern.

The Kidderminster pew or chapel and burying-place was built by Sir John Kidderminster in 1626, as also the library. The books in it are of no great interest, being almost entirely

* A paper by Mr. R. H. Russell, read at the meeting of the Bucks Architectural and Archæological Society.

theological. The paintings on the cupboard doors are very interesting and of considerable merit, and represent scenes in Windsor, Eton and Langley Park. Unfortunately there is no tradition as to who was the artist. There is also a portrait of Sir John Kidderminster on the inside of one of the cupboard doors.

There are a number of monuments and achievements in the church to the families of Kidderminster, Hubert, Swabey and others, besides those in the Kidderminster chapel to the Bateson Harveys. The quarterings of Hubert are very fine. The big monument in the chancel commemorates Edmund Kidderminster ("Unius sex cleric. almæ curiæ cancellar.") and his wife Anna, daughter of John Leigh, of Addington. He died in 1607 ; she 1618. Also John Kidderminster, who died 1558 ; and his wife Elizabeth, who died in 1590. There are also several brasses in the floor to the memory of John Bowsare, gentleman, 1608 ; Elizabeth, daughter of Roger Giffard, 1434 ; John Boteler and wife, Matilda, *circa*, 1440 ; Thomas Bowsare, 1572 ; Julian, wife of Edward Higgins, 1603.

At the time of Doomsday this manor was included with Wyrardisbury. In the reign of Edward I. it had passed into the hands of the Crown, and in 1447 it was conveyed to Eton College. But it again reverted to the Crown, and in 1492 was granted by Henry VII. to Elizabeth, Queen Consort. Henry VIII. granted it to Katherine, Princess of Wales. Again, in 1523, he granted it to Henry Norres, Esq., for a knight's fee. The same king granted it in 1540 to Sir Anthony Drury. Edward VI. granted it to his sister Elizabeth. In 1626 it was granted by patent to Sir John Kidderminster, whose daughter and heiress Elizabeth carried it to Sir John Parsons, of Boveney. Sir John was created a baronet in 1661, and after his decease the property was sold to Edward Seymour in 1669. His son, Henry Seymour, succeeded to him, having been created a baronet, at the age of seven, during his father's life-time. Dying unmarried in 1714, his estates passed to his cousin, Sir Edward Seymour, Bart., whose son, Sir Edward, sold it to Lord Masham. The latter sold it to the Duke of Marlborough, who conveyed it by deed, dated 1788, to Sir Robert Bateson Harvey, grandfather of the present owner.

There are two sets of almshouses to the north and south of the church, built by Sir John Kidderminster and Sir Henry Seymour.

THE YORK GUILDHALL.

IT appears from a paper by Mr. J. S. Rowntree that the York Guildhall was built in the latter part of the reign of Henry VI., being begun in 1446, though it was not finished till after the discovery of America by Columbus. It occupied the site of a previous hall, sometimes called the Common Hall, belonging to the Guild of St. Christopher, in which the Corporation "held their general assemblies and courts of pleas, and celebrated their solemn feasts." The Guild of St. George having been joined to that before-named, it was in November of the 24th year of King Henry VI. that the Mayor and Commonalty agreed with the Master, Brethren and Sisters of the Guild of St. Christopher to build a new hall at their joint expense. The Guild of St. Christopher began its career in York in the reign of Richard II. Like other religious fraternities it was suppressed at the time of the Reformation, and its stipulation with the Corporation to occupy the hall for ten days at the festival of St. James the Apostle, with "reasonable convenience for placing and keeping wine," necessarily fell into abeyance. The architecture of the Guildhall is Perpendicular Gothic. The hall is 93 feet in length, 43 feet in breadth, and 29½ feet in height. The roof of open timber-work is supported by ten octagonal oak columns, each being cut out of a single tree. Tradition says these noble trees grew in the forest of Galtres. Sutton-on-the-Forest is sometimes stated, it is not known on what authority, as the site whence they came. The ceiling displays shields, grotesque figures and curious heads, some of which are said to have been brought from St. Anthony's Hall. It is conjectured by Mr. Davis that the bosses of the ceiling display the trade or heraldic marks of merchants who were donors to the building fund. Thomas Jameson, lord mayor in 1504, and John Dodgso, who filled the office four years later, each gave sundry "waynscotrs" towards the "selying" of the walls, and their marks are probably amongst those which still look down on the crowd beneath them. For more than three hundred years the windows in the Guildhall were only filled with louvre boards admitting air as well as light. In 1760 they were glazed. The plain glass then introduced has undergone replacement by stained-glass, representing events connected with the history of York. Returning for a moment to earlier festivities in this hall, there is a quaint record of one that was celebrated in 1487, before the building was finished. In that year "the Earl of Northumberland presented the Lord Mayor and Corporation with eight bucks and five marks in money, to be disposed of for the solace and recreation of them and the citizens, the Guild of St. Christopher contributed a further sum of 7*l*., and a party of between six and seven hundred assembled in the Guildhall, and had a worshipful recreation, solace and disport, with bread, ale, venison, roast and bakyn, and red wine in abundance, without anything paying for the same." The chapel of the Guild of St. Christopher and the common kitchen which adjoined the common hall, occupied the ground on which the Mansion House now stands. The chapel in the eighteenth century had fallen to the condition of an ale-house, perhaps retaining an allusion to its former ecclesiastical use in its sign of the Cross Keys. One of the Corpus Christi plays was always performed opposite this building which was occupied by the Lady Mayoress and her sisters, as the aldermen's wives were styled, as a good standpoint from which to witness the pageant. The architect of the Mansion House was Richard Boyle, Earl of Burlington, and it was completed in 1726, and the first great feast was given by the Lady Mayoress (Lady Clarke), and was called the Lady's Feast. It was the precursor of a long succession of festivities ; indeed in 1724 the Lord Mayor was required by minute of the Corporation to have two public dining days in every week, the days to be specified at his installation. There was at that time a substantial stipend attached to the office, an arrangement which has long ceased to exist.

EARLY EARTHWORKS.

A PAPER by Mr. Charles Lynam, architect, on "Earthworks of Early Date," was read by him at the meeting of the British Archæological Association at York. He said he proposed to consider examples of earthworks of remote date, which were situated for the most part within the county of Stafford. These earthworks, he said, were for the purpose of succour and defence. There could be no question that they formed a series along a continuous course. They bore internal evidence that they were constructed by the same people, as all their main characteristics were strikingly similar. In any case, their situation was on high ground, from which full command was had of their immediate surroundings, and of very extensive distant prospects. In fact, from each of them a clear panoramic view of vast extent was obtained of the surrounding country. In each one or more sides was immediately bounded by steep natural slopes. Their top was irregular in form, the sides next the slopes taking the form from the upper edges, and the other sides were circular and not rectangular in form. The mode of construction seems to have been as follows :—The site having been carefully selected, with command and defence in view, and the size determined upon, the ground within the prescribed area was used for procuring the necessary materials for the walls by excavation. That material was thrown up into single banks along the lines of the adjacent steep slopes about 6 feet in height. On the other sides, from one to three banks were thrown up with a corresponding number of ditches of varying width and depth, the importance and magnitude of these walls and entrenchments being determined by the nature of the adjoining lands. When they were flat and easily approachable the works of defence were the strongest, but where any natural obstruction to the approach existed by slopes or otherwise the works of defence were reduced to a minimum, but what they always afforded was an internal area of from about three acres to about ten acres in extent. Enclosed within was a raised bank, outside of which was either a steep natural slope to the hills or raised mounds and sunk ditches, giving to those within the enclosure a security from surprise, and a very formidable defence against an invading foe. Mr. Lynam then gave descriptions of various earthworks and camps, including those at Bury Walls, Billington, Berth Hills, Kinnir Edge, Chesterton, and, in conclusion, said it would be seen that the county of Stafford was not merely to be dubbed a black country, covered only with collieries, ironworks and potteries, but that amongst other interesting archæological possessions it held within a very short compass works of the Roman invader and of our Saxon forefathers well deserving of attention, and capable of exciting the liveliest interest of anyone given to early archæology.

In reply to questions, Mr. Lynam said that there was no appearance of there having been any breastwork whatever on the banks, which were formed to a considerable extent of rubble stone, evidently dug out of the sites, and mixed with boulders from the immediate neighbourhood.

The Chairman, the Rev. Canon Raine, said that with regard to Mr. Lynam's paper, he would respectfully suggest that he had underdated the age of those camps. It appeared to him that they dated back hundreds of years before there was a Roman in this country. The hillsides in our own country were scored with those mounds, especially on the Wolds. He attributed them to the division of the country into small tribes, which were obliged to be continually on their defence. Those mounds were to some extent fortifications, and also places into which the cattle belonging to the tribe could be driven for security. He did not think they had regular stone walls. As

Mr. Lynam said, the rubble was in the main what was gathered from the diggings inside; they erected palisades where they could make them. He could not agree that those mounds were ever reared by Saxons or Romans or used by them. They could not find anything Roman or Saxon in them except it was something dropped by a wayfarer. If they found anything it was flint implements used by a very ancient people indeed.

THE KING'S MANOR, YORK.

THE ancient buildings known as the King's Manor, and now utilised as a school for the blind, were visited by the members of the British Archæological Association. Mr. A. Buckle, the superintendent, conducted them through the various courts and apartments and pointed out the various architectural and historical features of the building. Mr. Buckle has written a history of the manor, and the members were indebted to him for a very interesting paper on the same subject. In it Mr. Buckle stated that the palace of the Tudor and Stuart monarchs was originally the palace of the mitred abbot of St. Mary's—Abbot Sever or Sevyer, who died in 1502, and was the last who was supposed to have done anything to the building. Very little of his work now remained. When, in 1538, the abbey of St. Mary's was suppressed, the abbot's house was retained by the Crown, and remained in the possession of the Crown until purchased in 1838 by its present owners, the trustees of the Blind School. About the year 1538 the Council for the North was formed, and the King's Manor was, for the period with which he dealt, the official residence of the Lord-President and Council. There are still in existence three or four walls, or pieces of walls, which, according to the view of competent authorities, probably belonged to the time when the Council of the North was holding its sittings, whilst the handrail of the stone staircase on the south-west side of the building is doubtless *in situ* as in Abbot Sever's time. Recalling a visit paid to the palace by Henry VIII. and Queen Catherine in September 1541, Mr. Buckle said that it was in June of that year that the congregation of York were informed of the intended visit, and they agreed that "20*l.* should be laid out at London for the purchase of two cups of gold and silver of the best fashion to be presented to the King and Queen." Platforms were erected at Micklegate Bar, and on the 12th, "My Lord Mayor called certain joyners and painters and commanded immediately to take their counsel and devices together to make a show at Mickeleth Bar." It was resolved that a cup of gold, with 100*l.*, be presented to the King, and another cup, with 40*l.* therein, to the Queen's Grace for the worship of the city. The King, with twelve members of his Council and retinue, remained in York from September 15 to 26 waiting for the King of Scots, but no King came from the North to greet his uncle. Henry's Queen left him at York and went on to Pontefract Castle, and thence to London, where, when Henry arrived, a charge was brought against her which cost the poor Queen her head. One measure of the King's which dated from York all archæologists will regret. Many of the beautiful shrines in the churches of the north still remain undefaced, with their minute sculpture and fine goldsmith's work, creations of the highest artistic skill of the Middle Ages. On September 22 the King issued his commands to the archbishop to cause all these shrines in York to be taken down, and the places where they stood to be made even and plain. Thomas Radcliffe, the Earl of Sussex, was the first Lord President who expended anything on the repair of the Manor House. His successor, Henry Hastings, Earl of Huntingdon, made important additions to the palace, the greater part of the north-west portion being doubtless erected at this time. In one of the largest rooms are heraldic achievements connected with the earl. He seemed to have been in good favour with the citizens, for he preferred a request to the Corporation that North's postern might be enlarged so that his great horse might go through, with which request the Corporation at once complied. When James I. came to England to assume his crown he was received at the manor by the famous Thomas Cecil, Lord Burleigh, then Lord President. In 1616 a grant of 1,000*l.* was made by the Treasury for repairs to the manor, but in 1624 Lord Sheffield, who had succeeded to the Lord Presidency, rendered an account showing his expenditure to have been no less than 3,301*l.* 4*s.*, the greater part of which was doubtless spent in the erection of the block at the north side of the house. The latter is Jacobean in character, and the initials of King James are placed on the pilasters at the entrance. Lord Sheffield, too, seems to have been a favourite with the citizens. It was customary to present annually a butt of Gascoigne wine to the Lord President, and gifts were also sent to Lady Sheffield. These included two loaves of superfine sugar, weighing 12 lb. 14 oz., at 23*d.* per pound; thirty other loaves of ditto at the same price; a March payne, 13*s.* 4*d.*; 6 lbs. of comfits, 10*s.* 6*d.*; two boxes of marmalade, 5*s.*; Mayne bread, 2*s.* 6*d.*; one peck of pears, 2*s.*—total, 5*l.* 4*s.* 1*d.* On August 9, 1615, it was agreed "that the Lord Mayor, aldermen, sheriffs, twenty-four chamberlains and best commoners should meet the Lord Sheffield, Lord-Lieutenant and President in the north parts at Walmgate Bar to welcome his Honour to the city, who hath been to London, and since his last being at this city within the year had all his three sons drowned and daughter deceased." Coming to the most famous of the Lord Presidents, and to the most glorious part of the King's Manor, Mr. Buckle mentioned that Thomas Viscount Wentworth, the noted Earl of Strafford, was appointed Lord President in 1628, and for a great part of the first four years of his presidency resided at the King's Manor. The house owed the erection of the western and north-western part of the quadrangle to the ill-fated Strafford. His arms over the west door were those he bore as Viscount Wentworth, and were said to have formed one of the articles of his impeachment, in that he showed his ambition by quartering his arms over a royal palace. This interesting monument of one of the greatest men of that century is externally pretty much as he left it. Strafford's presidency lasted from 1628 to 1640, years during which he attained to the zenith of his power and honour, ending—after he had been hunted down by the relentless hatred of his political foes, and deserted by the master he had served so well—in the gloom of his execution. York had good reason to be thankful for a Lord President of such remarkable vigour of character, for it was during his presidency in 1631 that York suffered from the last visitation of the seventeenth-century plague, and by the prudent and strict regulations issued by Strafford, the Lord Mayor was much helped in his government at a trying time. The citizens of York, according to Mr. Davis, were fully sensible of their obligations to the Lord President. Towards the end of October, a short time before his departure from York, upon having received the appointment of Lord Deputy of Ireland, the Lord Mayor and his brethren were desirous of personally waiting upon Lord Wentworth to give him thanks for the many kindnesses he had shown the city. And they sent the sword-bearer to the manor to inquire when his lordship would be ready to receive them. It is not recorded that the interview took place, and most probably the compliment was declined. Not many days previously this remarkable man had been plunged into the deepest distress by the premature and sudden death of his wife, the Lady Arabella Wentworth, to whom he was devotedly attached. He remained in York but a short time after this event. It was during the presidency of Strafford, said Mr. Buckle, that the manor was used more as a palace than at any other time. In 1639 and 1640—which saw the gay and picturesque Court of Charles within its walls—the building, much as it was now externally, had, the reader of the paper thinks, reached the zenith of its glory as the palace of the Crown. Its fall and desuetude seemed to have been as rapid and as complete as the fall of the last President who lived within its walls, for in 1641 he laid his head on the block for his master. And in the same year that master, on his way to the north, spent two nights in York, not, however, as its palace, but at the house of Sir Arthur Ingham, and in 1642, during his long and last visit, he was indebted to the same worthy old knight for shelter and entertainment. The Council now being abolished, we found that in 1643 a Mr. John Stainforth was appointed "keeper of the house within the site of the late Monastery of the Blessed Mary, near the walls of the city of York, otherwise called the Pallas, or Manor House, or the Mannor Place, with a salary of 6*l.* 13*s.* 4*d.*" Verily, said Mr. Buckle, might we not write over the entrance, "Ichabod"—"The glory hath departed?" But 200 years afterwards (in 1838) we might pull down the inscription, for the Manor House once more became worthy of a palace, and again had a glory, not indeed derived from the presence of any monarch, however noble; another glory, but not less real—the memory of a famous Yorkshireman, William Wilberforce, by throwing light on the mental eyes of those who see not—

> The waving corn in autumn days,
> Nor witchery of the moon's pale rays,
> Nor morn's glad beams of rising sun,
> Nor roseate hues when day is done,

yet could find joy and gladness in the mental vision of beauties unseen by any physical eyes.

KILMALLOCK.

A CORRESPONDENT of the *Irish Times* gives the following account of the ancient town of Kilmallock, which was lately visited by the Royal Society of Antiquaries of Ireland:—

The town stands in the midst of the fertile plain on the road between Limerick and Cork. Though sixty years ago it exhibited, says a traveller, "the stillness of a sacked and desolate city," it is now a thriving and prosperous town, and evidently doing a good local trade, and the hotels were able to afford an excellent luncheon to the large party of archæologists that invaded

them so peacefully. The plan of the town was nearly cruciform, exhibiting two streets intersecting at right angles, the river Cammogue flowing past the end of one or two great picturesque ecclesiastical ruins standing on the banks of the stream. The town was anciently walled, with four castellated gateways at the entrance of the streets, and these are to some extent intact. These were strongly fortified, bearing some resemblance to Spanish architecture. The ruins are in far less good condition than at the beginning of the century, as they have been largely used as quarries for building purposes. Croker, in his day, said that "whenever a hovel is required to be built, the materials are procured by breaking down part of these once splendid mansions, some of which have been lowered and fitted up in accordance with the neglect and desertion of the place, and the interior of others is occupied by sheds for cattle or more loathsome pig-styes." Very few of the strong and massive mansions of the old burghers of Kilmallock now remain in comparative preservation. These were built of hewn stone on a uniform plan three storeys high, with embattlements and fine stone mouldings. The windows, mullions and chimneypieces were all finely carved in limestone, many of which exhibited great delicacy of finish and detail. They presented generally two or more gable ends to the street, the entrance being by fine semicircular arched portals, opening into small halls communicating with broad passages. One of the castellated mansions is said to have belonged to the Earl of Buckingham, and another where Sarsfield once resided. One with a wide, projecting roof was an ancient mint, and in modern times became the police barrack.

The castle stands within the town, and as the passage through it was too narrow the roadway has been diverted to the east. It is rectangular in form, 60 feet in height, and ascended by 73 steps. The guardroom is a blacksmith's forge, the room above being occupied, and the whole place is grim, sooty and dirty. A fine view, however, is obtained from the battlements. For this unsanitary abode a small weekly rent is exacted.

The wall runs almost without interruption the whole length of the south side of the town, and part of the east wall also remains. A monastery was said to have been founded here in the seventh century. The older of the ruins already mentioned belonged to the abbey dedicated to SS. Peter and Paul. It consists of a choir, a nave, a south transept, and side aisles and circular tower 50 feet high, with walls 5 feet thick. The choir is roofed and used as a parish church. The nave is divided by a range of four pointed arches, which spring from columns of plain masonwork. There are several sculptured monuments belonging to the Fitzgerald, Verdon and Blake families. The belfry rises to some height above the church, and is perforated by several pointed windows. The Dominican Abbey, on the opposite side of the river, and outside the town walls, is said to have been founded in 1291 by Gilbert, second son of John, Lord of Offaly. It is larger than the abbey church. The plan is cruciform, and the architecture is graceful and picturesque. It exhibits many specimens of exquisite design, equal to that of any other similar structure in Ireland. It presents a most striking view from the road—the soft grey walls toned by age, and crumbling through neglect and the touch of sacrilegious hands, the graceful, but ruined tower, the finely-moulded windows and the rich expanse of meadow stretching far beyond. The chancel is considered the earliest portion of the abbey. The east window is very beautiful, and has been restored by the Society, and consists of five lancets under a pointed arch. The south wall has six double lancets opening very widely inward. Underneath are the remains of sedilia, and on the opposite wall is a remarkable tomb-niche, finely carved with delicate pointed arch. It is suggested that Maurice, son of the founder and hero of Hallidon Hill, was buried here with his wife. Near at hand, on the floor of the abbey, is the tomb of the White Knight. His treachery to his kinsman, the Sugan Earl, son of the last Earl of Desmond, is well known. He secured his estates by submission to Elizabeth, and on the offer of 1,000*l.*, with pressure put on him for the Sugan Earl, he set out and captured him near Mitchelstown by treachery, and sent him to Cork, from whence he was sent to the Tower of London, where he died in 1608, and his betrayer died in the following year.

North of the chancel is a great hall, 90 feet by 18, likely the common-room of the community, and to the west is the refectory. The remains of a passage or chambers lie north of the cloister garth, and traces of cloisters on the east and south. The central tower is 90 feet high, resting on four lofty arches, one leading to a transept, with a fine window of five lights, with a beautiful series of geometrical pattern. It is built up to half height to preserve it. In a small chamber in the north side of the cloister garth is a "squint" about 8 feet long, through which a watcher saw that the altar lights were lit, or perhaps a sick brother to look towards it and hear service. The whole is in great want of preservation. The Society has spent 80*l.* in restoration, for the privilege of which they had to fee the owner. The ground is held under judicial lease, and the condition of the floors and immediate surroundings was exceedingly neglected and filthy. The floors were ankle deep in cow manure, the animals using the abbey as a shelter, and one of the beautiful small windows was recently broken down to rescue a calf that had thrust himself in. Much comment was passed on the neglected condition of the abbey, and the question pertinently asked, What are the societies in the kingdom to do in order to secure a measure that will put these splendid ruins and hundreds of others beyond the power of destruction by man or beast? Recognising to the fullest extent the rights of property, no one can defend the rights of owner or lessee to destroy and deface ancient monuments. This principle is recognised in Sir John Lubbock's Bill, but the measure, unfortunately, is a dead letter. What has been seen during the excursion has forced upon us the absolute necessity of such a measure as will preserve to us the stone treasures of ancient days by the protecting and sustaining powers of the State.

At the dissolution of the monasteries the Abbey was granted to the Corporation of Kilmallock, after which it gradually sank into ruin, until it is now, as Mr. Aubrey de Vere said of it, "the charnel of your desecrated fane." The town of Kilmallock is one of the most ancient of Ireland, being a walled town in the thirteenth century, and the Corporation dates from an early period. The charter, however, dates only from the 27th of Elizabeth. The Corporation consisted of a sovereign and burgesses. The property was at one time very extensive, but drifted into the hands of private individuals. It returned two members to Parliament before the Union, when it was disfranchised, and Oliver Gascoigne received 15,000*l.* compensation. The town was associated with many stirring events in the wars of the Earls of Desmond. It was practically refounded by the Fitzgeralds, and was long the chief scene of their power and splendour. Their possessions extended over nearly four counties of an area of over 570,000 acres, and hence the seat of their opulence must have been a place of great importance.

When Garret, the last Earl, was arrested and sent to London, his cousin, James Fitzmaurice, captured Kilmallock, and the "Annals of the Four Masters" tell how the town was taken and sacked, and three days occupied in pillaging, taking away vast treasures of goods, after which they set fire to the town, "so that Kilmallock became the receptacle and abode of wolves." It was rebuilt by Sir John Perrot, and soon Fitzmaurice was captured, and in the church of St. Peter and St. Paul the president of Munster, with sword to his breast, compelled him to swear allegiance to Elizabeth, and confess that "this earth of Kilmallock, which town I have most traitorously sacked and burnt, I kiss, and on the same lie prostrate, overfraught with sorrow." It was in that church that the Sugan Earl attended service, when, after being received with enthusiasm and joy the day previously, he "was mocked, cursed and spit upon" by the people, as the service conducted then was Protestant. The town figured in the Civil Wars of 1641 and suffered much, and from that date down its ancient walls, abbeys and buildings have crumbled into ruins, so that it may well be called "the Baalbec of Ireland."

It is worthy of note regarding the origin of White Knight, that on the field of Hallidon Hill three cousins of Desmond fought so well for Edward III., that after the battle he bound up the arm of one with a white scarf and knighted him on the field, and also the others, calling them Black Knight, Green Knight, and White Knight on account of their armour. The title of White Knight is extinct, but the Black Knight is represented by the Knight of Glin, and the Green by the Knight of Kerry.

ROSLIN CHAPEL.

ONE of the excursions in connection with the meeting of the Royal Archæological Institute of Edinburgh was to Roslin. Mr. Thomas Ross, architect, was the guide for the day, and the party visited first the chapel—the Collegiate Church of St. Matthew as it properly is—where Mr. Ross delivered a short lecture upon its leading features. Founded in the middle of the fifteenth century, the chapel was the pious work of the Earl of Orkney of the day, who built it "to the end he might not seem altogither unthankfull to God for the benefites he receaved from Him." He never lived, however, to see the end of his work. Only the choir was completed, and that after the founder's death. One can only guess what the completed edifice might have been from the beauty of what has come down to us. It should be unnecessary, even if it were possible, to describe this gem of architecture. The chapel, reckoned in the money value of our day, cost four hundred thousand pounds. When one remembers the way in which the chapel was built, that these were not the days of competitive plans or contract jobs, and that the pious builder "caused artificers to be brought from other regions and foreign kingdoms, and caused daily to be abundance of workmen of all kinds present;" and when one looks at the wonderful richness of the interior, which is encrusted with the most elaborate carving, it is easy to imagine that it may have cost a fabulous

amount. In the accounts for the chapel there appeared large sums for wood, whereas in the building itself there is not a scrap of wood except what has been recently introduced. The explanation was that William Lord Sinclair worked without plan, and that when a workman brought him a design, he was asked to furnish a full model of it in wood. What Mr. Ross principally confined his attention to was the peculiarities of architecture which distinguish the building. He drew attention to features of the design which reminded one of Glasgow Cathedral, and which were so marked that they could not be accidental. He expressed the view that the foundations of the nave had been laid, extending as far as 91 feet to the westward. He emphasised the peculiarity of the barrel roof of the choir, and he thought it might be doubted if it was the original intention to have that vault only, as all the collegiate churches known had a thick roof. The flying buttresses outside would also have led one to expect a groined roof. The explanation seemed to be this. There were two periods of church building in Scotland, separated by more than a century. The first, beginning about 1057 A.D., lasted two centuries. During that period Scottish architecture followed that of England. The second period, to which Roslin belonged, began in the fifteenth century and continued till the Reformation. During the interval between the periods Scottish builders were principally engaged in erecting castles of a modified Norman type, and they might be said to have lost touch with Gothic architecture. When they came to take it up again, it was not surprising to find many features common in the castles, such as the barrel vault, introduced in the chapels. Mr. Ross also drew attention to another feature of the chapel which he ascribed to this cause, namely, the vaulting of the north and south aisles. These vaults sprung from stone lintels laid across the aisles from the outside wall to the top of the pillars in the nave arcade, and this, Mr. Ross said, was a style which was not to be expected. It was not to be expected that the builders of Roslin were unacquainted with the groined roof, but they were simply following the examples of their own day. After Mr. Ross's explanation the party spent a good deal of time in examining the details of the chapel, and the incumbent, the Rev. Mr. Thomson, gave useful assistance in explaining the subjects of the carvings upon the pillars and upon the walls. One feature which struck and delighted many of the visitors was the wonderful richness of the colouring which age has given to the chapel, both within and without.

VALUES IN PAINTING.

WHEN an artist desires to imitate a scene containing unequally-distributed masses of light and shade, he is obliged to attribute to each of them its real value. He must therefore measure, or at least estimate, the brilliancy of different objects or of different surfaces, and graduate them in his copy according to the same proportional scale as in the model. For this purpose he possesses an eye more or less exercised, which, however, as in other men, is a powerless instrument for the exact comparison of luminous intensities. He is, moreover, obstructed by the imperfection of resources of the art of painting; for nature generally presents an absolute brilliancy that no colouring could imitate. Unable to make his picture as perfect as nature, he is forced to darken it; but, for accuracy, he should at least maintain harmony and proportion of lights—that is to say, weaken all the lights in the same proportion. On this condition alone will his representation be true and faithful. How far has this condition been fulfilled in the most celebrated pictures?—in other words, how far are the masterpieces of art true to nature? More fortunate than the painter, the optician, knowing the imperfections of the eye, has invented photometrical apparatus, by which he can compare the brilliancy of neighbouring objects and numerically express their relative illumination. By the aid of such apparatus, for instance, he ascertains that the shadow of a stick cast upon white paper has a twentieth of the brilliancy of the portions directly illuminated by the sun. One of these instruments is like a single-barrelled opera-glass. By putting the eye at the front we see that its interior is divided by a partition. On looking at an object through one of the compartments a neighbouring object can be seen through the other; and by turning the tube upon itself, the partition may be made to coincide with the line of separation of the two objects. Close to the eye the instrument carries a movable graduated circle. If, continuing to regard the two objects, we turn this circle, we remark that one becomes more distinct, while the other darkens. Soon the darker object becomes extremely black, while the other attains its maximum brilliancy. The graduation of the circle is so arranged as to show the difference in brilliancy of the two objects by the number of divisions which this circle has to be turned from the zero (found as above) until the objects appear in the field of view with an equal degree of brilliancy. To understand this better, conceive the shadow of a house cast on a white wall. Let us direct the telescope on the boundary line of the shadow; we see in one compartment the brilliant surface and in the other the shadow. Let us now turn the circle until the two parts acquire the same brilliancy, or until we see an equally illuminated surface. The divisions in the circle will then show that the mark which stood at zero at the commencement of our experiment has moved to 20, showing that the illuminated part of the wall is twenty times more brilliant than the shaded portion. Had the wall been yellow, blue or any other colour, we should have found the same result. Instead of the wall and the shadow of the house, we might consider the ground and the shadow of a tree, a sunbeam and a shadow cast anywhere, the lines of separation of light and shade in a landscape, of a building and the sky, of blue sky and a cloud, &c.—in every case we would have obtained numbers expressing the relative brilliancy of objects contiguous to the field of vision, provided always that the photometer be suitably modified not only according to the brilliancy, but the tints or colourings of the contiguous objects. Let us now suppose an artist to have reproduced in a landscape a wall with a shadow, a piece of ground with the shadow of a tree, &c., and let us try to investigate the truth of his representation. The operations are precisely similar to those already described when examining the relations of the objects themselves. M. Jamin, the inventor, states that after having submitted to the test of his photometer a great number of pictures, he has arrived at the unforeseen result that in almost all the proportional relations of the lights differ from those of nature. Always, or almost always, the shadows are not sufficiently deep; light and shade in pictures have also different colouring, so that the photometer, such as described, cannot, as in nature, render the apparent brilliancies of objects exactly equal. A twofold incorrectness is thus everywhere indicated, incorrect proportions of light, false imitations of tints. Had these deviations from nature been trifling painting might be admitted to be an approximate imitation of nature, but they are on the contrary very considerable. In the simple case of a body illuminated by the sun and a shadow cast upon it, the relations found in summer, winter, different hours of the day, fine and bad weather, have been extremely varied. In general the minimum value of the relation of light and shadow is 10, its maximum value 20. But when sunbeams in pictures are examined we find the above relations comprised between 2 and 4, so that the brilliancy of the sunlight is incomparably weaker in the pictures than in the true landscapes. It is difficult to conceive how the eye can tolerate such considerable inaccuracies. Still all landscape-painters do not deserve this reproach in the same degree; the modern school has made great progress towards exactness; everyone may remark that their pictures have deeper shadows and brighter lights; some pictures of Decamps, for instance, present luminous effects comprised within the limits assigned by nature. The discordance between nature and art in night pictures is not less remarkable. If in one of these pictures, usually lighted by a murky lamp, we compare the light of the lamp with the best illuminated parts we shall find a relation comprised between 20 and 30. By placing in a room a lighted candle and a sheet of white paper, the ratio of the light of the candle to that reflected from the paper will be found to be 1,500; the candle flame is thus 1,500 times as luminous as the paper, while in a picture it is made scarcely 30 times as luminous.

GENERAL.

Mr. W. H. Smith, the Lord Warden of the Cinque Ports, has accepted the office of President of Dover College, and of the Dover School of Art, posts which were held by the late Lord Granville.

Mr. J. O. Moynan, C.E., has been transferred from the County Longford, and appointed county surveyor for the North Riding of Tipperary, in place of the late Mr. A. H. Crawford, C.E.

Herr Carl Hilgers, the sculptor, who sent in one of the models for a National Monument to the late Emperor William of Germany, has been awarded a prize of 12,000 marks, in addition to the 4,000 marks assured to each of the competitors.

Appeals for the preservation of the tower of St. Mary's Church, Manchester, continue to be made, but the authorities are bent on removing it.

The Electric Lamps at the Frankfort Exhibition were lighted on Tuesday for the first time by the current transmitted from the generating centre at the Lauffin Falls, on the Neckar, 108 miles distant.

A Sum of 20,565*l.* has been derived from the Glasgow East End Industrial Exhibition. The expenses amounted to 17,000*l.*, and the balance has mainly been invested in city stock.

The Local Board of East Dereham have instructed their surveyor to prepare plans for the construction of a new cattle market.

The Architect.

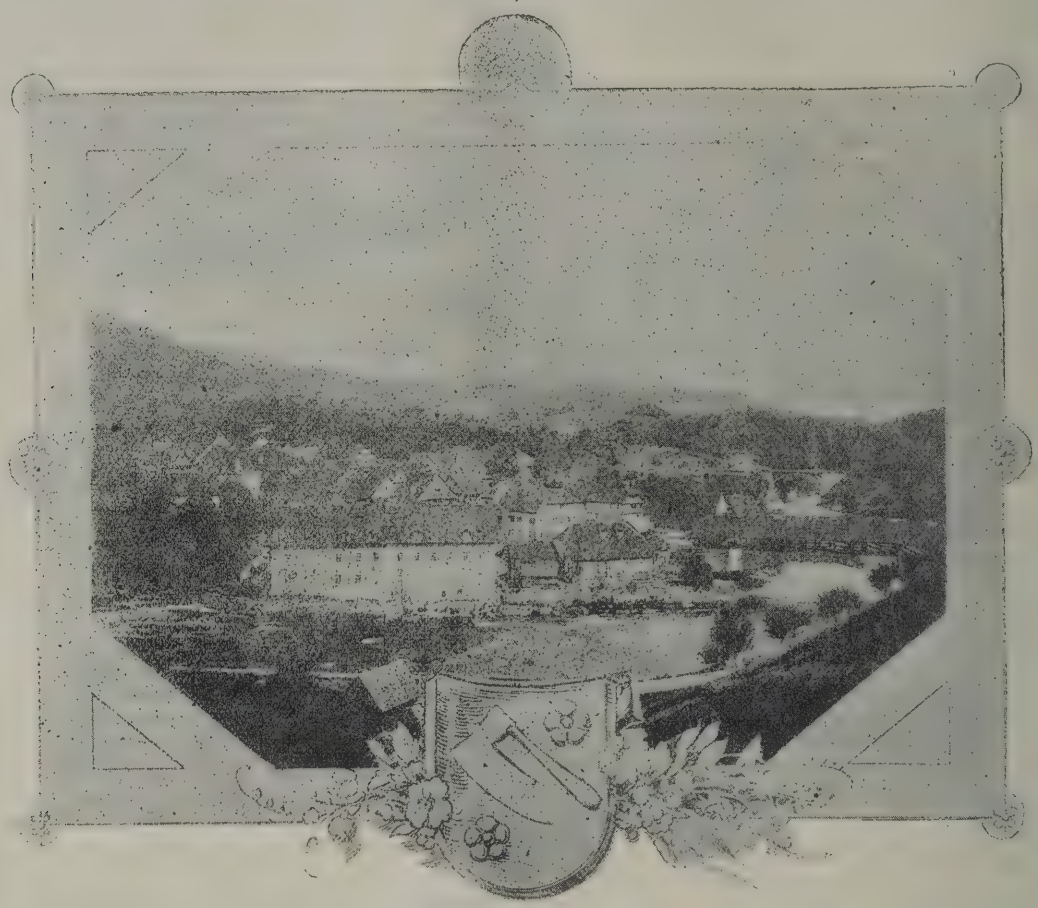
THE WEEK.

AT the meeting of the Manchester City Council on Wednesday, a memorial was read from the local Society of Architects, appealing for a postponement of the demolition of the tower of St. Mary's Church. It was said by the memorialists that "Although the tower itself is not possessed of much architectural beauty, yet it presents features of archæological interest, particularly in the curious combination of Gothic remains, possibly from some earlier building, with masonry of a later style. As a memorial of the past and a vantage-point for the prospect from its summit, it might, we venture to think, be allowed to stand. We would, at all events, strongly recommend that it remain untouched for, say, twelve months, when the question of facing up the east end and putting the whole in repair could then be entertained." The Mayor, in order to test the feeling of the Council, suggested that the Parks Committee should reconsider the subject. He declared that it was a mistake to have removed St. Mary's Church instead of St. Ann's Church, which would have allowed of the extension of the square. Alderman THOMPSON said the committee had visited the place on three occasions, and each time they concluded it was not worth preservation. The majority of the Council took the same view, and the efforts to save the tower were consequently ineffectual.

IT is understood that the sum of 120,000*l.* will be put down in the instructions to competitors as the limit of outlay for the construction of the proposed Art and Music Galleries which are to be erected in Kelvingrove Park, Glasgow. The buildings are to comprise a central hall, with an area of from 8,000 to 10,000 square feet, exhibition galleries, lecture theatre, museum, workshop and offices. The designs are to be sent in on a day to be named in November, and after examination there will be a second competition among the authors of the designs that appear most eligible. The site is excellent—a public park, with undulating grounds. Sir GILBERT SCOTT'S University buildings form part of the boundary on one side, and will be opposite the new building. The competition ought to bring forth many excellent designs.

STRIKES in France have to be brought to a victorious end without much delay, for "the sinews of war" are not very strong in the societies, and therefore the campaign must be brief. The excavators have discovered that they cannot hold out as easily as their English models, for their supplies are over modest. In twenty-three days all that could be distributed among the three thousand men on strike was a sum of 4,665 francs, which is far less than a penny a day. The average pay of excavators is 5 francs a day, so that the men on strike lost in twenty-three days 345,000 francs. It is a large price to pay for the luxury of annoying contractors, the majority of whom can bear a loss with equanimity.

A REMARKABLE paper was read by the versatile Mr. G. C. LELAND at the Congress of Orientalists on Wednesday. He is a student who follows some of the untrodden byways of archæology, and one of his discoveries does seem to be connected with some early forms of ornamentation. According to Mr. LELAND, a curious link connecting the East and West is to be found in the salagrama stone, which is to be found in India. It is about the size of an orange, and is a kind of ammonite having a hole in it. VISHNU the Preserver once, when pursued by SIVA the Destroyer, prayed to MAYA (illusion or glamour) to protect him. She changed him into a stone, through which the destroyer, as a worm, wound his way. Since that time this stone is worshipped. Mr. LELAND found that in the Toscana Romana, a district in Northern Italy, there are families of wizards among whom a vast amount of old Etruscan-Roman lore is preserved. Among other objects they worship or hold in great veneration a stone called salagrana. It is really stalagmite from caverns, but as it resembles the little mounds made by earthworms, the peasants believe it is really the same petrified. This faith that worms have made and passed through it, closely connects the salagrana with the salagrama. In the Norse mythology, ODIN as a worm once bored his way through a stone in order to get at "the mead of poetry." Hence all stones with holes in them are known as Odin stones, also as "holy stones," and are much used in the north as amulets. Hung at the bed's head they drive away nightmare. There seems here to be some connection with the salagrama. Mr. LELAND regarded it as possible that the interlace of Gothic decoration, but especially that of Celtic, Anglo-Saxon and Scandinavian art, was anciently made to avert the evil eye and bad luck. A recent traveller in Persia was told that the patterns on carpets in that country were made intricate so that the evil eye might be bewildered. Mr. LELAND said he had copied many hundreds, if not thousands, of Norse interlaces, and was persuaded that through them all ran this inspiration of a protecting power against sorcery. But Mr. LELAND'S theory is open to the objection that if interlaced ornament was so closely and openly associated with Pagan superstitions, why was it adopted by the early Christians in the West of Europe?



THE Birmingham Council having taken over the technical classes of the Midland Institute, the arrangements are completed for carrying them on in the way that will be most advantageous to the city. The classes will commence on the 14th inst. and will end on April 30, 1892. There are twenty-six teachers, some of them being experts. Care has been taken to make the instruction applicable to the principal industries of Birmingham. Hence most prominence has been given to the metal trades. The metallurgical laboratory is the largest in the country, having eighteen wind furnaces and seventeen muffle furnaces. Electric light is used. There are also a chemical laboratory, a physics laboratory an engineering laboratory, and one for electro-metallurgy; they are all enriched by the latest appliances. The classes will be of two kinds, elementary and advanced. Care has been taken in the grouping so that several connected courses can be attended by students of a trade. The fees can be described as nominal. For a single class the charge will be 2*s.* 6*d.*, or 5*s.* for a session, and a connected course can be gone through for 10*s.* per session. A charge of 2*s.* 6*d.* is made for the use of apparatus. Birmingham has suffered grievously through the influence of the Science and Art Department. The citizens are now endeavouring to recover the trade which was lost owing to the meddling of officials that were amateurs. As one means, industrial design is being properly taught throughout the city, and as a like energy will be displayed in the municipal technical schools they are sure to be no less successful.

OF late years catalogues of private collections have appeared which are among the most prized volumes of collectors. But one which is being prepared by MM. EMILE PICOT and GERMAIN BAPST for the Duc D'AUMALE is likely to surpass all its predecessors. The collections belonging to the Prince in the Château de Chantilly, and which are to become the property of the French Academy, are of the highest importance. The objects were not brought together, as is often the case, as evidence of wealth. Those which were not inherited were obtained by the Duc D'AUMALE because of his love of art and literature. They represent the researches which have solaced long years of exile and suffering. The books have great interest from their rarity or from their association with historic celebrities. The works of art will make the galleries be sought out by many a student. Pictures by Italian, Dutch, Spanish, French and English masters are to be seen there, and each is a masterpiece. Then there are examples of sculpture, furniture, metalwork, tapestry, stained-glass, armour, jewellery, porcelain. Among the numerous collections there is not one object which is not worth an illustration, and it would require a fortune to prepare a description worthy of so unique a treasure-house. The value of the estate is said to be eighty millions of francs, and it is a princely gift to France. When a mortgage is paid off, which will be in 1934, the Academy will be able to derive a revenue of 600,000 francs out of Chantilly.

ARCHITECTURAL PROGRESS IN THE BLACK FOREST.

By J. RUSSELL ENDEAN.

A FEW weeks ago we made some excursions in the Black Forest of Germany; and he who loves to see Nature in some of her most beautiful aspects will find few parts of Europe where he can more completely enjoy himself than here, where rocks and hills, mountains, woods and rivers are presented to his view in all their manifold varieties of form and tint, and light and shade, where are the pine forests in which numberless pine-trees rise straight upwards from their roots to a height of from 150 feet to 200 feet, with many examples of other kinds of trees measuring 6 feet and more in diameter. The course of our wanderings led us to Forbach, distant about twelve miles from Baden-Baden, with a distinctly rural population of about 1,400 persons, and situated in the heart of this part of the Black Forest.

VIEW OF FORBACH.

And here interest was at once excited, for every household seemed actively occupied, indoors or out, in decorating the town. Very beautiful triumphal arches were raised at various points of vantage, whilst in the streets and running for about two miles outside of the town fir-trees were planted, about 6 feet apart, on both sides of the roadway. Flags, banners, and floral decorations were abundant, and far more highly educated populations might here have taken lessons with advantage in the art of municipal festive decorations.

And all this popular enthusiasm was raised on account of the opening of the new parish church, which was all but complete, and the people were fully justified in the spirit they exhibited. We have seen numberless churches in most of the states of Europe, but seldom have we looked upon one that, for general beauty of design, for fineness of proportions, for bold but most chaste decorative effects in tone and tint, made a deeper impression than this charming building, the new Roman Catholic church at Forbach, in the Murgthal.

It was commenced in 1886, and has been over four years in building. It was designed by Herr ADOLF WILLIARD, the consulting architect to the Archiepiscopal Buildings' Administration, Carlsruhe, and has been completed under his immediate superintendence. It is in the style of the Rhenish-Romanesque transition period of the thirteenth century, is basilican in form, with an aisle on each side of the central nave, a chancel with side aisles, an entrance vestibule in three sections flanked by two towers, and the whole is built of sandstone blocks, the blocks having been found lying scattered in the surrounding mountain forests. Standing on a very commanding position overlooking the town, the church is confronted at a little distance by lofty mountains, and from the terrace in front of it an extensive panorama lies before the visitor. For ages past a church has stood on the site of the new building; the late church was built in 1788, but eventually it became too small for the necessities of the population.

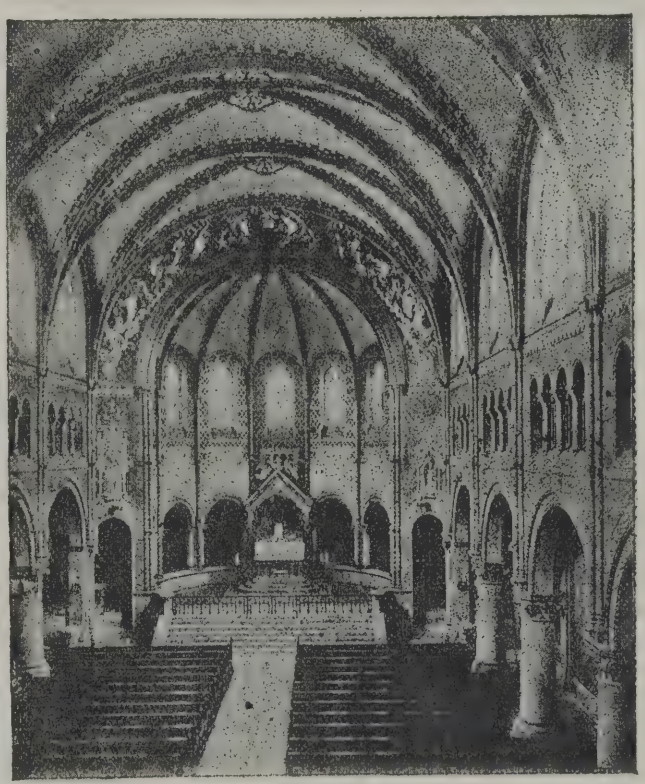
EXTERIOR OF CHURCH.

The sacristy (chapel-like) is built at the back of the apse. The total length of the church is 180 feet by 70 feet 6 inches wide at the nave; 80 feet 6 inches is its greatest width. The height externally to the top of the roof is

87 feet, and the height of the towers to the floral cross 167 feet 6 inches. The interior is divided into a broad central aisle 54 feet wide, flanked by two narrow corridor-like side-aisles each 7 feet wide. In the nave, seats are provided for 800 persons, the aisles being without seats.

VIEW SHOWING SACRISTY.

The organ-loft is placed over the vestibule above the principal entrance. In the nave there are seven arches of 17 feet span; from the pavement to apex of the vault, these rise to 60 feet in the centre aisle, and to 24 feet 2 inches in the side aisles; the triforia galleries above the latter are



INTERIOR, SHOWING ORGAN LOFT.

open to the middle aisles through a series of four arches on each side, and these are supported by pillars and dwarf columns; as they are lighted only indirectly from the nave they stand out dark against the bright walls of the centre aisle, and the effect thereby produced is most agreeable.

The galleries seat about 300 persons. By means of arches within them the lateral pressure of the roof of the nave is transferred to the buttresses. The organ-gallery, with the principal entrance underneath it, and the doors, are architecturally rich in detail; there are two side-niches for the "confessionals"; over these are the chambers for the use of the bell-ringers during the service, whilst over these again, and in front of the organ, is a gallery (projecting like a balcony) for the singers.

On a platform ascended by seven steps and narrowed by the form of the central arch to a width of about 34 feet, the choir forms seven sides of a regular dodecagon. In front of the central side of the apse is the high altar, and this embraces the architecture of the interior in a perspective vanishing-point of all lines in the form of a ciborium altar, surmounted by a canopy, crowned with a cross. The wall at the back of the altar is decorated with an admirable painting of "The Baptism in Jordan," in honour of St. JOHN THE BAPTIST, the patron saint of the church; the tabernacle, in bronze relief, represents "CHRIST as the Judge of the World;" the back of the candlestick-shelf is in the

INTERIOR, SHOWING CHOIR.

form of shallow niches divided by small columns, and in these niches the Twelve Apostles are painted in miniature; the crucifix and candlesticks complete the furniture of the altar-table, and this stands on columns of stone.

The treatment of windows and walls is in strong-coloured tones in keeping with the style. The central window in the apse represents "CHRIST in Glory," surrounded by the symbols of the four Evangelists, whilst in the other windows are represented, under baldacchini, SS. PETER and PAUL, and the four great fathers of the Latin Church, St. AUGUSTIN, St. AMBROSE, St. GREGORY and St. JEROME.

The side-aisles, with the side-altars, are also supplied with pictures which relate to the VIRGIN MARY and St. WENDELIN, in rich massive frames; the windows of the lady chapel represent St. JOSEPH, St. ANNE and St. JAMES; whilst the windows in St. Wendelin's Chapel depict three saints of the district who enjoy local veneration from ancient times.

The twelve round windows in the side aisles of the nave and the transverse walls of the towers are decorated with glass and wall-paintings respectively, in medallion form, representing the "Stations of the Cross," and these, in conjunction with the great "rose-window" over the organ, shed a warm-toned but very subdued and cheerful light upon the polychromatic painted details of the interior, whilst the sunk windows of the nave, high up and removed from the sight of the congregation, filled with panes of clear bot tle-

glass with coloured borders, fully and strongly illuminate the vaulting of the roof, which roof is enlivened by the ribs being painted in some parts and the plain surfaces being richly decorated; the whole effect of the roof conformation is particularly light and cheerful, in spite of the wide span of the arch.

The colouring of the interior was controlled by the flesh-tint of the sandstone, which, in shade and tone, formed the base of the colour-effect aimed at by the architect, the altar-tables (of white Murgthal sandstone) and all the principal architectural details with special accentuation of the bases, capitals and archivolts, &c., are painted architecturally.

Figure decoration, in the form of paintings on the walls, has been executed as follows:—On the oblique front of the chancel-arch, in the arch itself, "The Holy Trinity and the Heavenly Powers" are drawn; whilst on the shafts of the arch are votive pictures of "The Heart of JESUS" and "The Heart of MARY"; on the arch over the portal an "Annunciation"; in the lunette over the entrance in the vestibule, "CHRIST inviting the weary and heavy laden." In the tympan in the vestibule is a relief of "The VIRGIN MARY and Child," whilst on the consoles the figures of SS. PETER and PAUL will stand. The six wall-surfaces in the choir are now waiting for the artist to complete his work.

The large and handsome crucifix suspended from the arch of the choir was carved by J. EBERLE, of Ueberlingen. In decorated wood-carving are the figures of the four evangelists in the pulpit. The organ (ornamented with a statue in wood of St. CECILIA by the sculptor DIETSCHE) contains thirty stops, and was made by Messrs. VOIT & SONS, of Durlach, at a cost of 850*l.*, and is a very fine instrument. The bronze relief on the high altar was designed by the architect, Herr WILLIARD, and was made by Herr FÜRSTEIN, in Freiburg, at a cost of 300*l.*; the figure wall-paintings were executed by Herr KONRAD SCHMIDER, of Carlsruhe; the paintings on glass by Herr H. BEILER, of Heidelberg; the carpentry and the wrought-iron work were executed by the workmen of Forbach and the Lower Murgthal.

The cost of the building (independent of the cost of the organ, the clock, the bells and the high altar) amounts to 16,500*l.*, the total of the cost being from 18,000*l.* to 20,000*l.* Had the funds permitted, the church would have been one-tenth larger in all dimensions of length, height and breadth; but it speaks marvellously well for so small a community that no obstacle was raised to the expenditure of so large a sum for their church—a church that does honour architecturally to the age in which it is raised, and to the people who so freely contributed from the means at their command to possess so beautiful a structure as this which now adorns their little town. The church has since been duly consecrated, amidst great rejoicings, by His Grace the Archbishop of Freiburg (Dr. JOHN CHRISTIAN ROOS), in the Duchy of Baden.

THE SOCIETY OF ARCHITECTS' EXCURSION TO BELGIUM.

(*Concluded from page* 124.)

AUDENARDE is like Tournai, in that it has one central feature; but here it is the Hôtel de Ville, better designed and better placed even than that of Tournai, with its weather-stained, beautifully-toned old Gothic front, in two flanks, to a central crown-capped tower, facing the Grande Place. Here the Bourgmestre and his senior Echevin received the members of the Society of Architects on Wednesday morning in most hospitable fashion, making them feel at home to sketch and photograph to such extent as they might wish, and most of them were soon busy with their pencils, particularly aiming at obtaining details of the grand Renaissance door (1537) to the council chamber, of which there is a cast at the Crystal Palace, though no cast could give the crispness of the actual work. Later in the day the churches of the town were inspected, Notre Dame, recently restored, being charming in its grey tone and early Gothic detail, and St. Walburga as hideous in the nineteenth-century Renaissance plaster-work—as bad as bad can be—which hides the Romanesque beneath, soon, it is to be hoped, to be revealed again and properly restored. A view up the river must not be forgotten: it revealed the remarkably simple drainage system of the town, the privies overhanging the stream.

Courtrai possesses only one little thing of really great architectural value, and that is the chimneypiece to the Hôtel de Ville, as fine a specimen of Gothic carving in stone as the council-chamber door at Audenarde is of the wood-carver's art, and situated in a room most harmoniously coloured, with modern frescoes on the walls by GUFFENS, SWERTS and JANESENS, the most remarkable being the *Crusader's Departure*, which has been reproduced in *The Architect*. Fortunately, Thursday was brilliantly fine, so that the rich colour of the old brick and plaster-work of the older houses of Courtrai could be appreciated thoroughly, especially those in the convent, or Béguinage, of St. Elizabeth. The pyramidal-roofed towers of the old water-gate, and the red brick tower of the old hall, with its central spire and four corner ones, also claimed deserved attention; but many members spent a great part of the day in purchasing lace as presents for their friends—a sure sign that the tour was coming to an end.

Seeking in Ypres, the last town visited, for a characteristic feature, it is readily discerned in its bold and massive towers and its beautiful street vistas, greatly helped by the streets converging to the Place, and to the position of the Cathedral and the huge Cloth Hall, the latter facing the Place, and being sufficiently low in elevation to allow of the former being seen above it. Neither though are of exceptional architectural merit, though the great room of the Cloth Hall contains some excellent modern frescoes by M. PAUWELS, and has a roof with curious and somewhat weak construction at the angles, a central storey-post being used to support the angle tie-beam; and the seventeenth-century light choir-stalls in the Cathedral are worthy of a passing word. Friday, when Ypres was visited, was again a day of brilliant sunshine, and the colour effects of the old streets and houses were most exquisite in their quiet tone.

Thus the excursion ended, and the excursionists turned towards home, pleased with all that they had seen and the hospitable reception they had met with everywhere, but convinced that in sanitary matters the Belgians have yet much to learn, and might with much advantage come to England for their lesson.

ART EMBROIDERY IN JAPAN.

TO the great goddess Kwannon herself, writes a correspondent of the *Manchester Guardian*, the goddess of beneficence and beauty, the Japanese ascribe the invention of the art of embroidery. But—alas, for the pleasant myths of nations!—the severe studies of history and anthropology brush them ruthlessly aside and expose the naked truth. According to the views of the Japanese, Japan was the first of all created countries; how and when the rest of the world was created does not concern them, so long as they feel assured that the land of the Rising Sun was the first-born of the gods. But notwithstanding this boasted antiquity, there are irrefutable proofs that Japan is a juvenile in age compared with China, and that she derived embroidery, as she did her Buddhist religion, her language and civilisation, from this ancient mother of Oriental arts. In the art, however, of embroidery, as in some others, notably in lacquer and painting, the pupil has outstripped her teacher. Chinese embroidery remains the same as it has been for centuries—fine in workmanship, but formal and traditional in design, and to European eyes often crude and violent in colour. The same industry has become in the hands of the Japanese a living art, realising, sometimes even more than painting, the love of the Japanese for tender colour, subtle harmonies of tone, and poetic representations of nature in her joyous moods. The embroiderer is in Japan no servile copyist, but an artist, using, as we shall see, his needle and a few reels of raw silk as his brush and paints. Among the many charming customs of Japan is the kindly one of presenting gifts on all possible occasions. The gift is not, however, as is often the case with us, wrapped in brown paper and sent by parcel post, nor even, as in Paris, enclosed in delicately perfumed paper and tied with a silver cord; but it is usual to present it with a few graceful words, folded in an embroidered cloth or fukusa. A fukusa is generally from two to three feet square, made of the finest satin or crape, and embroidered with all the skill and art which the Japanese know so well how to exercise. Among the fukusas of the eighteenth century will be found some of the greatest triumphs of the embroiderer's art.

All subjects serve as motives; the figures of women, priests and the domestic gods—in the robes of which the appearances of different textures and materials are rendered by an ingenious variety of stitches with which European embroiderers of all times have been quite unacquainted—as well as flowers, birds, landscapes and still life. Embroidery is often aided by painting or printing of the foundation material, and some of the most delightful effects are produced by an undiscoverable blending of the printer's, painter's, embroiderer's and dyer's arts. As the stitches of the Japanese embroiderer are a delight to the European worker, so the varying tints of his threads are a puzzle. M. Gonse, in "L'Art Japonais," says that "a special vocabulary is required to describe them. The terms Turkey red, apple green, bottle green, lemon yellow, dead-leaf colour, sky blue, cream white, silver grey, fire red, reddish purple, with all the new names invented by our modistes will be insufficient. There are tints which only belong to fukusas, of which our European dyers have never known." And how is this? Because the Japanese embroiderer—true artist as he is—produces the tint he requires at the moment, and of the tone and combination he needs to realise the effect of nature, just as a painter, taking plain blue and red from his colour-box, combines them by his art in such a way as to give all the varying hues of the sunset sky. The method by which this is done I will describe later. Fukusas have found their way to Europe, where they but too often meet with Gothic treatment, being turned into cushions and chair backs, to suffer speedy deterioration in our smoky cities, or to be snipped into pin-cushions and curtain bands. Eighteenth-century fukusas are worthy of better treatment, for Japan will never again produce the embroideries of the golden age of feudalism.

A Japanese house is full of emptiness, for the Japanese have learnt the art of doing without. The floor spotlessly clean, and covered with smooth padded matting, serves for chair, table and bed; the wooden chopsticks dispense with knives, forks and spoons, and the hibachi of hot charcoal is the substitute for fireplace, poker and tongs. As the women wear no petticoats, bonnets, hats, gloves, boots, shoes and stockings, nor jewellery, great wardrobes and chests of drawers for clothes are unnecessary, and as household and personal linen are not used, presses are not required. Thus a Japanese household is so arranged as not to need the services of the laundress, the chimney-sweep, the knife and plate-cleaner, the shoemaker, the bonnet-maker, the glover, and, I should add, the window-cleaner, for the outer walls and the partitions between the rooms of a Japanese house are made of panels which slide over one another, and are filled with translucent paper which admits light, and thus takes the place of glass windows. One of the dainty cabinets which we are accustomed to treat in England as ornamental toys, and a small writing-table about 8 inches from the ground, are often the only articles of furniture in the room of the house of a wealthy owner. In a cupboard or double wall are thrown during the day the futons, or padded coverlets, which serve both as mattresses and bedclothes at night. In every room is found the tokonoma, or sacred recess, decorated even in the poorest houses with a vase containing a flower, and a kakemono or hanging picture, giving an impressionist sketch in black and white of a misty mountain or waving bamboo branches. In the tokonoma of the house of a wealthy person are hung the finest paintings, and here is also placed a gem or two from his art treasures, taken from his fireproof godown and changed from month to month. In a Japanese room there is neither privacy nor comfort, and hence the screen becomes a necessity, both to give shelter from the draughts which traverse the room from all sides, and some protection from the eyes of the curious. "To decorate construction, and not to construct decoration," has always been an axiom to the Japanese, as it must be to an art-loving people, and hence screen decoration has been an art to which the greatest painters—Korin, Tanyu and Hokusai—did not hesitate to devote their talents, and screen decoration is still the subject to which the highest efforts of the art-embroiderers are directed. There are screens and screens. The cranes and peacocks worked in high relief in gold paper-thread on coloured satins, which are so well known in England, and which are transported 12,000 miles, and sold at such surprisingly low figures as fine specimens of Japanese work, give not the slightest idea of the high level to which the art decoration of screens is carried here in Japan. To see what can be accomplished in this direction, visits should be paid to Mr. Nishimura's at Kioto, and to Mr. Shobe's at Yokohama and Tokio.

The gardens at the foot of the hill on which stand the temple of Chiomin and the great bronze bell, which was founded 800 years ago, were powdered over with the white blossoms of the cherry trees on the sunny day that we set out to see the work and workshops of Mr. Nishimura. Loitering seemed pleasanter that day than inquiring, and to watch the pretty figures of the Japanese girls come in groups of twos and threes up the hill, chattering and laughing under the shadow of their many-coloured paper sunshades, and take their places on one of the red-covered low tables under the trees and commence the serio-comic business of picnicing was more attractive than to be dragged in a jinrikisha to a distant part of the town to learn something of the art which gives beauty to the draperies of Japanese women and elegance to Japanese homes. But I left the gardens, the blossoming trees, the family picnic parties and the bewitching children—the most fascinating of subjects for the sketch-book—and went to Mr. Nishimura's to see his far-famed embroideries, for which he was awarded the Grand Prix at the Paris Exhibition. I was more than repaid for so doing. Art-work such as this deserves a visit, and I went more than once to obtain permanent impressions of productions so charming. The finest work is shown in a large showroom which opens by sliding panels on to a Japanese garden, and which, I afterwards found, gave several *motifs* for embroidery. Through this little garden meanders a shallow stream crossed by a stone bridge; on one side stands a grey stone lantern, which is supposed to light the soul on its annual visits home, and, half hidden by blossoming trees, is the cottage where the silent and solemn rite of the tea ceremony is performed. Of the many beautiful and quite wonderful specimens of work collected in this room I can give no adequate description. I will, however, try to sketch three pieces which were, to my mind, masterpieces of either skill or art, sometimes of both. The first is a six-fold screen representing a Japanese interior. In the first panel is embroidered in high relief a ball-like bouquet of flowers tied with ribbons, and represented as hanging against a wall, together with an open fan and a panel of wood. The next two panels represent the tokonoma; above is a frieze of painted velvet depicting a flight of swallows; below, resting on the raised shelf, is a silver and encrusted incense-burner and a gold lac tortoise; and, as if on the floor, stands a lacquer tobacco-box, all which objects are realistically embroidered to the point of deception. A screen in cut velvet of butterflies and flowers completes these panels. The fourth panel represents a bronze vase containing irises and supported on a carved wood table. The two last panels are the *tour de force*. They represent the paper wall panels of a room, one of which is pushed aside to allow of a peep into the moonlit garden beyond. Through the paper walls, which are here rendered by translucent white silk, are seen the ghosts of bamboo branches flickering in the moonlight, and last of all is seen the moon herself surrounded by clouds, and palely lighting branches of cherry-blossom which fall over the cold grey temple lamp, in which a dim light burns. This last panel is in painted crape. To obtain the effects required it will thus be seen that the arts of the painter, the printer and the embroiderer have all been enlisted, and are combined in a way which would occur to no one but a Japanese. The cool, tender tints of the moonlit garden contrast delightfully with the gorgeously-embroidered objects of the suggested interior of the room. The screen is altogether a charming example of Japanese ingenuity and Japanese conceits, and costs the moderate sum of 37*l*. The second piece I would mention is a low fourfold screen, about 2 feet high, representing the four seasons. Winter is suggested by the silvery moon lighting up the snowy ground and the bare trees; autumn, by the ruddy maple and a flight of swallows against a sunset sky; summer, by a tree-peony, with its ample flowers, leaning over a pond of water-lilies, and across the reeds is flying a solitary stork; and spring, by blossoming branches of the cherry-tree on a powdered gold ground. But these scenes are given with the rare skill of the impressionist; nothing is actually painted or embroidered, but everything is suggested, and the way in which tender touches of paint and silk embroidery and powderings of gold and silver are used, and gold thread inserted in the place of the threads of the fabric withdrawn, in order to produce these poetic little pictures, is simply exquisite. Mr. Nishimura considers his masterpiece to be a small screen, the perfection and high excellence of the work of which are, as in all the best Japanese art, not at once apparent on the face of it, except to the initiated and the connoisseur. It is a small four-panelled screen; on each panel is embroidered a single spray of a simple flower, but this flower is worked with consummate skill and delicacy and fidelity to nature. On one panel a single spray of begonia is given, in which the very pores and hairs of the green leaves are reproduced with the needle. Large and elaborate landscapes of trees and rivers and mountains were also to be seen, and so closely did they reproduce the painter's art that it was only on approaching near and on observing that the picture was worked with silk much finer than a hair, that one was convinced that one was not looking upon a painted picture.

Mr. Nishimura then did his best to lay bare his machinery, to reveal to me how it is all done, and how these wonders of embroidery, painting and dyeing are produced. He conducted me to the sheds where the stencil printing, the painting and the dyeing of the stuffs are executed, and thence to the embroidery-room, where, seated on the floor in a large, well-lit room were a number of men and boys leaning over their frames at work. Here a large landscape piece is in hand; it will take a year and a half to complete, and it will cost 950 dols. (nearly 150*l*.). The selection of the shades and tones

is left to the worker, who must be of the most expert. There four men are at work at a peacock with spread tail, and it is interesting to see—as one sees also in every embroidery school and workshop in Japan—the workman select the strands of colour from the reels of dyed silks lying on the frame, and attaching them, together with gold thread, to a hook inserted into the wooden frame, he twists them between the palms of his hands into the iridescent thread required. These are made fine or coarse as needed. The latter are laid on, or couched. Often the natural object which it is sought to reproduce is placed before the embroiderer, and he combines his silks into threads to get as near the original as possible. Thus I have seen a girl embroidering a peacock's tail place a real peacock's feather on the frame before her, she blending her blues and greens and golds in every needleful of thread in the earnest effort to rival the subtle glories of the original; and in Mr. Nishimura's workshop a pheasant and a hawk were to be seen hanging from the beam of the room, to give the workers suggestions of tones and harmonies of colour. Now we see why it is M. Gonse could find no terms to express the colourings of the Japanese embroideries, and why Europeans often make such vain searches to purchase the threads used by the Japanese in their work. They are, indeed, no more describable or purchaseable than the rainbow tints of Burne-Jones's palette, for they are made by the artist workman out of the blues and reds and yellows we all have to hand. In order to enable Japanese embroiderers to use silk freely in combinations desired, embroidery silks are simply dyed and reeled, and are not twisted. Art embroidery seems to be better paid than any other industry in Japan. There are said to be seven embroiderers in Kioto, whose services are in such great request that they can command the high wages of 5 dols. (16*s.* 8*d.*) a day. It is not unusual for a good embroiderer to earn 1 dol. (3*s.* 4*d.*) a day. Women earn from 6*d.* to 8*d.* a day for coarse work, of which there is an immense manufacture for export. Shobe's embroideries at Yokohama are quite unlike those of Nishimura in style and treatment. His successes are obtained in mignon lamp screens, on which are embroidered birds, butterflies, reeds, &c., with extraordinary tenderness of tone and restraint of colour. Three crows on a branch—a favourite Japanese motive for all kinds of decoration—is very cleverly rendered, the shading of the blacks being given by the lustre of the threads, which are laid in different directions. Most of the work is done at a little factory at Tokio, which I visited, and which I recollect as one of the pleasantest workshops I have seen in this pleasant land. Here the little apprentice girls were found busily at work. Seated on their heels at their frames, neatly dressed in blue kimonos and coloured obis, and with their abundant black hair perfectly dressed in bows and chignons, with flowers and gilt pins coquettishly stuck in on one side, they were so busily at work that they did not notice they were being sketched. In another room fine work was being done by men. Among many charming subjects I must mention that of a fish under water. The fish was first exquisitely embroidered and then partially concealed by pale blue silk threads, which were drawn across it and fastened firmly down. A water plant floating on the sheeny surface perfected the illusion. Such a subject, and so treated, is typical of the best taste of the Japanese. They admire the art most in which the workman's skill is concealed by the perfection of the result, and those motives which by their delicacy and modesty require the cultivated taste of the connoisseur to appreciate. The vulgar, flashy pieces of embroidery are made for Europe and America, and are never seen in a Japanese house. The light, airy rooms, the healthful conditions under which the people work, and their happy, intelligent faces were noticeable at Shobe's, as in many other workshops I visited. Wages are in this factory paid by the day, and for skilled work amount to 1*s.* 8*d.* and 1*s.* 10*d.* a day, exclusive of meals, which are provided.

CASHEL AND HOLYCROSS.

THE successful excursion of the Royal Society of Antiquaries of Ireland came to an end with visits to the Rock of Cashel and Holycross Abbey. A correspondent of the *Irish Times* gives the following account of the ruins :—

On arriving in Cashel we were met by Mr. J. Davis White, local hon. secretary of the Society, and author of several interesting works on the antiquities and history of his native county. He conducted us over the ruins and explained at length the various objects of interest that met our view at every turn. The ruins, from their variety, their number, their artistic proportions and the grandeur of their site, form by far the noblest and most interesting collection in the kingdom. In no other spot, as has been well said, is there gathered together "such a magnificent display of every variety of ecclesiastical architecture, round and square towers, stone roofs, crypts and shrines, Saxon, Roman and Norman, all in one common ruin, as the Rock of Cashel displays to view." The spot, as is well known, is most intimately associated with the history and deeds of a line of Irish princes, and figures largely in the popular mind and monastic history and tradition as a place of sanctity from a very remote period. The first object that meets the view is a curious stone elevation upon a rock. On one side is a figure of the Crucifixion, and on the other a figure of St. Patrick. Curious traditions are associated with it, such as that the petty kings of Munster there paid tribute, that putting the head under the south-east corner cured the toothache, and others. The object, however, of supreme importance is the chapel of King Cormac. Much controversy still exists as to the date of its foundation. There were two Cormacs, one MacCullenan (*d.* 908) and the other MacCarthy, who is said to have built it in 1134. It is highly probable, and is generally accepted, for reasons not necessary to enter into, that he was the founder. It consists of nave and chancel, not constructed on the same axis, the supposed cause being that, as the church represented the body of Christ, it was so built because the body leaned to one side when hung upon the Cross. It has no east window, and no original west door, but doors on the north and south sides. Two towers spring from each side of the end of the nave to heights of 50 and 55 feet. The chapel measures 50 feet by 18, and is 52 feet high to the roof, which is built entirely of stone. The north door is richly decorated with zigzag and bead ornamentation, corresponding with the work at Kilmalkeader and Clonkeen, surmounted by a rude sculpture representing a centaur shooting a lion. The centaur wears a helmet with nasal bar, similar to those of the Normans in the Bayeaux tapestry. The doorway consists of five concentric arches, supported by five pillars and a double pillar. A rich arch ornamented with grotesque heads separates the nave and chancel, and in the southern tower is a staircase leading to small apartments above. One contains a fireplace, with flues penetrating the walls and no chimney. The walls of the choir and nave are relieved by a series of blank arches, but the whole structure is so dim that the rich details are not well revealed, and the walls and ceiling are much blackened by damp. A recess in the north wall, the supposed tomb of Cormac, with twelfth-century work, was opened some years ago, and a fine crozier, now in the collection of the Royal Irish Academy, was found within. On the south side, at the junction of the nave and choir, stands a square tower 68 feet in height. The "font," which is said to be really a tomb, was removed by the Board of Works from the little chapel off the northern transept, and placed at the west end of the nave. The font is beautifully interlaced, and the top or covering stone, which was also sculptured, was taken down and used as a common gravestone.

Near the east angle of the north aisle of the cathedral rises the round tower of splendid proportions, 56 feet in circumference and 90 feet high. The doorway is 11 feet high, and the tower is perfect, having the conical cap. The cathedral consists of choir, nave and transepts, and square tower of vast dimensions springing from four arches 25 feet in width. The building measures 210 feet by 170 feet, and is of pure Early English, such as we get at Lincoln and Salisbury. It has two chapels off the south transept, no side aisles or western doorway, the entrances being from the north and south sides of the west window. The building was much damaged when taken by assault, and the supposed spot is shown where the Rev. Redmund Barry, Prior of the Dominicans, was bound before the fire was put to his feet by the troopers of Lord Inchiquin. The cathedral is very rich in monumental remains and magnificently-carved slabs. Among them are tombs of Archbishop Magrath, the plunderer of church property; the Comyn, Pennefather, O'Kearney, Boylan Sherlock and other families.

Among the other remains in Cashel is a Dominican Abbey, founded in 1243, which was a fine building, according to Archdall. There are hardly any traces now left of Hacket's Abbey, founded in the reign of Henry III., and of an hospital founded early in the thirteenth century.

A short drive from Cashel took us to Holycross Abbey. The abbey was founded in 1182 for Cistercian monks by Donald More O'Brien, on account of the Pope having sent a piece of the true cross, encased in gold and set in precious stones. The relic was placed in the high altar, and Camden says that in his day it drew incredible numbers of devotees. The abbey had a charter, which was several times confirmed, and its abbot was a peer, as in England. The building is of Norman workmanship, and may have been, probably, an offshoot of Monasternenagh, as may be concluded from the doorway. In the fifteenth or sixteenth century it was recast internally. In the west end the cellarium still exists, and over it was the dormitory of the lay brethren. It is divided into two buildings, and out of each are garderobes, built in two large projections extending from the west wall, which is an unusual feature, and evidently a late one in a Cistercian monastery. The whole of the refectory and offices connected therewith on the south side of the cloisters have been entirely swept away, but their position can still be traced. On the east side of the cloister garth is the range containing the sacristy, chapter-house, parlour and common-room

of the monks. East of this is a large block of offices and other buildings in a more or less dilapidated condition, which probably comprised the infirmary and abbey-mill. The church, which is cruciform in plan, is 130 feet long, and has a north and south aisle, north and south transept, each having two chapels, a central tower and presbytery. The west portion of the church is less altered than the choir transepts, chapels and presbytery. This portion has been entirely recast, and contains very exquisite workmanship of that period, and a specially interesting series of masons' marks, the carving displaying a great amount of Celtic feeling, and interlaced work of various patterns abounding in all directions. On the south side of the presbytery is a magnificent canopy altar tomb, with armorial arms of the Butler family, over the body of either the wife of the fourth Earl of Desmond or the wife of the fourth Earl of Ormonde. Between the two chapels in the south transept is a very interesting pillared tomb, which is popularly believed to be a tomb of one of the benefactors of the monastery. There are no armorial bearings or other identification, which doubtless were on the slab covering the tomb, the groove containing which is perfect. The beautiful monumental work and carving is largely due to the excellence of the black limestone of which the abbey is built. It is sad, however, to witness the injury that has been done to the carving in recent years. Tourists have been allowed to take away specimens of some of the most beautiful Gothic workmanship in Ireland, and boys are allowed to play against the walls and climb through the windows, destroying the cuspings of their delicate tracery. Part of the carving of the altar tomb has been broken off within the last two years, as was told us by an eye-witness of the act.

The tour ended with Holycross, and as we looked back on it we could not but feel deeply thankful to our able organiser, Mr. Robert Cochrane, who was indefatigable in his exertions, and to the many friends who made our tour one of profit and enjoyment.

THE REJECTED STATUE.

SO many versions have appeared of the causes of the dispute over the statue of Mary Queen of Scots, which M. Ringel d'Ilzach executed for the Duchess de Pomar (who is also Countess of Caithness), the editor of *Le Temps* resolved to obtain information which would present opposite views of the case, and accordingly the sculptor and the Duchess were interviewed.

Some months previous to the opening of this year's Salon, said M. Ringel to the correspondent of *Le Temps*, the Duchess of Pomar came to see me, and informed me of her intention to present a statue of Marie Stuart to the city of Paris. I was asked if I would undertake the execution of the work, on the conditions that I was not to expect payment unless the statue was considered to be worthy of erection in a public place of the city, that the model was to be prepared as quickly as possible and according to instructions to be given by the Duchess, that it was to be exhibited in the Salon, and that the marble statue was to be completed by December 1892. I accepted the conditions. It became necessary, before commencing, to be informed of the ideas of the Duchess, and it was with difficulty an understanding was arrived at. In the first place, I was informed that the Duchess considered Marie Stuart to be superior to Joan of Arc as the tutelary spirit of France, and therefore I was to represent the Queen in the pose of the "génie de la Bastille." She was to have wings, with a star on her forehead, not necessarily of real diamonds, to be standing on one foot, with one leg in the air, the arms were to be stretched in front, and the drapery was to be a simple chemise, which was to fall in graceful lines. After long discussions I was able to persuade the Duchess that it was better to represent Marie Stuart as a Queen than as an allegoric spirit of the Bastille.

Having come to an agreement on one point, I made it my business to seek for portraits of Marie Stuart in the Louvre, and I was permitted to make a model of the face of the Queen after an authentic medal. I next set about the figure. When the model was completed I wrote to the Duchess requesting the favour of a visit in order to obtain her opinion of my work; but I was informed by letter that such a visit was impossible, owing to some difficulty on account of the coachman. I then made a sketch in bronze and sent it to the Duchess. It was declared to be "adorable," and I was asked to obtain a dozen photographs of it, which were to be distributed among her friends. The bronze I had offered, I was informed, was to be preserved as a treasure.

In accordance with the arrangements, I exhibited the statue of Marie Stuart in the Salon of the Champ de Mars. When the Duchess saw it she no longer expressed the admiration she felt on receiving the statuette. In fact, it seemed as if she could not find words sufficiently abusive for my work. The statue was said to be atrocious; it was described as having no resemblance to Marie Stuart—the body was like that of a scared duck and the robe was a coverlet. When I informed the Duchess that I had reproduced the features of Marie Stuart from a veritable portrait in the Louvre, she became very angry. "You believe," she said, "what history relates about Marie Stuart. But you are not aware that in every feature I resemble Marie Stuart. If you desire to realise her face you have only to contemplate mine." I then comprehended, for the first time, that what the Duchess of Pomar wished was that I should have produced her portrait.

In spite, however, of this recrimination the Duchess decided upon offering the statue to the city of Paris. This caused much embarrassment to the Council. The statue was admired, and it was accepted as a work that was historic and decorative, but it was considered that the figure of a woman who had been Queen of France and Scotland would now be inapposite in one of the public places of the city. It was found, too, that a statue could not be erected in a public place without the authority of the Government. Application was accordingly made, and, as a result, a site was offered in the Jardin de l'Infante, which lies between the Louvre and the Seine.

M. Armand Renaud (the director of the Fine Art Department of the Municipality) waited on the Duchess to thank her for the statue on behalf of the Municipal Council, and to inform her about the site which had been assigned for the work by the Government. The Duchess informed M. Renaud that if the statue was not set up in the place she had selected she would withdraw her offer and present the figure to the city of Edinburgh. After a time, however, the Duchess agreed to the site proposed by the Government, but on condition that she was accorded an apartment in the Louvre. I duly informed the authorities of the new proposal, but it was not accepted. The Duchess subsequently decided that she would not present the statue either to Paris or to Edinburgh, and, on the other hand, the action of the Duchess has caused the Municipal Council of Paris to decline the gift.

Such is the state of the affair. What is to be the fate of my statue, and whether it will be necessary to commence an action against the Duchess for payment, are questions for the future.

A correspondent of the *Temps* was also able to meet the Duchess de Pomar at Vichy and to obtain her view of the case. The correspondent having asked whether the Duchess still wished to present the city of Paris with the statue of Marie Stuart, "Certainly," replied the Duchess, "I have never said otherwise. I hold, however, to my stipulation that the statue should be erected at the intersection of the Rue Bremontier, Avenue Wagram and Boulevard Ampère, that is to say, on a small spot beside my own house." The correspondent having informed the Duchess that M. Ringel had stated that she had consented on one condition to the erection of the statue in the Jardin, she laughed and said, "That was in joke, and expressed my desire to be able to see the statue from my own rooms, but I hope no one will take such stories seriously. Besides, it was my intention to have offered a statue of Marie Antoinette for the garden where it was proposed to place that of Marie Stuart. All the difficulties have come from the Municipal Council. I have had interviews with M. Yves Guyot, Minister of Public Works; M. Alphand, and M. Level, the maire of my arrondissement, and these gentlemen have formally declared that they were all disposed to accept my offer."

In reply to another question, the Duchess explained that she was introduced to M. Ringel by her architect. "I proposed to him," she said, "to make for me a statue of Marie Stuart, and he agreed. Then we debated about the conditions. When they were arranged, I sent him a photograph of the figure on the tomb of the Queen in Westminster Abbey, which must have been a good portrait, since it was made by order of her son, James I. I have never expressed any desire about a spirit of the Bastille. What I sought was a Marie Stuart that would be simple, yet dignified, and clad in such a robe as was worn by the Queen on her way to execution, and otherwise to be treated in conformity with the photograph I had sent."

The Duchess admitted that she was delighted with the statuette, and in fact had ordered a dozen copies of it for presentation to the Municipal Council. On being asked to account for the change in her estimate of the work when it was exhibited the Duchess said:—"The reason was it in no way resembled the sketch which had been sent to me. The robe was replaced by a sort of coverlet (*édredon*) adorned with fleurs-de-lys and bands, and in place of a crucifix the hands held a mirror. Who ever saw a queen walking to the scaffold and admiring herself in a glass like a coquette? It is contrary to common sense and to history. Moreover, the statue might be said to represent a pretty woman of twenty; it bore no resemblance to the features of the unfortunate Queen. I must admit, however, that M. Ringel was commanded to remove the cross from the hands of Marie Stuart, which is extraordinary, for history is history, but he could have substituted a prayer-book instead of the mirror. In fact, M. Ringel made the statuette for me, but the fantastic statue that was seen in the Champ de Mars must have been for himself. That is why my admiration was given to one work and not to the other."

NOTES AND COMMENTS.

THE heads of some of the Greek statues are small, and it has been supposed that the sculptors deviated from nature for the sake of effect. From measurements taken by Professor VIRCHOW, of Berlin, it would appear that the sculptors were true to nature. In the course of Dr. SCHLIEMANN'S last excavations in Athens, four skulls were found which belonged to adults if not to aged persons. They were measured by Professor VIRCHOW, and he has demonstrated that the volume was below the average of more modern skulls. He came to the same conclusion in 1871, when the Professor was able to examine another batch of Greek skulls. It is quite possible that quality as well as mass should be considered in such investigations, for the Greeks were at least equal in ability to men who were endowed with bigger crania. Apart from questions of phrenology, the Professor's results are useful, for they show how unsafe it is to adopt a head as a unit of measurement when comparing ancient with modern figures.

THE walls of the Roman station at Silchester are built of flint, and it is considered that the material was obtained in large quantities from the Hampshire downs. The walls are not bonded with tiles, but with a flaggy limestone of the upper oolitic period, which was probably conveyed to the station by boats or rafts along the Thames and Kennet. A local sandstone was employed for part of the walling, and it is evident also that the Romans were able to appreciate the qualities of Purbeck marble. The use of timber for the thresholds of the gates, however, suggests that there was a limit to the supply of stone of large dimensions. Another want of the settlement must have been an adequate water supply, as the only known source that was available is a spring in the valley.

FISHERMEN, agricultural labourers, operatives and proletarians can be well utilised as subjects for pictures, but it is possible to have too much of them. In a French exhibition so many of these people appear on canvas that a historical subject, even if treated in an old-fashioned manner, becomes welcome. Politicians may find it useful to make much of the classes that in numerical strength surpass all others, and we suppose paintings devoted to "the people" are most often recommended by the French deputies to the purchasers for the Minister of Fine Arts. But there should be other considerations, and one of the causes of the decline of painting in France is owing to the premium that is put on subjects in which beauty of form and colours that are not dingy are out of place. At last some amateurs who have grown weary of the sacrifice of art to a pseudo-philanthropy are about to attempt a redemption. A society has been formed to hold exhibitions, and by one of the rules it has been resolved that paintings which are representative of contemporary events, or in which the *marin* and the *bourgeois*, the workman and the peasant will appear, are to be strictly excluded from the galleries. A great many artists have given adherence to the society, and we hope a chance will be secured for all who are not ambitious to aid in the declension of art by producing unpicturesque scenes which a photographer would despise.

THE chief of the Department of Fine Arts of the World's Columbian Exposition, Mr. HALSEY C. IVES, has taken up the matter of the best possible expression of architecture as a fine art, and, according to the *Inland Architect*, has also begun correspondence with European architectural societies regarding adequate exhibits of recent architectural progress. A special effort will be made to secure from Europe as large collections as possible of reproductions from monumental decorations, which, it is expected, will probably remain in America, and give a rare opportunity for comparison. Building and construction will not be included in the Department of Fine Arts exhibit, this belonging to the class of civil engineering, as constructive architecture, in the Department of Liberal Arts. These subjects, which belong to Class 839 in Group 148, Department L, Liberal Arts, include the following:—Plans of public buildings for special purposes; large and small dwelling-houses. Dwellings and specifications for foundations, walls, partitions, floors, roofs and stairways. Estimates of amount and cost of material. Designs and models of special contrivances for safety, comfort and convenience in the manipulation of elevators, doors, windows, &c. Working plans for the mason, carpenter and painter—designs and models of bonds, arches, coping, vaulting, &c.; plastering and construction of partitions; painting and glazing. Plans of appliances for hoisting, handling and delivering. Building materials to artisans—scaffolding and ladders; special scaffolding for handling great weights; portable cranes and power elevators. Illustrations of the strength of materials. Plans and sections of special architectural forms—metallic floor-beams and girders; hollow bricks and other architectural pottery for heating and ventilation; metallic cornice and conduits; shingles and sheathing; glass roofs, floors and accessories; architectural hardware. Methods of combining materials. Protection of foundations, areas and walls against water. Working plans for paving and draining. According to the rules and regulations issued by the Department of Fine Arts, the subjects exhibited in this department will include sculpture, fresco painting on walls, and antique or modern carvings, and architects everywhere should be interested in making this department notable. In general, all works to be admitted to the Department of Fine Arts must be originals, with the exception that casts from original works by modern artists are placed in the same class with original figures and groups in marble. There will be three sections in the department: an American section, a section for foreign countries that are represented by a commission, a section comprising private collections and the works of artists from countries not represented by a commission, and all works must be examined by an official jury before they can be admitted.

ARBITRATIONS in respect of disputed accounts for architectural or engineering construction are generally unsatisfactory for all parties interested. The Liverpool Corporation of late have had much experience in that mode of obtaining settlements, and always have suffered disappointment. The case relating to the tunnel beneath the Mersey, which forms part of the works for water supply, is the latest. Messrs. MONK & NEWELL, the contractors', claim has been reduced by over 11,000*l.*, but as a set-off the arbitrator would not award any of the damages claimed by the Corporation. For work done the contractors claimed about 7,500*l.*, and the Corporation officials put down the value at 2,500*l.* The arbitrator awards 5,000*l.* It is anticipated that the arbitration will cost the Corporation between 4,000*l.* and 5,000*l.*, to which sum must be added the costs in the law courts. The loss to Liverpool is estimated at 20,000*l.*, and one of the councillors was justified when, on Wednesday, he declared the case was another illustration of the folly of the Corporation in allowing themselves to drift into litigation.

ALTHOUGH the air of Paris seems to be exceptionally pure for a city where so many inhabitants congregate and manufactories are not unknown, there are signs in the streets of the disintegration of building stones. They are infinitely less numerous than in London, and it may be on that account they secure more attention. In the case of one building the defects are just now exciting some alarm. All visitors know the church La Trinité, which was erected not many years ago, Early Renaissance having been adopted with much freedom for the style. The design failed to please Mr. FERGUSSON, but he admitted that the proportions were good and the ornamentation rich. As in most French buildings of importance, sculpture is introduced with much judgment. The stone used for some of the statues does not appear adapted to withstand the air that blows down from Montmartre, and parts of figures have fallen. There are so many sculptors available in Paris, it is not difficult to replace a series of statues, and accordingly the apprehended destruction of the figures does not cause much grief. But in front of the church is a garden, which is much frequented by nurses, children and assiduous readers of journals. They are now held to be in danger, through the want of cohesion in the stone. If an accident were to arise to the least among them from the fall of a head or an arm of a statue, it would go hard with the civil and other authorities who have control of the churches.

PUBLIC BATHS AND PUBLIC LIBRARY, DEWSBURY.

WE give an illustration of the designs submitted in competition by Messrs. DAWES & HOYLAND, of Manchester and London, for the proposed new baths and library at Dewsbury. The accommodation comprises one first-class swimming-bath, with galleries over for the use of spectators at swimming fêtes; and one second-class swimming-bath, with the necessary number of dressing-boxes in each. First and second-class private baths for ladies and gentlemen, Turkish, shower and vapour baths, superintendent's office and residence, urinals, water-closets, boiler-rooms, drying-closets, accommodation for washing and drying towels, bathing drawers, &c., but no public laundry, as it was not considered necessary. Provision is made for complete water supply, drainage, heating, lighting, ventilating and all fittings required. The library contains the following rooms:—Lending library, newsroom, reference library, stock-room, committee-room, ladies reading-room, juvenile reading-room, water-closets, lavatories, &c.

In accordance with the instructions issued to competitors, the cost was not to exceed 12,000*l.* The principal front of the building was to face Wellington Road. All the outside work to be of stone. The rooms used for library and reference library to be fireproof. The water from the roofs, yards and swimming-baths to be conveyed to the nearest surface-water main drain, and the sewage proper to be delivered into the nearest main sewer. A double penstock chamber to be constructed to receive the sewage and surface water, and to contain two penstocks, and arranged so that the surface water may be used for flushing purposes when required.

The first-class baths are of a suitable length for swimming races and entertainments. All steps are recessed in the wall, and there are no fixed obstructions in the swimming-baths below the water-line. The ends of the baths are rectangular, with slightly rounded corners. Provision is made for the water from the first-class bath to be run into the second-class swimming-bath; but separate outlets also are provided, so that either can be emptied independently of the other. The first-class swimming-bath is arranged so as to admit of its being converted into a gymnasium during the winter. For this purpose a strong roof is constructed for attaching gymnastic apparatus. In the second-class bath a "soaphole," or small additional bath, is provided. Both the swimming-baths slope from end to end.

Separate entrances are provided for the baths and library. The library and reading-rooms are so arranged that the attendants in the library can overlook the reference library and reading-rooms. The site contains about 2,108 square yards available for building upon.

THE ORDNANCE SURVEY.

A PAPER was read by Mr. H. T. Crook, C.E., at the Cardiff meeting of the British Association on the Ordnance Survey. He said the failure of the Ordnance Survey to supply the cartographical needs of the general public was sought to be excused on the ground that it was not the Department's business to cater for the public, and that its attention had been chiefly devoted to the cadastral survey. The Department would appear to wish to be judged by the work which it did for special State purposes and for particular classes who used maps in their professional avocations. It was to those engaged in Imperial and local administration, to engineers and others engaged in public works, that the survey authorities more especially appealed. To these classes good large-scale surveys were absolutely indispensable. That was why he ventured to ask their attention to the subject, believing that at a time when some interest had been aroused in the question and reforms promised, that an expression of opinion from those most competent to judge of the work of the survey could not but be of advantage. The general efficiency of the organisation for surveying and the mathematical accuracy of the work done were not disputed, and they were so greatly extolled annually in the report of progress presented to Parliament that there was no necessity to dwell upon them here. Very likely the military organisation had been of some advantage to the service in establishing discipline, order and regularity, and so long as it worked well there was no reason why it should be changed until the original surveys were completed. He specified plans and maps which were being made and published, and contended that no adequate or systematic provision has yet been made for a periodical revision of the completed town and parish plans, and consequently for the smaller scale maps also which were reproduced from them. Besides the completion of the 25-inch map in Lancashire and Yorkshire, there remained six Scottish counties and almost the whole of Ireland, excepting Dublin, to be surveyed on this scale. The money for this re-survey should be voted under a separate head in the Estimates; the public would then be able to see how ridiculously inadequate was the sum allowed for the real revision work. Twenty years ago General Sir Henry James estimated the amount required annually would be about 40,000*l.*, since when the number of kinds of maps published had increased, and the larger population and development of industries caused more changes in the detail requiring correction. The appropriation of the Parliamentary grant was as follows:—

Year.	Total Vote for Survey.	Under head of Cadastral Survey.	Under head of Revision.	Cadastral Survey and Revision together.
	£	£	£	£
1886-87 . .	258,000	189,951	5,000	194,951
1887-88 . .	230,000	149,079	15,500	164,579
1888-89 . .	223,000	93,164	64,000	157,164
1889-90 . .	215,000	72,000	74,000	146,800
1890-91 . .	216,000	30,000	139,860	169,860
1891-92 . .	215,770	22,300	139,950	162,250

The remainder of the grant was absorbed in the expenses of publication, special work for other departments, and maps for the Land Judges' Court in Ireland. The total vote here given did not include military pay and other expenditure, for which about 50,000*l.* per annum was provided under other estimates. He had not been able to find what the entire cost of the survey amounted to from the commencement to the present date, but it was obvious that it must be a sum of many millions. If the work was worth doing it was the height of folly not to allow an adequate sum for its maintenance. Owing to the neglect of revision, a large portion of the country would have to be re-surveyed at a greatly increased cost to the country over the amount which would have been sufficient had a proper system of periodical or constant revision been in operation. And not only was the direct cost increased, but indirectly a very large expenditure is constantly going on all over the country to bring the plans or maps up to date when they are required for public or private use, in local government public works or land transactions. As plans or maps so corrected are not available for general use, the work was often done many times over.

He suggested that first of all the enormous accumulated arrears must be got rid of. All those portions of the country where the changes had been great, either on account of the increase of population or the lapse of time since the survey was made, should be dealt with as re-survey, and a vote of sufficient amount taken to enable the work to be completed in the shortest possible period. Then with regard to the revision, he suggested that it be carried on at least in the larger centres of population continuously under a civilian staff, which should have its permanent superintendents not liable to be removed after a short interval, as are the R.E. officers. The country should be divided into a number of convenient districts, each with its ordnance survey office superintendent and assistants responsible for the revision of the maps of the district once during the revision period. The services of this office might be at the disposal of anyone requiring a plan or map with manuscript corrections to date, on the payment of fees proportionate to the services rendered. By this means the materials for new editions in the larger towns would be constantly accumulating, and wherever the sale of maps was large, new corrected editions could be published at little expense without waiting for the revision period to expire. That such an office would be largely resorted to there could be no doubt. Large sums were spent by the municipalities of our great towns in keeping the town map up to date. There were several instances where the Department had been paid for revised maps or for surveys made in advance of the general survey of the particular county or district. The principle of the method he advocated was therefore already adopted; it only required to be developed and systematised. Of the town plans and the parish maps it

would be difficult to justify any complaint grounded on absence of information which ought to be given on maps of the kind, but with regard to the 6-inch maps it was otherwise. The 6-inch map had no *raison d'être* if it was not for the use of the engineer, geologist, and other scientific workers. Yet in its present form it was lamentably deficient in the very information which they most require, that was, it failed in depicting the form of the terrain. Among the defects of the six-inch survey was its publication as a county map. For most of the purposes for which this map was used, the political or administrative boundaries were of secondary importance. But because the map was originally ordered by Parliament as a county map, the Department, in slavish adherence to routine, continued to regard each county as though it were an independent state or an oceanic island, thus making it difficult to form a decent map of a river basin if it were in more than one county; and if it were in four counties, as in the case of the basin of the Mersey, the task was impossible. There was apparently no reason why in new editions of the six-inch maps the sheet lines should not be arranged so as to avoid the unsatisfactory and expensive patchwork caused by the inter-lapping of plans constructed to different meridians. If the entire map of the kingdom were constructed in long sections, each with its central meridian, the distortion would not be nearly so great at the lines of junction as it is under the present system on the boundaries of a large county such as Yorkshire. An important consideration in regard to the sale of maps was the scale of prices. This varied in an extraordinary and inexplicable manner, and in the case of the cadastral maps some of the charges were extortionate and prohibitive. Another point was the absence of any index worthy of the name to the plans and publications of the Ordnance survey. The difficulty to the public of getting information about the maps was very great. The Government exacting cash payments from the agent, he could not give long credit to the country booksellers, and consequently they did not (with a few exceptions) keep any stock of the large scale and expensive plans. Even for those who "knew the ropes," to obtain a large scale map in the country was a matter often involving much loss of time and trial of temper. He said, in conclusion, if these various matters were attended to, the utility of the survey maps would be vastly increased. The high scientific work of the survey had been admirably accomplished, and if the nation was to see full value for its expenditure on this service it was essential that the value of the work be maintained by revision, and that more businesslike arrangements be made for the publication of the maps.

Mr. Oliver Jones referred especially to the latest surveys on the 25-inch scale, and said it was very unfortunate that when the ordnance surveyors were about the country getting the names of places, they would insist upon going to persons who had no knowledge of the subject. Hence had crept in various inaccuracies.

Mr. Tait pointed out defects in the 6-inch survey of Antrim, in which the contour lines were not complete.

Dr. Trelawney Saunders called attention to the want of contours in Devonshire maps in respect of eminences above 1,000 feet, and condemned the petty economy which had been exercised by the Department. He spoke of means available for accomplishing the revision.

Mr. Batten dwelt upon the importance of the 1-inch survey, and thought the attention of the authorities should be directed especially to the desirability of its being completed.

Mr. Whitmell mentioned as a curious circumstance that the map of the locality showed Barry Dock, but did not show the railway which supplied that dock with coal.

Mr. Usher pointed out a defect in regard to the coast-line.

The President spoke of the necessity of impressing upon the Government the desirability of liberal grants being made towards the purpose of keeping the maps up to date. He expressed to Mr. Crook the thanks of the section.

SCOTTISH MONUMENTAL EFFIGIES OF THE FIFTEENTH CENTURY.

SCULPTURED monumental tombs of a good class, prior to the Reformation period, are exceedingly scarce in Scotland. The few that exist, says Mr. Brydall in the *Glasgow Herald*, are in the lowlands and more eastern parts of the country, in connection with churches associated with the development of the early Gothic or English-Norman style of architecture; but the numerous now vacant recesses, such as in the cathedrals of Dunblane and Aberdeen, as well as fragments which have been discovered at various intervals, testify to the fact that they were at one time very numerous. Excepting the peculiar one attributed to Marjory Bruce, known as "Queen Blearie," in Paisley Abbey, no monumental tombs of royal personages now exist in Scotland. Those of Mary de Couci, the second wife of Alexander II., in Newbattle Abbey, Robert the Bruce in Dunfermline, and Robert II. at Scone have long ago disappeared, and the empty sculptured canopy of the tomb of Bishop Kennedy at St. Andrews is probably the only representative of our ecclesiastical monumental tombs. The effects of time, the ravages of war, the convulsions of the Reformation, and the unprincipled pilferers of stones from our old edifices, have in this respect impoverished the country.

By far the most interesting and important effigies in Scotland are those of the Douglases in the Kirk of St. Bride at Douglas. According to the dates which are attached to the personages represented the oldest is the figure of Marjory Abernethy, wife of Hugh, sixth Lord Douglas, who died in 1259. The stone is very much crumbled away, the figure is clothed in simply-arranged drapery extending from the shoulders to the feet, which rest upon a spiritedly-carved block, covered with foliated ornament of the style of the period. The effigy of the good Sir James, who was killed by the Moors in 1330-31, is considerably mutilated; the head seems to have been clothed in a camail or hood of mail, with an orle or wreath; a simply and well-arranged surcoat, parted above the knees, discloses an under tunic; the left hand grasps a sheathed sword-hilt attached to a slightly-ornamented belt, the arm being covered by a shield; the right arm and lower left leg are gone. The figure bears a kind of resemblance to those in the Temple Church of London of an earlier date, and it is to be noted that while this Douglas is cross-legged, that custom had at the period become nearly obsolete in England. The probability of course is that he was thus represented on account of having died while engaged in pilgrimage and in battle against the enemies of the Cross.

In the same place is a large canopied tomb of Archibald, fifth Earl of Douglas, Marshal of France, and second Duke of Touraine, which latter title was conferred by Charles VII. of France upon his father, who was slain at the battle of Verneuil, and buried in the church of St. Gratian at Tournai in 1424. This Earl Archibald, who died in 1438, is represented habited in his robes of dignity, coroneted, with a broad, rich belt round his waist, and an almost obliterated marginal inscription. The base contains five, remaining out of six, small upright canopied figures extremely quaint and elaborate.

A less ornate but more beautifully-executed monument in the same place contains the broken effigies of James, surnamed the "Gross," seventh Earl of Douglas, died 1443, with his wife, Lady Beatrix Sinclair, daughter of the Earl of Orkney. On this tomb the earl is represented in armour, with a rich girdle, collar and mantle, the hands pressed together, and the wreathed head resting on a conical tilting helmet. It is surmounted by a full heraldic achievement; the base contains six small male figures—the second of which is habited as an ecclesiastic, and the others in armour—and four female figures, the last of which, from the headdress, is supposed to have been unmarried; the male and female figures are divided by an angel bearing impaled and quartered arms. The carvings over the mouldings of this beautiful wall-tomb are of remarkable elegance, bearing a very close resemblance in the execution to similar details on the walls of Melrose Abbey, possibly executed by the same carvers. It is said that the mutilations on these figures were largely the work of some of Cromwell's troopers who were at one time quartered there. Even yet traces of the former painting and gilding are evident on the escutcheons as well as on the figures, the restorations having been judiciously confined to the canopies and mouldings.

In addition to those on the Douglas tombs of the chivalric fifteenth century, which record the prowess of the knights of that illustrious line and the renown which they gained under the oriflamme of St. Denis, a sufficient number of other figures exist in Scotland which serve not only to illustrate that branch of the art of the country, but also to display the rich knightly armour and costume of the period. Interesting effigies of one of the knights of Houston and his lady are preserved in the modern parish church of Houston in Renfrewshire. The knight died 1450, and the lady six years later. His effigy represents him fully armed, spurred and helmeted in a large bassinet with a broad sword girdle of a rich and bold design; the jupon bears an escutcheon on the breast, on which the arms are faintly traceable, and the lower edge is carved into an elaborate leaf pattern. It bears a tolerably close resemblance to similar English effigies. This is especially noticeable in the figure of Sir Thomas Cawne in Ightham Church in Kent, almost identical in costume, the chief difference in treatment consisting in the Scottish knight having his hands pressed together as if in prayer, while the English one has his right hand on his breast and his left on the sword-hilt. It also bears some resemblance in point of costume, although of a rather later period, to the effigy of John de Montacute, a younger son of the first Earl of Salisbury, whose will is dated 1388. The effigy of the lady represents her in an extremely graceful costume; the head-dress, unlike the fantastic forms then in vogue, may be described as a kind of small turban with a slight fringe of hair or lace depending from it on to the forehead, and a side veil with broidered edge falling over the shoulders. A close-fitting bodice extending considerably lower than the waist is richly

embroidered ; the tight sleeves are seamed with a double row of pearls ; the dress falls from beneath the bodice in simple folds covering the feet ; and the mantle, which is fastened across the breast from the shoulders by a cord, has a rich border of fleurs-de-lys and pearls. The resemblance between this and English female effigies establishes the fact that the costume of the upper classes of the two kingdoms was very similar, Scotland being rather later in the adoption of new fashions.

Almost identical with the Houston effigies are those on the tomb in the parish church of Renfrew. Over the arch, in Saxon letters, is the inscription, "Hic jacet joh[anne]s ros miles quo[n]dam dominus de hawkehede et marjoria u[x]or sua or[a]to pro ipsis qui obiit." These lie upon a base containing eleven upright panels, nine of which contain armorial bearings, the first being filled in with an angel playing on a violin and the eleventh with a lute. As on the Houston effigy, the knight's helmet is of the form known as the great bassinet, with neck-pieces of plate and the shoulders covered by mail. The latter in this case is the ordinary ringed kind, while the Houston mail is more like the kind known as "rustred." This form of helmet was in use as early as the thirteenth century, and was superseded by the salade in the fifteenth, to which this figure belongs. The effigy of the Stewart of Bute (1296?) differs in this respect, having a smaller bassinet and the head resting on the larger tilting helmet instead of a cushion, being proof of an earlier date. The great vizorless bassinet was in use in England and on the Continent in the fourteenth century, but the form of the sollerets, as well as the mail on the shoulders, are characteristic of the middle of the fifteenth century. This Sir John Ross of Hawkhead is the hero of a local tradition, variously told, from which he received the sobriquet of "Palm-my-arm." Apart from this we find him as Ross of Halket, along with two of the Douglases, accepting the challenge of three Burgundian knights—the two Lalains and Meriadet, Lord of Longueville—at a tournament held by James II. at Stirling, on the occasion of his marriage with Mary of Gueldres. In this encounter the Scots were not quite so successful as was Ross in the local tradition, the king having thrown down his gauntlet as a sign to stop the contest when one of the Douglases was felled by the axe of his opponent. This occurred in 1449.

The Corstorphine monuments are well known to all those in Edinburgh interested in such remains. Of the two in the chancel of the church that to the right of the doorway is cut in marble, and represents the second Sir John Forrester, who succeeded in 1441 (died 1454), with his wife Marian Stewart, Lady Dalswinton, widow of Sir John Stewart. He distinguished himself as a military man, especially at the siege of Branxton Castle. The other tomb bears the figures of the Sir John Forrester who in 1429 founded the Collegiate Church of Corstorphine and was Lord Privy Seal during the Regency of Murdoch, Duke of Albany. It is stated that he was thrice married, but this is doubtful, and the lady who lies beside him on the tomb represents Dame Jean Saintclair, a daughter of Henry, Earl of Orkney. The bases of both of these contain family armorials, and the date of the costumes corresponds with the period with which they are identified. The present Heraldic Exhibition contains a drawing by Mr. Bruce Armstrong of the curious and interesting figures, of an earlier date, of Walter Stewart, Earl of Monteith, and his wife, in the chancel of the Priory Church of Inchmahone, the Isle of Rest. The group is peculiar, as representing the husband and wife in a loving embrace.

THE LATE LEONARD C. WYON.

THE Royal Mint has lost a valuable officer by the death of Mr. Leonard C. Wyon, modeller and engraver, and one of a family that has long been associated with that Department. Mr. Leonard Wyon was the son of the late Mr. William Wyon, R.A., chief engraver to the Mint, and was born at the Mint in 1826. He was educated at Merchant Taylors' School, and was silver medallist of his year at the Royal Academy. In 1843, when he was only 17 years of age, he was appointed assistant engraver to the Mint, and on his father's death in 1851 he became modeller and chief engraver. He also succeeded his father as engraver to the Goldsmiths' Company, and was subsequently appointed engraver to the Assay offices of Birmingham, Sheffield and Chester. Mr. Wyon's whole life being thus passed in the designing of coins and medals, it is not surprising that the list of his works is somewhat long. He designed the present British bronze coinage, the original British florin, and the coinage of Australia (1857), New Grenada (1858), Canada, Cyprus, United States of Columbia, Straits Settlement, Jamaica, Uruguay, Hong Kong, Japan, Peru, Newfoundland, and the present coinage of British India. Among the war medals of Mr. Wyon's design are those for the Indian Mutiny (1857), Afghanistan (1878), Ashantee (1875), and Zululand. For the Art Union of London he designed, among others, medals of Sir D. Wilkie, J. M. W. Turner, Hogarth and T. Banks. His miscellaneous medals were exceedingly numerous, but among them should be mentioned a medal of the Emperor Nicholas of Russia, in connection with which Mr. Wyon received a graceful letter of thanks from Mr. Gladstone ; a medal to commemorate the exchange of visits in 1855 between the Queen and the Emperor of the French, and a remarkably fine portrait of William Wordsworth (1848), from a drawing from the life. This portrait, which is said to represent Wordsworth better than any other, has been reproduced in Professor W. Knight's "English Lake District." Other notable medals were those for the Great Exhibition of 1851 (the reverse only), the Exhibition of 1862, the Sydney Exhibition, 1864, and the Colonial and Indian Exhibition. These were among Mr. Wyon's chief works ; it should also be stated that many portraits of royal and other eminent persons, commissioned for various schools, societies and institutions, have been produced from his designs.

HERALDRY IN ARCHITECTURE.

THE following most interesting article is one of a valuable series which is appearing in the *Scotsman* upon the Edinburgh Heraldic Exhibition :—The ancient and truly distinctive architecture of Scotland is an ever-engaging study to all who possess patriotic feeling and artistic perception. A cursory glance at the old Scottish castles, or at representations of them, shows that, next to general grouping and structural details, heraldry presents itself as their most prominent feature of ornamentation ; and in many examples the only decorative features of any consequence are heraldic. In the drawings of *Tolquhan Castle Entrance*, by Mr. M'Gibbon, No. 172 in the present exhibition, and of *Rowallan Entrance*, by Mr. Ross, No. 182, the arms are introduced in a most effective manner over the doorway between the two bold circular towers, and form the chief point of interest in the design. In No. 181, the *Gateway of Mar's Work, Stirling*, there is a similar method of arrangement, but in this case the side towers are semi-octagonal in plan, and on the front face of each there is the addition of heraldic panels. Many of the drawings of old houses show the arms embedded or raised on simple panels over doorways when no other enrichment is resorted to. In the drawing of the *Grand Staircase of Fyvie Castle*, No. 174, there is a clever disposition of various heraldic devices, and the bold armorial band encircling the newel is a good example of the decorative utility of heraldic designs.

Armorial enrichments have a fascination which is quite unique. That which stimulates thought in any design is always more or less engaging, and as heraldry recalls and suggests such a variety of interests in connection with individuals, families, places and events, and links the present with the past, any opportunity for its introduction is welcome to the architect or designer. But, besides this, there is the charm of variety in forms of things animate and inanimate, drawn from the heavens above, the earth beneath, and the water under the earth, introduced in all the varied treatments of armorial design. Many of the illustrations in the exhibition show that in the placing of armorial bearings and in the free handling of details there is an easy adaptability to the spirit of the style in which the architect may be working. In this connection a choice armorial might be referred to—No. 673—in which the draughtsman has made the freest use of the mantling and motto tablets to give a highly decorative effect. A beautiful coat-of-arms of the Earls of Kinnoull combined with ornament in carved wood, No. 230, should also be noticed in this connection. Here the scrolls, leaves and mask are so combined with the arms as to render the composition a perfect one. Where there has been a tendency to freedom in ornamentation in any architectural composition which admitted of heraldic display, we find the most unrestrained use, not only of mottoes, symbols, monograms, but also of armorial devices, and these are introduced in every conceivable way in stone and wood-carving, marquetry, enamelling, painting, stained-glass, iron, brass and other metals and embroidery. This ornamentation was not confined to the permanent or structural portions of buildings, but was adopted freely in the adornment of all kinds of movable furniture, textile fabrics, metal and earthenware dishes, and applied even to door-knockers, as in No. 223*a*, and fire-irons, No. 69.

All designers when dealing with elaborate schemes are conscious of the risk of tiresomeness and insipidity in ornamentation derived from merely floral or animal types which have no special reference to the work in hand ; but when heraldic details can be introduced there is at once a strong *raison d'être* for the cleverest dispositions of decorative display. In addition to the value which these details contribute in the matter of form in flat drawing or on modelled surfaces, there is the charm of colour. For this we have to go to the interiors of our old buildings, where alone such means of colour expression as were in use in our country could have any permanence. The student is referred to the well-drawn and coloured illustrations, Nos. 204 to 210, of tempera work on walls and ceilings in

Earl's Hall, Stobhall and Belbegno, and also to the decorated ceiling of the Skelmorlie Aisle at Largs, Nos. 153 and 154. Nos. 206 and 208, showing the heraldic and other decorations upon the bosses between ceiling-joists, are good examples of several ceilings yet remaining. No. 154 (ceiling of Skelmorlie Aisle, Largs) should be noted as an example of clever delineation, and in studying such an example one cannot help desiring that similarly bold and artistic decorative work might be revived amongst us. Nos. 160, 262 and 263 (the Crawford Gallery in Kilbirnie Church and its heraldic details) afford illustrations of the introduction of a richly-ornamented gallery in an old church, which forms a most picturesque feature, and one well worthy of repetition in modern work. It might be remarked in passing that had our old Scottish architects been in contact with mosaic workers there might have remained to us some lovely gems of external emblazoning in the hoary stone settings of the noble ruins which still exist.

Monumental compositions such as No. 153, monument of Sir Robert Montgomerie, in the Skelmorlie Aisle, Largs, give a very effective opportunity for the introduction of coats-of-arms, as do also tombstones, of which many illustrations are given. A photograph of the picturesque entrance to the burying-vault of the Earls of Southesk might be noted. The two heraldic panels so simply introduced give the value to this composition. Drawings of quaint recumbent figures, such as No. 860, the monument to Walter Stewart, Earl of Menteith, at Inchmahone, are interesting on account of the large shields with coats-of-arms which are held at the side of the figures.

The broad and manly treatment of heraldic delineation must impress all who study the samples brought together in the exhibition. This most excellent characteristic is mainly due to the necessity there was for the most perfect clearness and legibility; the heraldic designs on emblazoned shields, embroidered cloths, stained-glass and sculptured work, requiring often to be seen at long distances from the beholder, and it is due also to their application being upon large surfaces of stone, wood or plaster, broken with strong mouldings and other architectural features, which all demanded that the heraldic work should be broad and very architectural in its character. The spirit of those ages in which heraldry grew into importance, both in our own and in other countries, had much to do with the strong artistic spirit which animates it, and too much praise cannot be bestowed on many of the exhibits which have already been referred to in other articles; while many of the later examples, especially among the seals and books, illustrate the decadence of heraldic style in the relaxing period of the later Renaissance.

Monumental brasses are of two kinds; the first consists of a quadrangular plate of brass, or of several joined so as to look like one, let into a stone slab, and engraved generally with the effigy of the person commemorated, an architectural framework with minor figures, coats-of-arms, and an inscription in the border; the background on which all these are engraved being usually elaborately diapered. This plan obtained on the Continent. The second kind of brass is the distinctively British or perhaps English kind. It consists generally of the effigy, an architectural canopy, an inscribed border or inscription plate, and a coat or coats-of-arms, all cut out in brass plate, and inlaid in their allotted positions in the stone, which forms their only background. It was thus made, perhaps, for want of brass originally, but it had the advantage of concentrating the eye on the material parts of the memorial, and perhaps concentrating the care of the engraver on the details of the effigy, &c., rather than on the background. When the brass was, as the oldest all were, set on the floor of a church or the top of an altar-tomb, the effigy was designed almost universally in a recumbent attitude, the exceptions being where it was drawn as if standing. On the mural brass, on the other hand, there was no border, and the effigy was exhibited kneeling. At an early period Continental brasses of Flemish construction and design were introduced into England, and at a later period small mural brasses began to be made in England on the Continental plan of a continuous plate. The engraving of the brass is usually done with a bold hand, but yet frequently with laborious detail and an elaborate and beautiful ornamentation. And to the fidelity of the artists of these contemporaneous records of individuals and arms, and to the fineness and durability of the metal they worked in, the herald and genealogist of to-day, to say nothing of the student of costume and the historian in general, owe some of their most important and most reliable information concerning the best ages of heraldry. But it is the very value of the material they used which has deprived us of the benefit of the greater part of their labours. The use of brasses was introduced into Britain probably about the beginning of the thirteenth century. We have evidence that the plunderer of brasses was at work there about the middle of the fifteenth, and he has been at work ever since. In early times he had ready purchasers for his spoils in the persons of the makers of new brasses, who frequently could modernise the armour of an effigy to suit altered times, or, if the plate indeed had not been turned already, could place its face downwards and engrave a new effigy on the back. Many instances of this have been discovered, where even the second engraving is comparatively early. And if all such expedients failed, the plate was still eligible for the melting-pot, to which too many hundreds, nay thousands, of brasses were consigned in aftertimes.

Scotland, whether from lack of money or abundance of stone quarries, seems never to have been very rich in brasses. However, though they are not numerous, those she possessed were pretty generally distributed. There is evidence or record of brasses having once existed in Iona, Kirkwall, Dunblane, Dunfermline, Arbroath, Seton, Whitekirk, &c.; and examples are still extant in Edinburgh, Ormiston, Aberdeen and Glasgow. English authorities argue from the character of the canopies engraved on their brasses that they were designed by the designers of their churches. If their theory holds good, Scotland, before the wars of Wallace and Bruce, may have obtained its brasses from England, whence came its "Early English" architecture, and subsequently it may have procured them or their designs similarly from France. There are few data left by which to determine this question, but it is certain that brasses on both English and Continental models have existed here. In the floor of Whitekirk parish church in East Lothian lay, till recently, a large stone slab showing the matrices of a brass of the English pattern. In the centre the effigy of an ecclesiastic has been inlaid, while round about, near the margin of the stone, are the hollow of the canopy and inscription plates. At Iona is a similar slab of great size, in which has been inlaid the effigy of a knight in armour with his sword by his side, and with his feet resting on some animal. Round the edge of the stone is the groove in which ran the border with an inscription. According to tradition, this brass was in memory of a Macleod of Macleod, and was embellished with a plate of silver. These stone matrices are described by Sir Daniel Wilson in his "Archæological and Prehistoric Annals of Scotland," and he adds that similar specimens are by no means rare. The brass at Kirkwall in memory of one of the Tullochs, bishops of Orkney, in the fifteenth century, and which is said by Principal Gordon, in his "Remarks on Orkney," to have been carried off by Cromwell's soldiery, was, on the other hand, on the Continental pattern—"a plate of copper, the full length of the grave."

The ancient Scottish brasses still in existence consist each of a quadrangular plate. They are all mural, and, with the exception of the Liddel brass in St. Nicholas's Church, Aberdeen, are small. The date of the earliest of these—the Irving brass—is about 1450. The earliest known English-made brasses of similar construction, such as that of Sir Thomas Sellynger, founder of St. George's Chapel, Windsor, date not earlier than 1475. The Irving brass alluded to is in the Drum Aisle in St. Nicholas's Church, Aberdeen. A rubbing of it (No. 1,132), taken by Mr. J. S. Davidson, Aberdeen, appears in the exhibition. It is a small plate (18⅛ inches by 13½ inches) containing an inscription, in old English characters, with—"In memory of Sir Alexander de Irvyn, second laird of Drum, Achyndor, and Forglen, of his wife, Elizabeth, daughter of Robert de Keith, Knight Marischall of Scotland." Blanks are left for the dates of their deaths, which had not occurred when the brass was erected. Two small shields near the margin of the plate bear respectively the Irvine holly bunches and the pales of Keith. This brass is noticed at some length in "Scottish Notes and Queries" of January 1888, by Mr. A. M. Munro, who points out that the popular idea is wrong in attributing this memorial to Alexander Irvine, who died in 1411 at the battle of Harlaw. This Alexander certainly married Elizabeth de Keith, but Douglas relates that he went merely through the marriage ceremony, and, falling in battle immediately thereafter, was succeeded in his estates by his younger brother Robert. Robert, on succeeding, changed his name to Alexander, and in fulfilment of a promise made to his elder brother on the way to the battle, married the widow. It is believed that it was to this Alexander, who died in 1457, that the brass was erected. Mr. Munro's theory of the blanks in the inscription is more charitable than the more usual one, which ascribes their continued presence to the negligence or the want of filial piety in the immediate heirs of the deceased. The probable reason was, he says, "simply that no person could be found in the locality to finish the work of the Continental engraver." Alexander Irvine died in 1457. The brass for the monument which the Provost and Magistrates of Edinburgh undertook, in 1454, to erect in St. Giles's Church in memory of Preston of Gorton, who brought to Scotland and bequeathed to St. Giles's an arm bone of its patron saint, was "a plate of brase, with a writ specifiand the bringing of that relik by him in Scotland, with his armis." This brass is not known to exist now. In the Old Church of Ormiston, in East Lothian, is a brass similar to these in containing only an inscription and armorial bearings, but larger and more ornamental than the Irvine brass. It dates from about 1563, and bears the arms of Alexander Cockburn and his wife, Alison Sandilands. The inscription, which is lengthy, is in Roman capitals. A

rubbing (No. 194) of this brass has been contributed by Mr. T. Ross, Edinburgh, and it has also been figured in Stirling Maxwell's "Ornamental Heraldry of the Sixteenth Century." The only ancient brass now existing in St. Giles's, Edinburgh, is that in memory of the Regent Moray; it is additionally interesting as bearing an inscription from the pen of George Buchanan. Mr. Ross's rubbing of it is No. 1,193 of the catalogue. In the upper part of the plate is the quartered coat of the Regent's arms, indicating his royal descent, and his possession of the earldom of Moray. Over the barred helmet, which is heavily mantled, is his coronet; above this his crest—a pelican in her piety. The supporters—collared greyhounds—stand on a compartment. The motto is "Salus per Christum." On either side of this achievement are seated figures, emblematic of Religion and Justice. They are represented weeping. Above them respectively are scrolls with the words "Religio" and "Justitia"; beneath are the legends "Pietas sine vindice luget" and "Jus exarmatum est;" in other words, "Piety without a defence mourns," "Justice has been disarmed." In the centre of the brass is the date (old style) of the Regent's assassination—"23 Januarii 1569." The lower part is occupied with Buchanan's inscription in Roman capitals, "Jacobo Stovarto Moraviæ Comiti Scotiæ proregi viro ætatis suæ longe optimo ab inimicis omnis memoriæ deterrimis ex insidiis extincto ceu patri communi patria mœrens posuit," which may perhaps be rendered, "A country, sorrowing as for a common father, erects this monument to James Stewart, Earl of Moray, Regent of Scotland, by far the noblest man of his age, slain from an ambuscade by the basest enemies in all history." We sometimes posture as mourners over the real or supposed vandalisms of the Reformers, but never before the brass of the Regent Moray, for it and the monument of which it was only a part were the creation of the Reformation age, James Gray, an Edinburgh goldsmith, being the engraver, and they were respected till our own nineteenth century, when, in 1829, they were pulled down and cast out of the church. The monument was irrevocably destroyed, but, thanks to the vigilance of a descendant and representative of the good Regent himself, the brass was rescued and is now restored.

The Scottish brass that is probably next in chronological order is in Glasgow Cathedral. It bears to have been erected to mark the tombs of six knightly families of the noble house of Minto, and dates from 1605. It measures about 3 feet by 2 feet, and engraved on it is a figure in armour kneeling before the word "Jehovah," inscribed in Hebrew characters and surrounded by clouds and rays. In St. Nicholas's Church, Aberdeen, the same church which possesses the Irvine brass, is one in memory of Dr. Duncan Liddel, who died 1613. In the upper part of the brass is the figure of a doctor of medicine, presumably a portrait of Liddel, seated in a library, at a table, with his books and instruments around him, and the customary skull before him. In an upper corner of the brass are the arms of Liddel; argent, on a bend sinister between a mastiff's head in chief, and a greyhound's head in base couped gules, three stars of the field, and in the lower part of the plate is a Latin inscription in Roman capitals. Mr. Davidson, Aberdeen, has sent a rubbing of this brass, No. 1,133, to the exhibition. No country was ever so rich in brasses as was England. While on the Continent there are very few brasses now to be seen, England, after suffering the most extensive and protracted plundering, both official and private, can still show about 4,000. The Edinburgh Museum of Science and Art possesses a valuable collection of rubbings of these brasses, and also a few continental specimens. Owing to want of the great space required, they have not yet been permanently placed on view in the Museum; but, by the courtesy of the director and the kind aid of his staff, a selection is now shown in the Heraldic Exhibition of some of the more distinctively heraldic of them; of rubbings the details of which could most easily be seen at the necessarily lofty position there assigned to them. This selection has been arranged in an order as strictly chronological as the space available permitted. Several are of historical, as well as heraldic and artistic, interest. Take, for example, No. 1,109. This rubbing is from the brass on an altar tomb in Westminster Abbey, in memory of Alianore de Bohun, who died in 1399. She was the widow of the murdered Duke of Gloucester, the "plain, well-meaning soul" of Shakespeare, and eldest daughter and co-heiress of Humphrey, Earl of Hereford. She is in a widow's dress. Her head rests on a blue enamelled and richly-diapered cushion, which in turn rests crossways on a similar cushion in red. Cushions and tilting helms under the heads of effigies, and dogs, &c., under their feet, have a curious effect when the rubbing is hung on a wall, but appear quite natural on the original recumbent brass. From the columns of the De Bohun canopy, which is Gothic, with clustered pinnacles, hang the shields of arms which indicate her own and her husband's descent. Of these the Duke's coat, consisting of the fleurs-de-lys and English leopards of Edward III. within a bordure, will be immediately recognised. The next number (1,110) is from a brass in Warwick, which as a work of art is recognised to be "in the very foremost rank of this species of monumental memorial"—that of Thomas, Earl of Warwick, who died in 1401, and his Countess Margaret, died 1406, daughter of Lord Ferrers of Groby. "Armed at all points in the style characteristic of the stirring times in which he bore such a distinguished part, this formidable baron appears," says Boutell, "attired with splendour suited to his rank and importance." His armour and offensive weapons are all finely-wrought and richly ornamented. Over his coat of mail he wears a jupon emblazoned with his arms. These Boutell blazons as gules, a fesse between six crosses crosslet or; from the rubbing, however, they appear to be seven crosses bottonnée, three, one and three. The Countess is in kirtle and mantle. On the kirtle are her paternal arms of Ferrers, seven mascles, three, three and one; while her mantle is embroidered with the arms of her husband. "On both effigies," says Boutell, "the heraldic charges are wrought with an elaborate diaper;" in addition to which "the effigy of the knight is pounced repeatedly with the ragged staff, the celebrated badge of the House of Warwick, and his feet rest on a chained bear, another ancient cognisance of his family."

The next exhibit, No. 1,111, has an additional interest. The enamels of the knight's jupon have been restored, so that it is believed to give now a more correct idea than is afforded by most brasses in their present state of the original magnificence of these memorials. It is a rubbing from the brass of Sir William Bagot and his wife. His jupon exhibits argent between three martlets, sable, on a cheveron gules, a crescent of the first for difference. The countess, whose head rests on cushions, wears over her kirtle a peculiar garment called a sideless cote-hardi, and over both a fur-lined mantle. None of these are heraldic, but both she and her husband wear collars of SS. Sir William, who died in 1407, is best known to fame as a *persona dramatis* in Shakespeare's play of "Richard II.," and it is curious to find his and his lady's effigies invested with the collar which was the badge of Lancastrian favour. It was instituted as a national order by Henry IV. (Bolingbroke), in allusion most likely to his motto "Souveraigne," but, perhaps, as the family collar previously worn when John of Gaunt was Seneschal. It consisted of golden SS either on a band of blue, or attached to each other by gold links, the ends in both cases being fastened together in front by a clasp. The collar as worn at the present day by kings-of-arms is of the latter pattern, and may be seen—No. 709 (1)—in the glass case in the centre of the same room in the exhibition which contains the rubbings.

Were the artistic aspects of brasses, their authorship, and their faithful chronicling of the minutest changes in the fashions of armour the objects of this notice, the rubbing (No. 1,112) from the brass at Little Horkesley, Essex, in memory of the Swynbornes, might furnish an admirable text. Sir Robert, the father, who died in 1391, is attired in a shirt of mail and jupon, with a camail hanging from his bascinet to cover his throat, and his sword-belt is transverse across the hips. Sir Thomas, who survived till 1412, wears instead the newly-invented cuirass and steel gorget, and his sword-belt hangs diagonally from his waist. The palettes in front of his arm-pits are enamelled with the cross of St. George. He is invested with the collar of SS, and wears no jupon to conceal the fact that he is in plate-armour. Sir Robert's sword-belt, with R. and S. alternated on it, is a good instance of initials used as a personal decoration, while on the buckle is an early example of the somewhat rare use of a monogram. The canopy, with its beautiful arches, clustered pinnacles and pendant shields, illustrates the minute acquaintance with church architecture possessed by the designers of brasses.

No. 1,113 is from the brass at Long Melford, Suffolk, in memory of Margaret Faunceyes (*d.* 1424), wife of William de Clopton. The heraldry on her costume, like that on Lady Warwick's (No. 1,110), is arranged symbolically, it is suggested, of what, in English law, is termed her coverture. On her kirtle are the arms of her maiden name—a saltire between four crosses. Covering this is her mantle, bearing the arms of her husband—a bend between two indented cotises. This fashion is abandoned in the Verney brass of the next century at Aldbury, Herefordshire (see No. 1,125), where, while the knight's tabard bears his arms alone, the lady's mantle bears them with her paternal arms of Bray, impaled. On No. 1,114, from an English brass at Hever, in Kent, the lady's head is on a cushion, supported by angels, probably in allusion to the flight of the soul. Her husband's shield is placed at the top of the slab. The practice was early adopted of separating the shield from the wearer and placing it, according to the artistic ideas of the designer, at the corner of the slab or at the top or foot, &c., as in Nos. 1,108, 1,114, 1,117 and 1,118 respectively. Sometimes, for decorative reasons, the same shield is repeated at different places, as in No. 1,113. But the plan was specially convenient when, for a genealogical purpose, more than one coat was introduced, as in the Swynborne, De Bohun, Clopton, or Neville (No. 1,128) brasses. Finally, the shield sometimes appeared alone in company with an inscription, as in the Scottish brasses before mentioned, or the Oxfordshire brass, represented by No. 1,131, which consists of two coats-of-arms,

and under them respectively only the names "Thomas Whorwood, 1634," and "Elizabeth Whorwood, 1633." Another example of a brass somewhat similar in this respect is the Strafford brass in York Minster, a rubbing of which is contributed by Mr. C. S. S. Johnston (No. 1,148).

For a long period heraldic ensigns were denied to persons engaged in trade. But merchants used trade-marks which served much the same purpose. A specimen of a mark is shown on the rubbing (No. 1,116) of the brass in which Reginald Spicer, merchant in Cirencester (*d.* 1442), appears in effigy, with his four wives standing all in a row. This mark, which is a variety of one very common among wool merchants, consists of a shield, on which lies, pale-ways, a charge somewhat like an archbishop's crozier, from the shaft of which, immediately under the cross-beam, fly two streamers towards the sinister side of the shield. Opposite, on the dexter side, is a small semicircle drawn from a centre in the shaft. At the nombril point the shaft intersects a circle, and in base a line fesse-ways couped at the ends. Spicer's initials, R.S., in old English capitals, flank the central charge, the cross and streamers of which are supposed to have been adopted in allusion to the Agnus Dei. In time, however, merchants were granted coats-of-arms, and these appear on their brasses, sometimes along with their merchants' marks, sometimes alone. The shields on the brass (No. 1,126) of Nickolas Leveson, mercer, merchant of the staple of Calais and Sheriff of London (*d.* 1539), are a good instance of this.

The humble little brass at Wimborne, Dorset, of which No. 1,118 is a rubbing, is no other than the only brass in England erected in memory of a king. It represents in half effigy Saint Ethelred, king of the West Saxons, who in 872, or, according to the inscription, 873, was martyred, "Per manus Dacorum paganorum occubuit." He is represented close-shaven, crowned and sceptred, and in tunic with close sleeves, cloak or cope, and ermine tippet—garments which signified that the king at his coronation was admitted to an office both civil and sacred in character. Underneath the inscription is a shield charged with a cross fleury. This brass, though commemorating a personage of the ninth century, is pronounced by Haines to be of fifteenth-century workmanship, with the inscription restored about the end of the sixteenth. But who can wag the head and call this tribute tardy? William Wallace was born in the thirteenth century, Herman flourished in the eighth, yet their monuments have only been erected in the latter half of the nineteenth.

The close-fitting jupon had probably been designed to contribute to the physical warmth of the warrior, whose armour consisted merely of mail. It certainly was discarded when the cuirass was introduced, and a tabard, a looser garment with short cape-like sleeves, was adopted in its place. Instances of the tabard may be seen on Nos. 1,119-21, &c. As a rule it was heraldic, with the bearings repeated four times on it, viz. on the front and back and each sleeve. In this context the tabards of the kings-of-arms, heralds and pursuivants exhibited (Nos. 141-46) in the large wall case in the same room with the rubbings may be inspected. In the mural Denys brass at Olveston, Gloucestershire, A.D. 1505 (No. 1,119), are two kneeling figures in plate armour and tabards, the charges on which are repeated on two of the four shields which are placed in the corners of the slab. No. 1,120, from a recumbent brass in Childwell Church, Manchester, represents Henry Norris, of Speke, in a tabard over his armour, and with his head resting on his tilting helm. The next rubbing (No. 1,121), from a mural brass at Thame, Oxfordshire, represents Sir John Clerk, of North Weston, died 1539; and the inscription relates that at a tourney at Bomy, in France, he made prisoner Louis of Orleans, Duke of Longueville. No. 1,124, from the brass at Hever, in Kent, in memory of the father of Queen Anne (Boleyn), Sir Thomas Bullen, Earl of Wiltscher and Ormunde, who died 1538, is worthy of notice. The brass is said to be the work of a provincial, perhaps a Norfolk, artist, a theory which, though interesting from an art point of view, does not impugn its heraldic importance. The Earl is represented in a complete suit of plate armour, with his head, on which is his coronet, resting on his crested tilting helm. Over his armour are the full insignia of the Order of the Garter, the robe with the badge embroidered on the left breast, the hood, the collar, and below the left knee the garter itself. The collar and garter may be compared with the collar and garter of the present day exhibited in the case in the centre of the room. The most obvious difference between them is the larger scale of the garter-encircled roses of the older collar. The hood appears to be very similar to that which forms part of the costume of the Order to-day.

Rubbings of the upper parts of two fine brasses which, though of English personages, have all the characteristics of Flemish work, are also exhibited (Nos. 1,127 and 1,195.) The former is from Cornwall, which, owing perhaps to its foreign trade, was rich in foreign brasses. It consists of the upper part of the effigy of a man in armour, of a date probably about 1450. On his jupon are three crescents surmounted by a bendlet. His head, which is bare, rests on what appears to be a shield richly diapered and supported by angels. The latter (No. 1,195) is supposed to be part of the brass of an abbot of St. Albans, and is pronounced by Boutell to be "the very finest specimen of this class of monument known to be in existence." The Museum contributes also rubbings from three important foreign brasses, the originals of which are in the Dom at Freiburg, Saxony. They commemorate respectively Princess Sibylla Elizabeth (*d.* 1606), wife of Duke John George of Saxony (No. 1,151); her son, Christian Albert (*d.* 1612) (No. 1,149); and the Abbess Dorothea of Quedlinburg (*d.* 1617) (No. 1,150). Their heraldic interest to us consists in the manner in which the coats-of-arms are disposed around their margins.

Modern brasses do not come within the scope of this notice; but there are such things. Some are too fanciful and some too prosaic. Still, some are good, and the art of engraving in brass cannot be said to be a lost art. In these days of church restoration, the appreciation of this ancient form of memorial appears likely to continue to revive. It still remains to be seen whether in conception or execution of new brasses the moderns will equal the ancients, but there is one office in which it is to be hoped we will excel our forefathers, both recent and remote—that of reverently conserving the remnant of the ancient brasses which has survived till our day.

COUNTY MUSEUMS.

IN a letter to the *Times*, Sir Harry Verney writes:—I desire to bring before the landowners and others interested in the welfare of Buckinghamshire, and, I venture to add, all who are willing to aid, the desirability of founding a museum and library in the county, and to make an earnest effort for that object. Sixty-four years ago I appealed to the then Duke of Buckingham, to the landowners and others interested in the welfare of the county, and was so fortunate as to obtain contributions for founding a county infirmary. Dr. Lee, of Hartwell, gave 1,000*l.*; several members of Lord Carrington's family gave each 100*l.*; Mr. Robert Ceely, of Aylesbury, contributed his invaluable medical skill and knowledge, with his urgent advice to persevere notwithstanding great difficulties; Mr. Heyward, a schoolmaster, gave his unpaid services as secretary for twenty years. Encouraged by these and other recollections of the generosity and public spirit of the county, I do not doubt that such a movement as I now advocate would, if once started, be liberally supported. Buckinghamshire is rich in historical recollections and in the number of its parish churches of great architectural beauty and antiquarian interest. Hillesden Church made Sir Gilbert Scott an architect, and the excellent work done by the Bucks Archæological Society has served to draw attention to the objects of interest in our midst. But we have no central institution or building in which historical relics can be received and preserved, or any public collection which would excite the interest of the young, or offer the means of instruction to those desirous of studying the history of their own county. Such museums have been started with great success in other counties, for instance, notably in Wiltshire. Engravings, drawings and photographs of old buildings, old county maps and descriptive books, rubbings from brasses in churches, pottery, coins, arms, relics of Roman times and the civil wars, autograph letters from old county worthies, copies of interesting old parish registers, wills and deeds, manuscripts and books illustrating the history of the county and the lives of illustrious Bucks men, would all find their fitting home in such an institution. Another portion of it would be devoted to illustrating the arts and industries of the county, from the lacemaking introduced by Queen Catherine of Aragon to the latest development of the railway industry at Wolverton, and specimens of wild animals, birds, insects and flowers, and of the various soils and minerals would there all find a place. Were such a museum established, I have no doubt that private liberality would soon cause it to be well filled. There are many treasures buried in private houses and much information known only to individuals which could thus become public property, to the great advantage of the community. The first step, that of obtaining a site and erecting a building capable of extension, is the most difficult and the most important. I mention a contribution that I shall be ready to make if funds can be collected to obtain a site and erect a building. I have myself a small collection of objects, collected by myself during journeys in various countries, which I would gladly give to a county museum, and I would also contribute a sum of money if the scheme is generally taken up.

Professor Flower, commenting on the foregoing, says:—

The letter of the venerable Sir Harry Verney deserves careful consideration, as it is of importance not only to the interesting county to which it relates (of which I am at present a temporary inhabitant), but to very many other districts of the kingdom. In a recent tour through Holland I was much struck by the development that has lately taken place in all the im-

portant towns of municipal museums, devoted solely to illustrate the history of the town and of its most notable citizens. Old portraits and pictures of buildings, plans and maps, documents, relics of battles and sieges, banners, costumes and other indications of manners and customs long passed away, standard weights and measures used at various periods, and many similar objects, all carefully preserved and well-arranged and labelled, make these museums a mine of information to the historian and archæologist. The only pity is that they were not begun long ago, before the hand of time had destroyed so much that can now never be replaced. Sir Harry Verney's suggestion goes beyond these municipal institutions, and would include also "specimens of the wild animals, birds, insects and flowers, and of the various soils and minerals"—in fact, the "natural history" of the district. This would undoubtedly give a much broader basis of interest and support. Unfortunately, in the last paragraph of his letter a sentence occurs which is quite inconsistent with the general excellence of his scheme, and shows that his public spirit and generosity have for the moment outrun the practical wisdom shown in the rest of the letter. He says, "I have a small collection of objects, collected by myself during journeys in various countries, which I would gladly give to a county museum." Here we have at once an opening for the kind of institution of which too many exist already, the appropriate inscription on the door of which would be, "Rubbish may be shot here." Not that the objects contained in them are necessarily rubbish in themselves, but that they have become so under the imperfect arrangement and in the incongruous surroundings in which they find themselves in such a place. The first element of success in a museum is that its object be definite and limited. The illustration of the social and natural history of a county affords a very practical definition and limit. To this may be added, when the circumstances are favourable to carrying it out satisfactorily, a general collection of an educational character, also strictly definite and limited in its objects, and kept perfectly distinct from the other. These principles have been for many years recognised and carried out in several important centres in this country; it might be invidious in me to mention any by name; but want of means has generally prevented their being fully developed. In these days, when enormous sums are annually spent with universal consent on almost every kind of educational object, it is strange how little is as yet thought of the powerful influence in teaching that a well-arranged museum may afford. As attention appears now to be awakening to the subject, it may be desirable to repeat the warning that I have had occasion to give elsewhere—that the building, though certainly one requisite for a museum, is in itself of no more value than a church without its ministers, or a school without its teachers. A staff of skilful and intelligent curators must also be provided. We shall never have local museums doing the work they might accomplish in the educational machinery of the country until the curatorships of such institutions, instead of being so poorly remunerated as they are at present, come to be looked upon as objects of ambition for well-educated, specially trained and cultivated men, though in writing this word I do not see why I should not add, or women.

ST. MARY'S TOWER, MANCHESTER.

THE proposed removal of the tower, which was allowed to remain when the body of the church of St. Mary, Manchester, was removed by the Corporation, has caused Mr. Waterhouse to write the following letter:—

Why should the tower of St. Mary's be doomed to destruction? If kept it would be to Manchester what the tower of St. Jacques in the Rue de Rivoli is to Paris, a memorial of the past, adding to the interest and picturesqueness of the garden which surrounds it, and a reminder in the midst of the rush and worry of to-day of the comparative calm and peace of yesterday. Manchester has unfortunately not too many of such reminders left her to conserve. Your Corporation is so proverbial for its intelligence and good sense, that I feel sure it must have some good reasons for being so unanimous in favour of the destruction of the tower; and I venture to hope it will give clear expression to those reasons when the Council meet to confirm the decision of the Parks Committee on Wednesday next, and that those reasons may be recognised as sufficient; otherwise I fear her great municipal institutions, of which Manchester is so justly proud, will suffer in the eyes of that increasing class to whom old things are dear, and, in fact, almost beyond price. It is not only that the tower of St. Mary's is in itself a stately bit of architecture, with a fine view from the top. Its structure is positively unique and mysterious, from the fact that the belfry is of a style two or three centuries earlier than the lower and upper parts of the tower, leading one to suppose that the Gothic work had formed part of some earlier pre-Reformation church. I venture to think that this element of mystery is another reason for not ruthlessly parting with the tower. My brother-architects will, I believe, find evidence in the tracery of the belfry windows of the cusps having been chiselled away, probably when the tower of St. Mary's was built, so as to bring the Gothic work a little more into harmony with the Classic severities above and below it. If my conjecture be correct that this part of the tower formed part of some earlier church, ministering to the spiritual needs of Manchester before St. Ann's or St. Mary's was thought of, what was the church and where did it stand? Probably those learned in the early history of the city could throw some light on this problem. A generous offer has, I understand, been made to relieve the Corporation from all expense with relation to the tower if it be allowed to stand for another year. Surely the Corporation will not lightly refuse such an offer.

ARCHÆOLOGICAL LAW IN ITALY.

IT will be a satisfaction to those interested in art to learn that the Minister of Public Instruction will present a new law on the subject of the tenure of works of art and antiquity. The law at present, says the *Times* correspondent, is a legacy of the past state of the Italian political organisation, each of the old states retaining its law of days prior to their union in the present kingdom. In Rome the Pacca edict is in vogue; in Florence there is another law; in Naples a decree of the Bourbons; and in the ex-Austrian States one more liberal than either of the others. The Pacca law permits the exportation of works of art only on the permission of the Government, and on payment of an export duty of 20 per cent., the authorities having the right to refuse permission in any case without the alternative obligation of purchase, while the Austrian law makes permission to export the alternative of refusal on the part of the Government to purchase. The financial straits to which some of the great families of Rome are reduced, and the injustice of forbidding them to sell the pictures which are their greatest wealth, in order to enable them to meet their obligations, have brought to light the absurdity of the system most forcibly, and a law has been drafted to correct it. This establishes a uniform law for the whole kingdom, permitting alienation and exportation of all works of art or objects of antiquarian interest which the Government, within three months after due notice by the owner, shall not have determined to purchase at a fair valuation, an export duty estimated at about 10 per cent. being levied and devoted to the purchase of such works of art as the Government shall wish to acquire. The same law provides that duplicate works of art discovered in official excavations which are not required for the completion of the national collections may be exchangeable with foreign museums and institutions.

GREEK INFLUENCE IN EUROPE.

AT the Congress of Orientalists, which was held in the Hall of the Inner Temple, M. Gennadius, the Greek Minister, delivered an address in which he said:—Greece is the one country and the Greek nation is the people which from prehistoric times to this day serves as an indispensable bridge between the East and the West. Having had their cradle in the East, and still retaining in their language, their traditions and their philosophy an Oriental background, they are nevertheless the soul and embodiment of Western thought—of that European genius which blossomed forth in them first in its most captivating beauty—that ever new and irresistible impulse which is called progress. From the moment that Greece appears on the stage of the world's history, this mighty force comes into play, actuated by the two chief traits of the Greek mind—by the sense of individuality and by the love of freedom—qualities hitherto unknown, which seem to emerge from the very soil of Greece, as the Greeks considered themselves to have sprung from the earth. Thus armed, the Greeks at once come in contact and join issue with Asia. They are the first who venture to fathom her mysteries, to unravel her symbolism and to grapple with her learning. Greece encounters Asia already mature in the development of its Eastern civilisation, and finds herself face to face with the huge power of Asiatic despotism, its barbaric glitter and its dumb and apathetic inertness. The Eastern mind generally loves to grope about in a region of dimness, is content with doubts and is mystified by religious contemplations, deeming it impious to inquire into the relations of God and man, and is filled with awe at the consideration of nature. The Greek, with the open-eyed delight of a child, faces nature boldly, and seeks to wrest her secrets from her; nature has no mystic terrors for him; he breaks her silence; and it is in Asiatic Ionia that the Greek mind first conceives the idea—diametrically opposed as it is to Eastern thought—that there are fixed laws which govern nature. Therefore "Know thyself" is the first law in life which the Greek—in opposition to the Asiatic—sets to himself; and to this law literature, arts, politics, religion itself conform. It is the watchword of a fearless intellect, the first step towards knowing the world rightly. This love of

inquiry and of positive knowledge, as opposed to the contemplation, the doubt and sluggish indifferentism of Asia, is personified by Odysseus, that truly typical Greek, who "had seen the abodes and had learned the minds of many men," who loved to wander over the world, and who delighted in his own adventures. Odysseus was the earliest of great travellers, and the boldest of explorers. Herodotus, himself an Asiatic Greek, first reveals to the world, by scientific inquiry and in a systematic history, the religious, political and artistic life of Asia and Egypt. His nine books have remained and will remain the most reliable and most complete storehouse of Oriental lore. They are the imperishable monument of the victory of the genius of Greece over that of Asia. This is not the place to refer to the struggle which Greece, from her first appearance as a nation, has continued to wage against the East, doing service as a bulwark to the West. But, when we look to the field of the arts, of politics and of religion, we find the genius of Greece takes its start from Oriental sources, only to transform its prototypes completely and soar up to all but unattainable heights. The art of Egypt, having been the outcome of a priestly domination, was an art of the dead, stillborn and conventional; size, not grace and symmetry, being its merit. That of Assyria, on the other hand, laboured under the crushing weight of a secular despotism which kept its tone low, and narrowed down its horizon. Greek art, emerging from the thraldom of Asia, was guided by the idea that reason should not be divorced from beauty, but that the beautiful should also be true to nature. With a bold yet measured grace the Greek modelled his gods, not after beasts and monsters, but after an idealised human form. In political life, again, the East had not then known a medium condition between despotism and anarchy. But the pliant genius of Greece first made the effort to reconcile the rights and the duties of the State to those of the individual. With regard to religion, the priesthood in the East overmastered every phase of social and intellectual life; the art of writing itself was a hieratic secret, and the study of literature and science belonged to the priestly office. The Greeks, having received with the alphabet their earliest mythology from Asia, soon threw off sacerdotal influence, and priesthood never constituted a caste in Greece. Although polytheism was the religion of Greece, yet her earliest poetry clearly pointed to higher religious conceptions, while her philosophy, ruthlessly overturning every mythological fiction, produced the teaching of Socrates, which falls but little short of that of Christ. Thus purged and prepared, by the application of a clear and fearless intellect to every branch of human knowledge, Greek genius was ready to render its greatest service to the world by receiving again from the East and interpreting to the West the Revelation of Christ. The Jews, the only Asiatic race which escaped despotism by adopting theocracy, were the people amongst whom the teaching of Christ could first be promulgated. But the Greek language was alone able, by reason of its inimitable subtlety, to give adequate expression to the noblest thoughts of the Christian faith. The Apostles, starting from Asia, wrote the New Testament in Greek, and the Greek Fathers, versed in the philosophy of Plato and Aristotle, expounded in an abiding manner the dogmas of Christianity. Such is the rich and imperishable legacy which the contact of Greece with the East has left to humanity, and so overspanning, universal and continuous are the benefits derived from it that we may well say with Shelley, "We are all Greeks; our laws, our literature, our religion, our art have their roots in Greece." The consideration of these questions, of the transmutation, through the agency of Greece, of Asiatic into European civilisation, forms part of the labours of this important congress, which now befittingly meets in this home and temple of the law; in this great and hospitable capital of the Empress of the Seas, whose possessions reach from pole to pole, and extend from one hemisphere to the other; who is the noble mother of many nations and the founder of flourishing states all over the East; whose mighty Asiatic Empire far exceeds in extent, riches and power the fondest dreams of Eastern potentates; and whose benign and beneficent rule confers on the world blessings even as great as those still derived from the undimmed brightness of the glory of Greece herself.

Correspondence

The Excursion of the Society of Architects.

SIR,—The success of the visit of the Society of Architects to Belgium has been so marked that it is proposed to make it one of a series to various parts of the Continent. It is difficult to understand why such specially favourable opportunities of studying architecture have hitherto been neglected by societies of practising architects. It is only for such specially-organised expeditions that many facilities can be obtained for the inspection and sketching of very many architectural works, as well as of productions of the allied arts and sciences; besides which, men in practice are naturally more discriminating than younger students as to what examples will be most valuable to them and more able to assimilate the useful matter they collect. The treasuries of domestic and civil architecture, both Gothic and Renaissance, in Belgium are by no means exhausted, in spite of the fact that one can trace the inspiration of nearly all our best modern buildings (of these classes) to this source, and the careful and copious notes and sketches made by the various members of the Society during the past fortnight cannot but have not only a powerful educational effect upon these gentlemen personally, but must also contribute to improve English architecture, especially in the provinces, which is so largely represented in the Society's ranks. Shall we be considered too sanguine if we entertain a hope, moreover, that our production in England of a vital and vigorous revival of picturesque and refined architecture may before long react upon modern continental work, which, alas! with the exception of a few notable examples, is still a lifeless art owing to their too great devotion to the spirit of classicism?—I am sir, yours faithfully, W. H. SETH-SMITH.

46 Lincoln's Inn Fields: Sept. 2, 1891.

Westminster Abbey Extension.

SIR,—When in March 1889 I ventured to propose as an unobjectionable solution of this difficult problem the construction of a cryptal chapel under the Abbey Green or vacant land north of the nave, my only difficulty in justifying the suggestion was in showing that there need be no difficulty as to facility of access, provided a staircase on the noblest scale and architectural character were allowed to form part of the design. There was some boldness in this proposition, ancient Gothic staircases being, with one or two exceptions, small, dark and inconvenient. I was, therefore, unable to get much support from Gothic examples, and had to content myself with saying, "The sufficient Mediæval authority for such a feature exists at Canterbury;" but later on (February 1891) I referred to a few other examples.

I have just met with another which, considering the period, is of such striking architectural design that I dare say you will be glad to publish a description of it. It occurs at Hexham Abbey, and consists of a stone staircase open to the south transept, which was used by the monks when they descended from their dormitory for their periodical services. As they came down, step by step, they would see the shrines and effigies of Wilfrid, Acca and other saints, the oratory of Prior Richard, the great screen painted with Death's Dance and the sculptured altar, not dimmed and darkened as we see them, but nearer to the condition in which they left the hands of the artists who embodied their thoughts in them. It still affords a coign of vantage, whence the noble proportions of this fine work of our forefathers can be conveniently surveyed.

The whole paper "On the Staircase," in *Chambers's Journal* for this month, is worth reading.—Yours truly,

Buckleigh Road, South Streatham: August 31. H. TRAVIS.

GENERAL.

Sir Henry Wood will start to-morrow for Chicago, in order to make arrangements in connection with the British Section of the World's Fair.

Mr. Holman Hunt's *Triumph of the Innocents* has been definitely secured for the Liverpool Art Gallery through the exertions of Mr. Harold Rathbone.

The Autumn Exhibition of Pictures was opened on Monday in the Manchester City Art Gallery.

The Annual Meeting of the Province of Quebec Association of Architects is to be held in Quebec on the 8th inst.

The Chelmsford Town Council have appointed Mr. G. H. Sasse, of Tendring Hundred, surveyor. There were 101 applicants for the post.

Mr. Woodall, C.E., has been appointed by the Manchester City Council engineer to carry out the arrangements in connection with the hydraulic power scheme. The execution of the works will take about fourteen or fifteen months, it is expected.

The Athenæum Club has been decorated under the direction of Mr. Alma-Tadema and Mr. Poynter. The walls of the hall and staircase are panelled with a high dado of beautifully-coloured marbles; the pillars are painted ivory white, with gilt capitals, and the panelled and arched ceiling of the hall is adorned with classical decorations, for which Mr. Alma-Tadema drew the designs. The figure of the Apollo Belvidere over the clock has been gilt.

The late Signor Benedetto Romagnani, of Pistoria, Florence, who recently died, has left to the Corporation of the City of London a legacy, consisting of "the centre of a chandelier for the saloons of vessels, composed of six parts, and decorated in the middle with the Triumph of Neptune and other ornaments."

The Architect.

THE WEEK.

An inquiry instituted by the Local Government Board has taken place in Darlington, and no doubt the inspector will advise the Board not to sanction the application of the Town Council for leave to borrow 4,000*l.* in order to expend the money on an extension of the Town Hall. The proposal is a remarkable example of the penny-wise-and-pound-foolish policy. There is no doubt the present building is inadequate for the administration of an important town like Darlington, and it will be more so as time runs on. The Town Council propose an unsightly addition of over 60 feet, and they are not quite sure whether any money will be left for the furnishing. The addition would give more accommodation to the councillors, but many of the officers would still have to put up with their present offices. It is admitted that the new building would only serve a temporary purpose, and for all we know it may be erected to convince people of the necessity of new Municipal Buildings. But 4,000*l.* is too large a sum to throw away on a structure that is to be removed. If Darlington cannot pay the interest on the money that would be needed for suitable Municipal Offices, it would be better for the town councillors to suffer some little inconvenience until the place is richer. At all events, we hope the Local Government Board will not allow an outlay of 4,000*l.* on a building that would not be worthy of a village.

A correspondent of the *Glasgow Evening News* writes:—"Three Glasgow architects—Skirving, Ewan and Robinson—are about as indignant as any men can be just now, and I will tell you why. A little while ago they were invited, as was stated in our columns at the time, to send in competitive plans for the new Glenburn Hydropathic at Rothesay, it being distinctly understood that the competition was limited to these three, and that one or other would be appointed architect. Plans were duly prepared and submitted to the directors of the Hydropathic, and it was then discovered that certain other architects had voluntarily sent in designs, without, if I am rightly informed, so much as asking 'by your leave.' The plans received were examined and considered, and finally those of one of the outsiders were adopted as the most suitable. No explanation of any kind has been offered to the three Glasgow men who entered the competition on the conditions above stated, and they may go and fetch their plans back to their offices as soon as they choose. Messrs. Skirving, Ewan and Robinson are convinced that they have been rather shabbily treated, and I am not surprised at their indignation." The grievances of competitions were numerous enough, but the Glenburn case adds a new variety which probably will be often followed. It is the more remarkable as coming from Scottish architects, who were supposed to let every man enjoy his chance.

At the Congress of Orientalists on Wednesday, Dr. J. S. Phené read a paper on the Hittite monuments. He maintained that there was every reason to suppose the figures at Nymphi were those of the Egyptian king, Rameses II., known also as Rameses the Great, and also as Rameses-Sesostris, although "Sesostris" was not found on his monuments; and was, perhaps, a family name. Dr. Phené gave his own reading of the symbols at Nymphi:—The symbols are a crouching bird on a level with the face of the victorious Sesostris, and close to it a sceptre; above it a sign frequently found in Hittite inscriptions of a staff with smaller ones on each side, which symbol he considered was equivalent to the people, *i.e.* of high and low degree; and following this a broken sceptre. The bird usually found in Hittite inscriptions, as at Jerabis, is the eagle, and the position is one of majesty, which he considered implied kingly power, and hence the crouching and humbled bird was a king bereft of his power. The metaphor was purely Oriental, and in continual use in the Hebrew writings—"a bird of the air shall tell the matter"—"mine enemies chased me like a bird"—"they shall tremble as a bird out of Egypt," meaning, clearly, escaped from the crushing power of Egypt. The broken reed or sceptre was also continually used as a sign of weakened power, so that, reading from right to left, the symbols read, the bird announces to the conqueror—"The sceptre, great conqueror, is yours;" "Great and small (*i.e.* the nobles and people) follow; the sceptre of the vanquished is broken." Several other of Dr. Phené's readings, as of the inscription on Mount Sipylus, were given, as very strongly supporting the views of Mr. Dennis as to this sculpture being the goddess Cybele and not Niobe, and Dr. Phené produced a mace procured by him in Sivas, the head of which was the same symbol as appeared in the inscription near the figure, showing the perpetuation of design even when the meaning had passed away. The author further expressed his opinion that the figures at Iasili Kaïa, &c., were older than the Assyrian sculptures, and that in them were the ideas carried out in Assyrian art, the figures standing upon the animal forms in the Hittite carvings being finally combined with the animals in the Assyrian work. Dr. Phené's attention was, however, more engaged with a remarkable Cyclopean temple on the Star mountain, near Tokat, than with the rock sculptures, which, when he visited them, were generally considered as a low class of Assyrian or Persian art. One of the most important points of this journey had been the investigation of Cyclopean buildings, and this grandly-elevated temple, which was semicircular in form, corresponded exactly with others he had found, one of which was in the centre of the island of Minorca. The one in Anatolia, which he considered was the great temple of the district, was in the locality of the most remarkable Hittite sculptures. It was on the most westerly and the largest of a number of mounds, running from east to west, in a serpentine course.

A competition among water-colour artists is to be held next year in Evreux, but it will be restricted to artists who belong to the district. All classes of work will be eligible, and it is not necessary to frame the drawings. A jury will examine the paintings, and the following prizes are to be awarded, viz. two of 100 frs. or two gold medals, five silver-gilt medals, five silver medals, twelve bronze medals. If the number of meritorious works exceeds anticipations more medals will be distributed. The competition is got up by the Société des Amis des Arts de l'Eure, and is therefore safe. The committee will endeavour to promote the sale of the drawings, charging, however, 10 per cent. for the trouble. The scheme denotes that interest in water-colours is extending in France.

The Comte de Paris could hardly exhibit himself as a litigant in France, and must accordingly sacrifice the opportunity that will soon be offered to him, and which is one that gives delight to lawyers. A nobleman of Perigord, the Marquis de Saint-Astier, was a believer in the feudal virtues, and when he died a few months ago he bequeathed his movable and immovable property save and except two classes to the Comte de Paris. The exceptions were his books and pictures, which he left to the town of Perigueux. There seems to be no difficulty about the books—nobody could consider them to be anything but written and printed pages—but the pictures at once formed a case for the lawyers. In two rooms there were altogether forty-nine, of which eleven were placed on the floor. The legal intellect immediately began to seek out some grave reason for such a disposition. It was too rational to suppose that the pictures were deposited on the floor because there was no suitable positions for them on the walls. The conclusion drawn was that the eleven pictures were not pictures, but formed part of the furniture, which was also supported by the flooring. Until the question is decided by the Comte de Paris or the courts, the eleven pictures, which are the most valuable part of the gift, will not be made over to the people of Perigueux. As there is no interest in a legal sense about the remaining works which are hung in a commonplace manner upon the walls, the legatees are indifferent to them. The affair is such a subject as would have suited that other Perigordian gentleman, Michel de Montaigne, for a discursive essay.

A BUILDING PROBLEM IN STRASBOURG.

AFTER passing beneath mountains and along the sides of them, most of the railway lines that lead to Strasbourg have to cross a vast plain, and the great spire of the cathedral is therefore visible for several miles. The building would be more symmetrical if the second tower did not terminate with the platform which is known to all visitors, but when seen from afar one spire seems to be sufficient as an indicator. It is only from some points of view that the spireless tower is perceptible, and then we can think with a fellow-feeling of Master ERWIN of Steinbach, and how much better the building must have appeared if his design had been faithfully worked out. As it is, the spire, from its great height, which is not as yet surpassed by any chimneys or towers in the city, does help us to imagine the thankfulness with which many a traveller in old days was filled at the first sight of such a beacon. He knew he was approaching a secure city, and was safe for a time at least from the land thieves and water thieves of that country. Strasbourg was more than the seat of a bishop; it might even be considered as a free city, for after many tough contests the inhabitants gained control of their own affairs, municipal as well as private.

At the present time, although the spire still points heavenwards, there is not much satisfaction visible in the faces of men whose journey to Strasbourg is coming to an end. Many of those who are natives reveal by their expression an apprehension of evils awaiting them. Who can tell whether reports of unguarded speeches may not have preceded them, or that the manner of going through the ordeal at the boundary a few hours earlier was not already recorded as a sign of disloyalty? And yet it seems incomprehensible to a stranger that any inhabitants of Strasbourg should be disaffected towards their new rulers (that is, if they could make allowance for over much display of domineering), or be yearning after French citizenship. The city, like its inhabitants, is essentially German. It was held by France for barely two centuries—for the conquest by CLOVIS in the fifth century can hardly be taken as evidence that Strasbourg should for ever form part of France. But brief as has been the French tenure, the people appear to be fascinated by it, as if it allowed an exemption from all onerous obligations.

The discontent which perplexes the relations between the inhabitants and the authorities gives a novel interest to Strasbourg at the present time. It is not enough to rule there in such a way that danger will be avoided; it is necessary to demonstrate also that the new rule brings prosperity to the people in spite of themselves. The Government must become paternal, assume novel responsibilities and initiate experiments at its own risk. There was a time when, if rigorous measures did not overcome the antagonism, many unreadable works would be produced to convince the citizens of Strasbourg that their altered condition was one of bliss. But the Germans have become too practical for that sort of reasoning, and they know that works can be far more impressive than words. Instead of hiring scribes to devise theories, they have employed builders, and are endeavouring to call a new Strasbourg into existence in order to confound the sulkiness of the old.

In consequence of so novel an experiment in government, a modern map of Strasbourg would be a surprise to any one who knew the city as it stood about twenty years ago. Like so many of the fortified places on the Continent, Strasbourg was not given to expansion. Having fortifications always around them the citizens naturally came to the conclusion that there was no safety outside their stone walls. From the time of the Romans until the thirteenth century the city did not extend beyond the island that is bounded by narrow streams, and in 1870 the size of Strasbourg was not more than double what it was in 1270. If the fortifications kept out enemies they also confined the people within narrow limits. The minds of the citizens seem also to have been kept in a state of inaction, for although the French wished to erect statues of famous natives they could only discover two, KLEBER, the general who was murdered in Egypt, and the mythic GUTENBERG. The works of SPECKLE and VAUBAN did not, however, save the city from capitulation when it was attacked under modern conditions of warfare, and it was therefore decided to provide against a siege in the uture by a new line of fortifications far outside those which the French were compelled to surrender. The area of the city in 1870 was subsequently more than doubled by means of measures that were primarily dictated by military necessity.

In England the owner of a building estate commonly begins by raising a church. The Germans started by erecting a palace for the Emperor, a group of University buildings, and various offices for administrative purposes. The sites selected were those lying nearest to the ancient town, and in course of time the Government institutions will stand, as it were, between the old dwellings and the new. In designing the buildings it was, we imagine, the aim of the architects to prove to the Alsatians that economy was a principle with the authorities. The palace is a substantial Renaissance building, but it would not satisfy a French monarch. It consists of two storeys above the ground floor. There is room in the Platz near the building for military exercises, and in order that they may be witnessed all the windows on the first floor are provided with capacious balconies. The portico is carried up to the cornice, in order that ample space may be obtained over the central entrance for the Emperor, Kings and Grand-dukes, whenever they are present, to witness military spectacles, for though Strasbourg does not form part of any of the States the whole of Germany is concerned in its welfare. The dome which surmounts the building is also turned to account for observation. It is square on plan, and the faces are in part open arches, in order to accommodate privileged spectators. The simplest peasant who visits the interior of the Kaiserpalast—it is open daily for five hours—must observe that the building was intended for public use. The part reserved for the imperial family would not be considered too luxurious for a gentleman of limited means in England. There is, however, no affectation of the asceticism which has been exhibited in the rooms of some great rulers and warriors; but if the camp-bed is absent, a plain brass bedstead from Birmingham is almost as simple. In fact, the imperial quarters are not unlike a few English rooms. The costliest parts are the salons for State assemblies, which are richly decorated with paintings that seem derived from French work of the eighteenth century. There is a general absence of the historic scenes, with figures of giants, which are so common in public buildings of Germany. The building was designed by Herr EGGERT, and, in spite of all the regard for economy, is said to have cost 250,000*l*. The University buildings are separated from the palace by the river. They are in better style. It was not necessary to break the repose of the architectural lines by escutcheons and other emblems of greatness, which are too plainly additions from without. The principal hall is of two storeys, all the windows having arched heads. Those on the first floor are separated by half-round Ionic pilasters. The frontage is about 400 feet in length. The central part and ends slightly project, and are carried somewhat higher than the remainder, but evidently it was desired that the length of the façade should be manifested. The building, which is the work of Professor WARTH, is admirably adapted for its use in connection with the administration of a modern university. The ancient universities taught the world by means of grammar, rhetoric, logic and mathematics. The new Strasbourg University has also four faculties: theology, law, philosophy and natural science. But as mathematics was made to include astronomy, music, arithmetic, geometry, natural science at Strasbourg will deal not only with chemistry, physics, geometry, &c., but with physiology, pathology and various other subdivisions of medical science. Chemistry, physics, botany, astronomy are followed in detached buildings in a pleasant garden. It was characteristic of German government that immediately Strasbourg ceased to be French the organisation of a university was commenced.

Near those buildings are others belonging to companies (the "Germania" Assurance Offices being the most important) and individuals, which denote an intention to make the new Strasbourg worthy of the Empire. But public and private buildings cover only a small part of the ground that has been added to the city. The greater portion of the new region lies unused. Roads are marked out, and a building scheme has been completed, but it is no easy busi-

ness to attract the class of people who are willing and able to erect houses. When the state of feeling in the city is considered, it will be evident that time must elapse before the prejudices of the subjects are overcome, for there is not only dislike of the new Government, but, from being so long cooped up within narrow limits, the citizens are no longer enterprising. German officials who would be glad to possess comfortable houses are too poor to pay builders, and Strasbourg has not enough attractions or advantages to allure emigrants from other parts of Germany.

There is, it will be seen, a difficult problem before the authorities in Strasbourg. To leave the ground unoccupied would be a sign of failure, which the Government could not well endure. To assign it to officials or to offer it as a premium for loyalty would be no less risky. For the credit of the Germans it will be necessary to let or sell the land on profitable terms, and the prospect of such a transaction is not clear to a stranger. That a population will sooner or later occupy the region is likely, for the Catholics, who are displaying much energy throughout Germany, are erecting a church which is sufficiently capacious to hold a large congregation. Meanwhile the rulers have to ponder over the difficulty of finding a sufficient number of comparatively wealthy people to occupy some square miles of building sites—a difficulty that is not lightened by the co-operation of the inhabitants of the city.

It is desirable that the ground will not be left in its present state; but when it is covered with new buildings it is to be hoped the inhabitants of the older city will not be inspired with a passion for renovation, in order to make their buildings compete with the latest erections. To Berlin architects the irregularities of the old Strasbourg houses, with their mountainous roofs, must be painful; but as the experiments to modernise the town have failed in the past, it would be wise to allow the houses to retain their primitive character.

ACHIEVEMENTS IN ENGINEERING.*

A SERIES of volumes recording the most important events of the last half-century would be incomplete if nothing was said about the difficulties which have been overcome by civil engineers. Peace hath her victories as well as war, and interesting as the campaigns in the Crimea, Afghanistan, India, Italy, France and America can be for writers and readers, no less courage and skill were displayed in many engineering works. In Mr. VERNON-HARCOURT'S volume, contests are described which at first seemed to be doomed to failure if the men who took part in them had not possessed that determination to run great risks which is expected in all who form a "forlorn hope." It is said to be erroneous to describe the efforts of engineers and contractors as fighting against nature, for ends are gained only by compliance with natural laws; nevertheless, it is true that the compliance or obedience can only be shown in the overcoming of obstacles.

There is hardly a work described in Mr. VERNON-HARCOURT'S book which was not marked by difficulties. In the London Metropolitan railways, which are described in the first chapter, they appeared at almost every yard. Without constant attention, the houses contiguous to the lines would have settled, and the damages were sure to be assessed at an amount that would surely bring the companies into liquidation. That most useless of statues, the *William IV.*, which, without any loss to art, could be relegated to Wapping, is an example of what became necessary in dealing with London streets. With the pedestal it weighs 160 tons, and, as interference was not allowable, the statue had to be underpinned until the line was constructed beneath it. Sewers and other conduits required careful treatment. At Sloane Square a sewer 9 feet in diameter is carried across the upper part of the station, and the beating of the pumping-engine is to be heard. The Fleet sewer and Middle Level sewer had also to be elevated, and along the extension from Mansion House station a new sewer was constructed on each side of the railway as substitutes for one that ran along the middle of the streets.

The New York elevated railways correspond in use with the underground railways of London, a continuous viaduct being used instead of a covered way. The girders rest on wrought-iron lattice columns, placed apart at distances varying from 37 feet to 44 feet. It is said that "the boldest part of the design consists in placing a railway on the top of a narrow superstructure resting upon a single row of isolated columns only $1\frac{1}{4}$ feet by $1\frac{1}{2}$ feet wide, placed 44 feet apart, along the curb on each side of a crowded roadway, and then allowing trains to run constantly at a speed of eighteen miles an hour along this open, unprotected track, which has a maximum width of 8 feet at the top." The cost per mile was 81,000*l.*, but there was nothing paid for the right to set up the columns in the streets, and no compensation was given to the owners of such houses as the railway passes in front of the first floor windows. The underground railways in London cost about 575,000*l.* a mile, but every inch of ground had to be paid for at exceptional prices.

The second chapter treats of the railways across the Alps, Rocky Mountains and Andes. On some of these lines gradients from 1 in 40 to 1 in 25 are employed, and curves are passed over which are 14 chains in radius. These figures show a wide departure from early practice, when "it was considered expedient and generally found practicable to adopt in most places gradients rising not more than 1 foot in 300 or 400 feet of length and curves having radii of little less than one mile." Ordinary locomotives can now be built which will work on lines with a gradient of 1 in $12\frac{1}{2}$ and curves of $3\frac{1}{2}$ chains radius. One of the most remarkable of steep railways is that connecting Lima with Oroya, which stands on the Andes at a height of 12,178 feet. After describing a part of the route and the difficulties encountered, Mr. VERNON-HARCOURT gives the following account of another section:—

> Mantucana, which is reached at $62\frac{1}{4}$ miles from the coast, is only 27 miles from the summit of the railway in a direct line; but a devious course of $42\frac{1}{4}$ miles has to be traversed to overcome the difficulties of the ascent without exceeding the gradient of 1 in 25. At this part of the line, about half-way up the ascent, the cliffs encountered on the route are so precipitous that workmen had to be lowered by ropes from ledge to ledge, cut out of the side of the cliff, till the railway level was reached. The engineers, also, had to be conveyed from one side of the deep ravines to the other in slings hung to a wire cable stretched across at the top. In the distance of 15 miles between Tambo de Viso and Anchi, the railway passes through twenty-two tunnels, and, between Anchi and San Mateo, the Los Infernillos cañon has to be crossed where the river Rimac passes between cliffs of red porphyry rising perpendicularly to a height of 1,500 feet. The railway on emerging from a tunnel through one of the cliffs traverses a bridge spanning the chasm at a height of 165 feet above the bed of the river, and then enters a tunnel through the opposite cliff. The loops and zigzags are sometimes so frequent that, at Chicla, five parallel lines, three on one side and two on the other side of the gorge, are visible, rising one above the other to a considerable height, whilst the greatest horizontal distance between them does not exceed 500 feet. The head of the Rimac gorge is surrounded by such precipitous cliffs that the railway has to traverse them by means of seven tunnels, and then proceeds, through a desolate snowclad region, to the summit tunnel, 3,847 feet in length, which pierces a narrow ridge.

Several other remarkably steep railways are described in the volume. Mr. VERNON-HARCOURT takes much pains to explain the "Abt Rack system," which is one of the latest devices for reaching high points. In the Hartz Mountain Railway it is used on gradients of 1 in 16, in Venezuela on gradients of 1 in 12, and upon the Visp to Zermatt line on gradients of 1 in $8\frac{1}{3}$. The economical importance of such a system is manifest.

A chapter is devoted to tunnelling through mountains, as exemplified in the Mont Cenis, St. Gothard and Arlberg works. Subaqueous tunnelling is next noticed, and England possesses striking examples in the Thames Tunnel, the Mersey Tunnel and the Severn Tunnel. The last-named required thirteen years for carrying out the work, and was several times on the point of being inundated by the sudden and unexpected influx of torrents from concealed springs. On one occasion the works were submerged for a year. It was found necessary to provide machinery that would raise 66 millions of gallons of water daily.

The history of bridge construction occupies a large part of the volume. In 1850 the world was amazed when STEPHENSON placed two rectangular tubes of 459 feet span across the Menai Straits. The Brooklyn Bridge has one span of $1,595\frac{1}{2}$ feet, and two side spans of 930 feet. In the Forth Bridge there are two openings of 1,700 feet each. If

* *Achievements in Engineering during the last Half-Century.* By L. F. Vernon-Harcourt, C.E. London: Seeley & Co., Limited.

the proposed Channel bridge were constructed, there would be openings in mid-channel of 1,640 feet. The use of beams with webs such as were used in the Britannia and Victoria Bridges by STEPHENSON are no longer approved. Lattice girders of a variety of forms superseded them. Then there was a revival of the suspension principle, and the Brooklyn Bridge shows its capabilities for great lengths. Finally the cantilever principle was developed, and as employed in the Forth Bridge its success becomes unquestionable. The conclusion which Mr. VERNON-HARCOURT comes to in respect to future work is thus expressed:—

> There is no prospect at present of the discovery of any metal stronger than steel, and equally cheap, nor is there any known untried principle available for still larger spans. With our present knowledge, therefore, the suspension system or cantilevers seem likely to be resorted to for bridges of unusual span, whilst continuous girders of varying depth appear capable of being extended to greater spans than girder bridges have hitherto attained.

The chapter on Submarine Mining and Blasting contains an account of the removal of the reefs in one of the channels leading to New York Harbour known as Hell Gate. Then follow chapters relating to harbours, river improvements, canals and other works connected with navigation. The greater part of the book is necessarily occupied with works which are required for facilitating communication between towns and countries, which is the main purpose of the profession of civil engineering. Afterwards the new Liverpool waterworks are described at length, and finally something is said about high towers and lighthouses.

The volume is a successful attempt to popularise the knowledge possessed by civil engineers, and acquaintance with the pages would be advantageous to all people. It would be better if the author had given the names of the contractors who carried out the works that are described, for their responsibility was equal to the engineers'. The ignoring of the men who realise ideas is too common in our days, but on that account it is no less unjust.

EARLY EGYPTIAN BUILDING.

THE following narrative of his proceedings in Egypt was read by Mr. Flinders Petrie at the Congress of Orientalists:—

For ten years past I have been engaged on a study of the civilisation and products of ancient Egypt. Explorers in the past have been so largely attracted by the political history and religion of Egypt that our ignorance of the development of its arts and manufactures was surprising; the anthropologic study of the country was neglected, and it is that department which I have attempted to enlarge, not solely for the interest attaching to such subjects, but to serve as a key for comprehending the history and character of ancient Egypt more completely. My last season of excavation has completed the series by a study of the most ancient period known—the third and fourth dynasties, at Medum. Before proceeding to describe the other results, it will be most proper to state the reasons for attributing the tombs of Medum to a period so distant. The system of decoration, the form of the false door, the groups of animals, the technique, are identical with the most ancient tombs known—those of the commencement of the fourth dynasty, published by Lepsius in the "Denkmäler." The titles are, with few exceptions, the same as in those tombs; and even the same family may be recognised, Snefrukhaf of Gizeh being the son of Nefermat, whose tomb is at Medum. In confirmation of this we notice the pottery of this cemetery; it is dissimilar to that of the middle kingdom or later times, but it is identical with that of the fourth dynasty at Gizeh. By all the evidence of character, therefore, it is proved that the tombs of Medum are of the commencement of the fourth dynasty—as early as any dated remains known in Egypt. To this age the Egyptians themselves ascribed them. On the walls of the temple of the pyramid of Medum are numerous *graffiti*. The most ancient of these is discoloured as the walls, and does not partake of the freshness of those of the middle kingdom, which are still white. This obscured *graffito* is probably of the sixth dynasty, or more ancient, and it adores King Seneferu. The base of a statuette found in the temple is dedicated to the gods of Tatseneferu by a woman, Seneferu-Khati, probably in a remote period. And in the eighteenth dynasty the various scribes who visited the place all agree in continuing to recognise it as the temple of Seneferu. The character of the edifice, the extreme simplicity of it, the absence of all original inscriptions, the sole use of calcareous stone, and absence of granite, basalt, and other more difficult materials, all stamp it as anterior to the temples of the fourth dynasty at Gizeh. On the complete accord of all these evidences, the decoration, inscriptions and architecture, it is impossible to doubt that we here study the most remote group of monuments yet discovered.

With the Pyramid of Medum you are probably familiar. It appears to rise in the form of a tower on the western desert, about 40 miles south of Cairo. This peculiar aspect is due to the construction being formed in successive revetments of masonry upon a central mass; a portion of these has been removed, revealing a long face of the interior structure. The primitive centre was a mastaba tomb 100 cubits square. This was continued to a greater elevation and a revetment of masonry placed around it, thus producing a step. The same process, of elevating the existing edifice and placing a new revetment around it, was continued seven times, until the outline became a step pyramid, or pyramid of degrees. The final process was the placing of a continuous revetment at one angle from the base to the summit, producing a pyramid which served as a model to future sovereigns, who constructed their pyramids in one design, without the intermediate stages of masonry. This is the last of the royal mastaba tombs, and the prototype of the royal pyramids. This is the genesis of the pyramid. The temple of this pyramid adjoins the eastern face; it is precisely in the middle, within 2 inches. It consists of a court, open to the sky, on the face of the pyramid; in this are erected two stelæ 13 feet (4 mètres) high, without any trace of inscription, and placed in the middle between these is the altar for offerings, equally destitute of any inscription or carving. A chamber opens into this court, which is quite entire, and a passage proceeds from the front entrance to the chamber. The entire edifice is complete; not one stone of the walls or of the roof has been disturbed. In what manner has such a precious example of primitive architecture been conserved through the vicissitudes of Egyptian history, especially as it is an edifice of calcareous stone, which is seized on with the greatest avidity by spoilers of all ages? I have partly traced the history of it. In the old and middle kingdom the courtyard was yet open, with sand blown into it. The visitors inscribed their graffiti in the chamber lighted from the court. In the eighteenth dynasty this was changed. The court was encumbered with fragments of the revetment of the pyramid, decomposed by two or three thousand years of exposure, mixed with sand blown in. This has blocked the opening of the chamber, which was thus left only accessible from the entrance passage, and visitors brought in pieces of papyrus plant to burn in order to view the dark chamber. They inscribed their graffiti in this age entirely in the mouth of the passage lighted by the front entrance. Towards the close of the eighteenth dynasty some persons appropriated the temple, then much encumbered above with débris, for a tomb; and a body, with beads of that period, was buried in the sand which half filled the passage. The entrance was carefully blocked with stone, and probably the débris was heaped over it to conceal it. These measures were only just in time to preserve this temple. The masons of Rameses II. destroyed the temple of Illahim and despoiled that pyramid for the stone, and they appear to have also partially despoiled the pyramid of Medum, as the débris of it was accumulated high above the temple at the time of the twenty-second dynasty, when the mass was used for a cemetery. Thus the successive attacks on the pyramid, which is the quarry of the district to this hour, have rendered the small temple more and more secure. So safe was it that when I determined to excavate for it I had to remove 40 to 60 feet depth of débris (12 to 18 mètres) in order to discover it, as there was no trace of any building visible, and it was only by the force of analogy that I conceived of the existence of a temple in that situation.

In the cemetery of Medum I opened a great number of tombs of the fourth dynasty which were entirely intact. These contained no ornaments or objects, excepting rarely some pottery or a wooden head-rest, but I obtained thus a series of entire skeletons of this period, which are now being prepared at the College of Surgeons, and will provide an anatomical study of importance for ethnology. The peculiar mode of interment of the greater part of these shows that a religious difference then existed. The bodies of the highest class or race were interred extended at full length, and accompanied by vases of stone or pottery and head-rests. But, on the contrary, the greater part of the bodies were interred contracted, with the knees drawn up to the breast, even where the chamber was quite sufficiently long to deposit them extended, and there is no trace of mummification. Although many of these tombs were expensive, being cut in the rock to a depth of 30 feet or 40 feet, yet in hardly any instance was any pottery discovered, only one or two of the smallest and roughest vases in one tomb. That this treatment was not due to neglect we see from the care an regularity with which the deceased are placed. The head is always to the north, the face to the east, the body lying on the left side. Such essential differences in the mode of interment and the provision for the deceased point to a difference of race. And it seems probable that the contracted interment is due to

the prehistoric race of Egypt, while the dynastic race nterred the bodies extended and with a provision of vases, &c. The skeletons were well preserved, but tender and friable; the bones lay in their places, and the linen cloth wrapped round the body was intact. Rheumatic disease and other maladies of the bones were already well known at that period. One of the largest mastabas has demonstrated to us the very correct and elegant method by which the Egyptians delineated the foundation of their edifices when the faces were not vertical. To trace the foundation of a mastaba, with an angle of 75 deg., on an irregular base, partly high, partly low, is not an easy affair. The great mastabas of Medum were pillaged while the memory of their construction remained. The attack has been by cutting a forced passage direct to the chamber, disregarding the precautions of the defence of the proper passage. In other mastabas I found that the pit to the sepulchre had been opened, while other pits which had no interment below them had been disregarded. I discovered one personage of high rank in a pillaged tomb. His head had been broken off, but was particularly replaced on a block of stone in the correct contact with the body. The process of mummification is very peculiar. After the dessication of the body it was rolled in linen, over that a covering of resin was applied and moulded into the exact form of the living person, with all the muscular and fleshy parts modelled to their natural proportion. Over this restored figure a few turns of the finest gauze were rolled. Such a method has not been seen before. The magnificent sculptured tombs here were in a pitiable condition. Left exposed to all the injuries of the natives and visitors, they have suffered far more in the last 20 years than in 6,000 years before. I have made a complete copy of them all, of the full size, and then carefully buried them completely until better times shall come for the antiquities of Egypt. These copies will be completely published on a reduced scale, and the parts that retain the colours will have them reproduced.

THE EXCAVATIONS AT POMPEII.

A CORRESPONDENT of the *Standard*, writing from Naples, says economy is the order of the day now in Italy; an order of which no one complains so long as there is reason in it. But when it comes to curtailing the endowment granted years ago by the Government for carrying on the excavations in Pompeii, it is another matter, and assuredly Signor Bonghi expresses the sentiments of all his intelligent compatriots, as also of every intellectual foreigner, in protesting against such a false economy. In a letter of the 28th ult. he addressed Signor Colombo on this subject:—

"Economy is good; but, like everything human, it has its bad side. In more than one instance we have acted like the master who, when his income was declining, ordered his cook to continue to serve him with five dishes daily, though spending ten liras a day less than formerly; but he was at liberty to make them so bad that they would be scarcely eatable. So it is, my friend, with the economy practised in ancient Pompeii, which appears all the worse because of its proximity to new Pompeii, where private individuals are as anxious to spend for the benefit of that town as the State is to economise for the former city. Originally, if I am not mistaken, Pompeii received an annual endowment of forty-three thousand liras. From this sum thirty-five thousand has been retrenched, in consequence of which the excavators, eighty and more in number, have all been dismissed at a moment's notice. At the rate at which the excavations were carried on hitherto they would not have been completed a hundred years hence, and now it is impossible to say when the work will be finished. Silence reigns more than ever in the ruins; science hopes no more; there is nothing to renew the curiosity of the foreigner. The little that remains of the endowment fund, together with the entrance-fee which I introduced in happier times, hardly suffices to save the ruins from destruction, to complete the replastering, &c., which has been carried on with such care and activity, and which alone prevents the walls from falling in and burying the mural paintings already brought to light.

"Again, the damage is more extensive than appears at first sight, since the Pompeian funds form a reserve also for all the excavatings of the south, such as the unremunerative works in Sibari, those more fortunate of Cuma, Sicola, and others. From these funds the maintenance of the edifices belonging to these provinces, of Greek, Roman and Mediæval temples, is procured. From these, also, the sum of sixty thousand liras was furnished by the foolish orders of the Ministry, in order that the German Emperor might witness the excavation of a particular object, and that others might have a copy of it. Nor was this all the expense, for the earth which had been removed with such furious haste had to be conveyed afterwards to a place where it neither injured anything nor obstructed the way. I, and others also, have often wondered at the facility and indifference with which the Government of my unhappy country overthrows habits and customs introduced by itself, and throws upon the streets people whom it has taken away from their original occupation, rendering penniless those who have enabled it to gain so much. What are these unfortunates, so peremptorily dismissed, to do now? They were but poorly paid men and women, and consequently could not put a centesimo aside. Therefore, from the moment they were turned adrift, they were reduced to beggary.

"The levelling of the ground in Pompeii is an art that not every labourer can acquire. Those who have learned it by practice, under the guidance of the superintendents, will forget it again, from want of habit. When the day comes in which my poor country has another thirty-five thousand liras to spend in the culture and research of her most ancient history, she will have to teach others the trade which she now snatches ruthlessly from those whom she herself took so much trouble to instruct. For, by reason of the poverty to which she condemns these, she cannot hope to find them again if their services should be required. I cannot say if the economy of the thirty-five thousand liras will save the Budget and solve the mystery of the deficit; but I know that it causes too much suffering, and conceals the problem of Pompeii.

"If the State cannot give the sum, the Ministry must look for it elsewhere, and I see many ways of finding it easily. But here is the evil: we Italians are sometimes afraid of getting decrepit before we have recovered our maturity. What matters about Pompeii; why trouble about such antique things? If you remind those who speak thus of the importance of these excavations to science and history, they shrug their shoulders with a pitying smile. It is useless to tell them that all the antique ruins with which the Italian soil is covered are a charge which does not belong to her alone; that it is already a disgrace to have delayed more than a century the excavations of Pompeii, to name only one ruin, and to owe to France the recovery of her perimeter. . . . But you know, Villari, that such economy is neither good nor useful for the country; on the contrary, we should seek to give her more animation, wider prospects, and help her to look far and high, and inculcate in her more elevated tastes. As it is, we ought to blush before foreigners; for we make them believe, by such acts, that we are even more miserable than we are. Our poverty appears really a disgrace to us. And yet they want money, and clamour to you for it; well, then, tell them—and, perhaps, this will convince the clowns I mentioned above—tell them that the entrance-fee which in the last ten years has given to Pompeii half a million or more, this same tax, risks being also diminished. Already one sees signs of it, and it will increase if Pompeii continues to remain silent, and to change itself from antique to old."

This protest has drawn from the Italian Government a denial, but there can be little doubt that Signor Bonghi knew what he was writing about, and had good grounds for his vigorous protest.

ASIATIC ARCHITECTURE IN POLYNESIA.

AT the Congress of Orientalists on Tuesday Mr. R. Sterndale read a paper on "Asiatic Architecture in Polynesia," from observations collected by his brother, the late Mr. Handley Sterndale. Mr. H. Sterndale spent many years in the remote islands of the Oceanic group, and made many drawings of delicate finish, though he had to draw with sharpened bullets and work up the drawings with pens of fish-bone and tint them with sepia taken from the cuttlefish. Mr. R. Sterndale said that one of the reasons why the remarkable architectural remains existing in the many islands of the Pacific had as yet attracted so little attention was the prevailing idea of their comparatively recent construction. The early people of the Carolines were builders of Cyclopean towers and pyramids, and were still very skilful in building great walls of rude stone. Though many of the Pacific islands had been peopled by accidental castaways, the settlement of the great mountain groups was effected by organised migrations of savage navigators, fighting their way from land to land, and carrying with them their families, household gods and the seeds of plants and trees. The copper-coloured autochthones of Eastern Asia spread in the course of ages to the Caroline group, and were the progenitors of the Palaos, Barbudos, Hombres, Biancos and other families of gentle barbarians. They were followed by another exodus of a kindred race, ferocious and pugnacious in the extreme and Cyclopean builders on a large scale. That these wars were frequent and destructive seemed probable from the style of their castles and strongholds, built on steep hills or surrounded by enormous trenches. That these people were greatly impressed with their religion was evident from the architecture of their temples—immense quadrangular, paved enclosures, surrounded by lofty walls and containing within them terraces, pyramids and frequently artificial caverns and subterraneous passages. Some of these structures were mausoleums as well as temples. They were spoken of by the present race of

natives as the sepulchres of the ancient deities. While exploring the mountain ranges of Upolu, at that time the theatre of a war between rival factions of Samoans, Mr. Handley Sterndale came across some stupendous Cyclopean remains belonging to the race which founded the Samoans of the present day. He found an enormous fort, in some places excavated, in others built up at the sides. This led him to a truncated conical structure about 20 feet high and 100 feet in diameter. The lower tiers of stone were very large—were, in fact, lava blocks. They were laid in courses, and in two places near the top there seemed to be entrances to the inside. It was not likely that it was intended itself as a place of defence, but rather as a base or platform upon which some building had been erected. It was no doubt the centre of a village, as many foundations of a few feet in height were near it. The Samoan natives had no tradition of what people inhabited this mountain fastness. No food-bearing trees were to be found here, and the question was on what the inhabitants used to live. The question had arisen whether Polynesian architecture was of Asiatic or of South American origin. He believed that the preponderance of evidence was in favour of the Asiatic theory. Indeed, it seemed probable that the American continent was influenced by the same migration from Asia which gave the copper-coloured races to Polynesia.

TESSERÆ.

The Marlborough House Museum.

It had long been thought desirable, both for the use of the schools and for the improvement of public taste, to form a museum of manufactures selected for their excellence in design or their skill in art workmanship, illustrative also of the history and progress of industrial art. Taking advantage of the French Exposition of National Industry at Paris in 1844, the Council at Somerset House, with the sanction of the Board of Trade, decided to expend 1,400*l.* on such examples of art-manufacture as might appear to the director of the schools calculated to benefit the students, as illustrations of applied design. The close of the Great Exhibition of 1851 affording a favourable opportunity for the further acquirement of modern examples, Parliament made a grant of 5,000*l.* for this purpose, and with this sum a selection was made by a committee consisting of Mr. Pugin, Mr. Owen Jones and the two superintendents of the Department, consisting of woven fabrics, metalwork, enamels, ceramics, wood carvings and furniture. The articles so selected were removed to Marlborough House, where they were first exhibited to the public in May 1852, together with many loans and donations from Her Majesty the Queen, His Royal Highness the Prince Consort, the Royal Commissioners of the Great Exhibition and many others, and thus was formed the nucleus of the incomparable collection now to be seen in the South Kensington Museum. At one time a prominent feature of the display at Marlborough House was a collection of carpets, chintzes, paper-hangings, porcelain, &c., purposely selected as examples of "false principles" in decoration; and this section, though entertaining enough to the public, was productive of some amount of animadversion, for it was certainly not agreeable to manufacturers to find their productions—perhaps the most profitable ones—gibbeted in the eyes of the public with the announcement that there was "want of meaning and unity in the pattern," that "the helter-skelter distribution of the lines" were like "productions under the influence of nightmare," and so forth. The names of the manufacturers were not mentioned, and in the later editions of the catalogue the more trenchant criticisms were softened down, but those who visited the exhibition will not readily forget the amusement caused by a display which was certainly somewhat invidious in its nature, and has never since been repeated.

Contractors and Architects.

The word contractor, although perhaps older in its reference to mercantile and monetary matters, does not appear to have been very frequently applied to monopolists, in building matters, before the present century. Indeed, Harris, "Hist. of Dublin," Lond., 1766, styles the architect-engineer Semple "overseer," and the builder or mason Mack "undertaker"; and Mulvany shows that in 1784 Gandon was supposed to be "a contractor," and as they termed him "a projector or undertaker"; and that the gentry of Bandon in 1795 called a contracting builder an "architect." The Reports of the Commissioners of Military Inquiry, 1806, at first style the builder "proposer," and afterwards "contractor." But except in some works for the English Government, the system was not then that which now prevails. In the seventeenth century the existence of "resident surveyors," mentioned *s. v.* "architect," as at Wollaton and Holkham, rendered the condition of master-builder precarious, if it even were possible, as a monopolist; but in the eighteenth century there was a change of practice on the part of the clients, who either preferred to have the work measured and valued (sometimes on a schedule of prices), or else employed an architect, who, as in the case of Jupp at the East India House in 1799, made his design and submitted an estimate upon which he obtained advances of money, making with the tradesmen his contracts, which, with the receipts, he produced at the termination of the works to his client; and it was customary for the latter to make a present, beyond the commission, if the works were executed within the estimate; thus 1,000*l.* is said to have been given in the cases of this building and of the gaol at Nottingham. The Irish architects, so late as 1803, practised in this manner, as Gandon appears to have done in the courts at the Custom-house of Dublin. Of course this system created a class of architects who, frequently advancing money for their patron, presented an abstract of the accounts, received a gross amount when this bill was sent in, and distributing it amongst the tradesmen, derived a discount or percentage from them; and the architect was more or less openly a builder, as he could make contracts with his client for a higher sum than those delivered to himself; the quarrels and extra charges of tradesmen following each other were avoided, and it must have been often found convenient that there should be only one creditor. Sir W. Chambers was a contractor in the erection of Parkstead at Roehampton, 1767, and his contracts for Pepper Harrow, 1775–76, still exist; a combination of positions now considered to be derogatory to the interests of the architect and his employer. As the building trade was rapidly falling into few hands, capitalists and others embarked in it, especially about 1815, and then the system of competition contracts with all its stratagems came into full force, especially after the panic of 1825, when many speculative builders found it best to work for others besides themselves. The epoch of the "division of labour" has seen all the trades connected, however remotely, with a building combined in single hands, and has commenced a system of under contracts called subletting, which cannot be sufficiently deplored on account of its attendant evils.

Spanish Renaissance.

It was first called the Græco-Romano from being a revival of the practice of those nations, and because the earliest Spanish work on the subject was entitled "Medidas del Romano." This now rare volume was first published at Toledo in 1526, by Diego de Sagredo, and contains engraved admeasurements, working plans and details taken from the edifices of classical antiquity, with rules and extracts from Vitruvius. Another and most appropriate term is La Arquitectura Plateresca, the silversmith's style, since the minute chasings and infinite ornaments recalled the elaborate works of the D'Arphes and other artists in plate, the Cellinis, in whom Spain, the mistress of the mines of Peru, was pre-eminent; and when we behold the rich chisellings of this period, lavished over marble façade and spandrel, and sparkling under a gilding sun or frosting moon, the effect is that of a plateau set out for the banquets of Olympus. This plateresque arabesque is also known in Spain as the style of Berruguete, by whom it was carried to unexampled perfection, and who has stamped the manner and epoch with his own name and impress. He was born in Old Castile in 1480, and died at Toledo in 1561; in youth he studied at Florence under Michel Angelo, and, like his master, was at once a painter, sculptor and architect; he was unequalled in sepulchral monuments and altar-screens, those retablos or reredoses for which Spain is so distinguished. The other most eminent artists of this fascinating school are Gaspar de Tordesillas, Xamete, Riaño, Diego de Siloe, Daniel Forment, Felipe de Vigarny, Villalpando, Christobal de Andino, Celma, Martin de Gainza, and the families of Covarrubias, Valdelvira and Ruiz. There is scarcely a cathedral city in Spain which does not abound in memorials of this period, when prelate and prince vied in erecting monuments which now appear disproportionate, such is the present poverty and "silence, the worst symptom a town can have." In Spain, as in the East, the time-honoured and well-selected capitals of older kings have shrivelled away, the source of their life having been cut off by the change of residence of a despot, to whose vanity, caprice and convenience they were sacrificed. The finest specimens of the Græco-Romano style exist at Toledo in the Sta Cruz, San Juan de la Penitencia, the choir and chapel de los Reyes Nuevos in the cathedral; in the cathedral and chapter-houses at Seville; in the colleges of Cuenca and El Arzobispo at Salamanca; in the chapel of San Ildefonso; at Alcalá de Henares; in the altar-screens of the cathedrals of Huesca and Zaragoza; in those neglected museums, those hitherto unworked mines of art, the cathedrals of Cuenca and Siguenza; in the cloisters of Guadalupe, Ona, Huerta, San Gregorio at Valladolid, and Lupiana near Guadalajara. The plateresque mansions are equally numerous, and it must be confessed that these gay arabesques and warlike Roman decorations are better suited to the court-yards and banqueting-halls of chivalrous magnificence than to the cloister and refectory of the monk, or the altar and tomb of the Christian priest. The Cæsars, cupids, satyrs, tritons and battle-axes mingle in-

congruously with the cowls, ropes and racks of martyrs, with the crozier and cross, emblems of peace and religion. Among the richest examples of these lay edifices may be cited the Casa del Ayuntamiento at Seville, the mansions of Monterey and Almarza at Salamanca, the archbishop's palace at Alcalá de Henares, the houses of Vargas at Toledo, of the Cobos at Ubeda, of Caraza at Seville, of Zaporta at Zaragoza, of Salicofras at Valencia, of Dusai at Barcelona. They indeed abound everywhere, sadly abandoned, by tasteless absentee proprietors, to the cobwebs of the unjust stewards, who creep like mean insects into the vacant shell of a nobler animal; on them too, however, the vials of foreign wrath have been poured out to the dregs when armed hordes bemired them as barracks. The arabesque style, too brilliant to be long-lived, arose a fashion and passed away like a meteor. It died with Charles V., whose Spanish chivalry was mingled with a Flemish, German and Italian element. Philip II., his successor, an old Castilian to the backbone, serious and bigoted in creed, pure and refined in taste, soon pruned an art which bordered on meretriciousness and paganism. The builder of the old colourless Escorial took refuge in the chaste Doric, the favourite order of his great architect Herrera, who, like his contemporary Palladio, gave his name to his style and fixed an epoch. While the Italian revelled in the beautiful Corinthian the Spaniard courted a Spartan simplicity; his cathedral at Valladolid (1585), and still more his masterpiece, the chapel of the Escorial (1563), are unrivalled triumphs of majestic breadth, unadorned solemnity and architectural proportion. Appointed by Philip the minister of public works, the plans of every building were first submitted to his approval; with him and his pupils, the Moras, the architecture of Spain came to a close, as did her greatness.

Renaissance Silversmith's Work.

When we turn from the goldsmith's to the silversmith's art we encounter a notable deficiency of specimens of household plate during the centuries preceding the fourteenth, the services of the skilful in the craft having been, to a great extent, monopolised by the Church and royalty, in whose hands, except in Italy, money had been alone allowed to accumulate. It must ever be remembered that during the Middle Ages means of profitable investment for such accumulations were altogether wanting, and that large sums were consequently devoted to the equipment of treasuries, both civil and ecclesiastical, in the most magnificent manner. This necessity can alone account for the prodigious quantity of gold and silver described in many ancient inventories—such, more especially, as that of Louis of Anjou (1360 to 1368)—a prince whose services of plate would appear quite out of proportion to his revenues but for some such interpretation. When stern necessity made some sudden demand upon the resources of such magnates, instead of selling out consols as a capitalist of the present day might do, they were compelled either to send for a Jew or Lombard, to whom they might pawn their plate, or to melt it up at once themselves. Hence it is, in a great measure, that so few remains of ancient silversmith's work, anterior to the gradual settlement of a sound financial system in the sixteenth century, have come down to our days. As trade increased and money accumulated at the great head-quarters of commerce—Florence, Genoa and Venice—the overflowings of the coffers of the merchant princes found a tangible embodiment in ornaments, utensils and implements skilfully wrought in the precious metals. The domestic luxury which had been restricted to royalty and the highest of the aristocracy was rivalled by that of the great banking families of Italy—the Bardi, Strozzi, Chigi, Medici, &c., and their correspondents, such as Jacques Cœur in France and the Fuggers of Augsburg. Not only were the tables loaded with grand drinking-cups in the various forms of tazze, hanaps, pokals, mazers, widercoms, &c., with silver plates, escuelles, dishes, spoons and magnificent salt-cellars serving for personal use, but great fancy pieces in silver, gilt, and parcel gilt were also added for pure display. Among these the most usual and important were the "terrasses," or plateaux for epergnes; the "nefs," or centre-pieces, usually models of ships; the "languiers," or tests for poison; and the fountains, or conduits, made to run with wine so long as the banquet lasted. The splendid dishes into which scented waters were poured over the hands of the guests from "aiguières," or ewers, were also very noble; and of these, as well as of the hanaps and other goblets, some very remarkable specimens have survived.

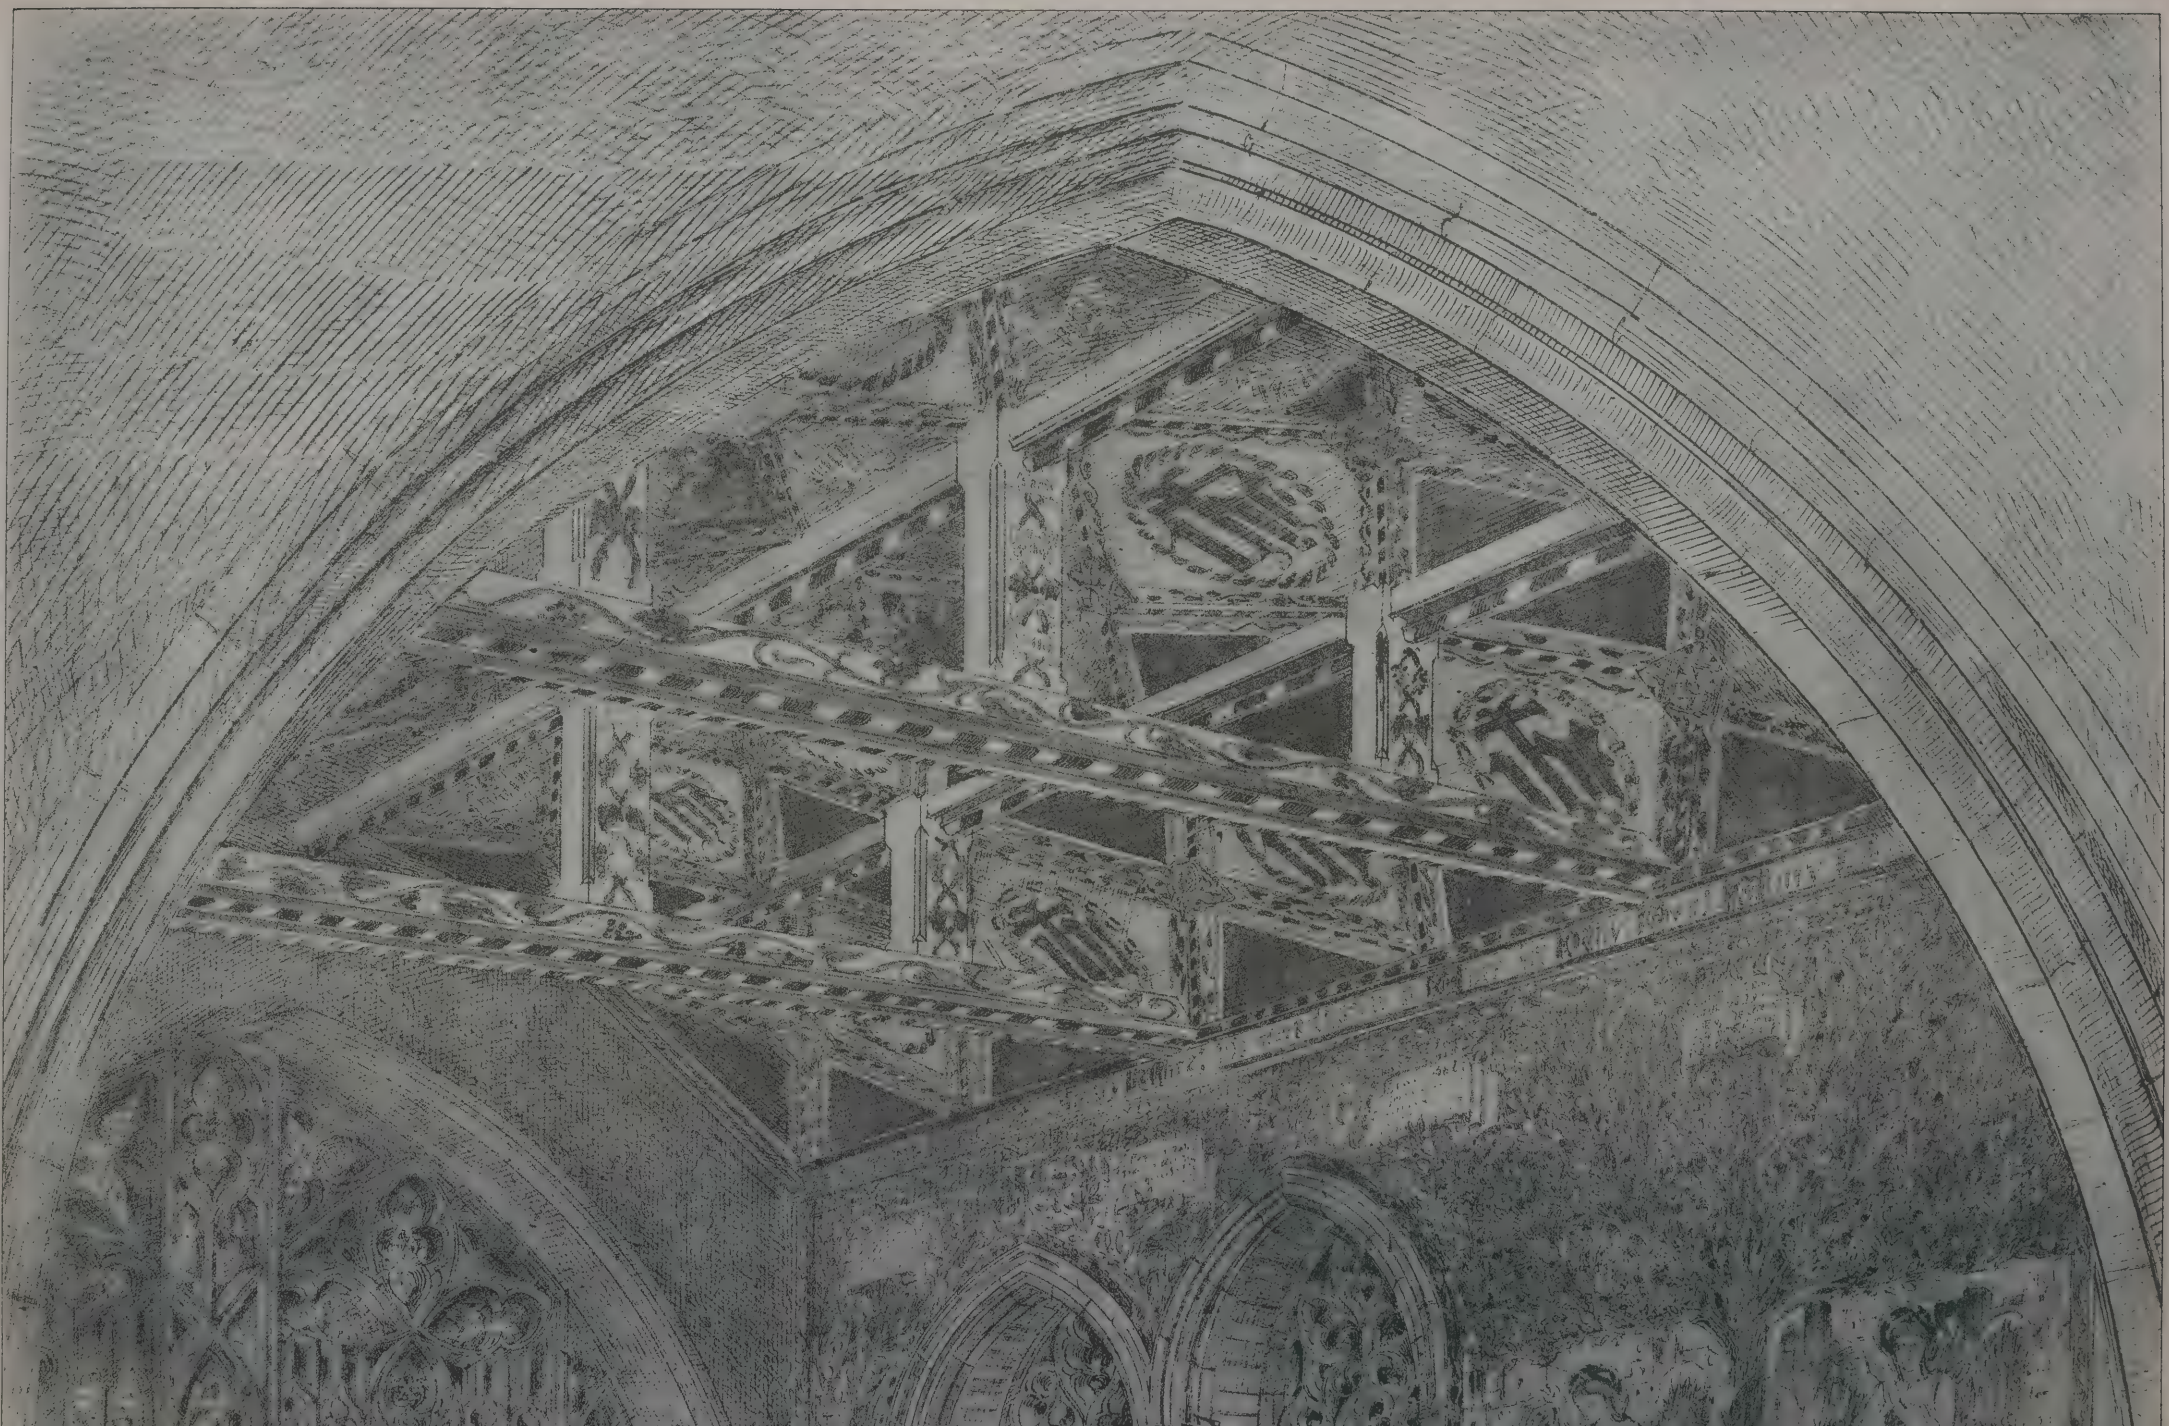
Ancient Cisterns in Constantinople.

The cistern of Jereh-Batan-Serai, or the subterranean palace, which yet exists in its original condition, contains running water brought from a great distance, and we may thus conjecture that the other cisterns were supplied in the same manner. It was formerly called Cisterna Basilica, the imperial cistern. It consists of a great underground tunnel, the arches of which are formed of brick and Khorassan mortar, supported by marble columns having capitals mostly of different orders and sizes; in other instances the capitals are smooth blocks. The bricks are inscribed with a monogram, the meaning of which is undeciphered, yet the cross which they contain places the building about the period of the middle ages. The bricks are 0·362 mètre square and 0·039 mètre thick, and are composed of a reddish substance, very fine and compact; they appear to have been much burnt, and their specific gravity is greater than that of modern bricks. The nature of the structure requiring great solidity in the arch, the Khorassan mortar between the bricks is of equal thickness to their own, and all the cisterns and subterranean conduits are built of the same component parts. The cistern Jereh-Batan receives its supply of water from the Dshebedshe-Kibi. It served as a reservoir for times of drought, and is the only one which retains its former destination, owing probably to its vicinity to the Seraglio, which it supplies with an additional quantity of water for six months subsequent to May. It is impossible to obtain an accurate idea of this cistern and its vast extent, as it is filled the entire year with a considerable depth of water and silt, but it is believed to extend as far as Sta Sophia, the mosque of Sultan Achmet, and to the Hippodrome. The cistern of Bign-Bis-Dirck, or the thousand-and-one columns, was formerly called Philoxene, in opposition to the Basilica, which was exclusively for the use of the Emperor, while the former was intended to supply the public. It is situated to the rear of the Hippodrome, on its western side, and consists of a wide, square vault of unequal sides, one being 29·23 mètres and the other 51·97 mètres long. Its roof, constructed in brick, is supported by three corresponding tiers of white marble columns; a tambour serves as a base to the upper column and for a capital to the lower one. Each row has 224 columns, placed at equal distances of 3·16 mètres, and making in all 672 columns. Those of the upper tier which support the vault alone exhibit their whole height, which is 4·39 mètres, the middle row show only a height of 2·46 mètres, the remainder, as also the entire of the lower tier, being buried in the deposit of silt and earth. A well, 4·87 mètres in depth, sunk in this accumulation, and which is supposed to reach the original bottom of the cistern, confirms the opinion as to its having three rows of columns; and consequently it would have contained 42,461 cubic mètres of water. As, therefore, the total quantity of water required for the daily use of Constantinople amounts to 9,181 cubic mètres, it would need the whole of the water which runs in the interior of the city during a space of five days to fill the cistern, and would form a reserve of nearly sixty days' supply for the use of the district to which it belongs. All the capitals of the columns are smooth, and of similar diameter and size; it would thus appear that this monument was constructed from a carefully designed plan. Some of the capitals have also crosses incised on them.

Canal Navigation.

The first important step taken with a view to apply canals on a large scale to navigation, namely, the invention of locks, is attributed to Leonardo da Vinci, towards the year 1500. Notwithstanding the importance of this invention, inland conveyance by means of canals does not appear to have been much used till the year 1612, when a Frenchman, Pierre Paul Riquet, presented Louis XIV. with a project for a canal from the Mediterranean to the Bay of Biscay, which was commenced under Riquet's auspices and at his expense. This appears to have been the first attempt to make canals a general mode of internal communication. The Belgian and Dutch canals were begun before, but not under the same difficulties. The Canal de Briare appears soon after the Canal du Languedoc; it was opened in 1642. England was far behind the Continent in canal engineering, but when once the Duke of Bridgewater had set the example, the English capitalists set on in right earnest. It is a curious fact, that while on the Continent the development of those two great instruments of progress—railroads and canals—was gradual, and can be traced rather to the increasing wants of the country than to the leading influence of any individual, in England, on the contrary, their development was so rapid as to assume the form of a mania, and that almost entirely owing to a few men, more particularly Brindley for canals and George Stephenson for railroads. The French, however, boast of their Brisson, engineer in chief of the Ponts et Chaussées, who devoted several years to perfecting some of the most important canal lines in France, more particularly the northern navigation by St. Quentin and the Oise, the canal parallel to the Somme, and those from the Rhone and Marne rivers to the Rhine. A canal cannot be too wide if it can be supplied with water. A blunder evident to all engineers was committed, both in England and in France, in giving the locks, bridges, viaducts, &c., only just width enough for the passage of one boat, so that any considerable increase in the activity of the traffic or the size of the boats will compel the canal owners to pull them down and rebuild them entirely. The idea of applying steam power on canals is as old as the application of the steamboat itself; it was tried on the Forth and Clyde Canal in 1802, but was abandoned on account of the surge caused by the paddles washing the banks of the canal. In 1812 fresh trials were made, and the banks of the canal protected by a coarse stone pitching.

NOTES AND COMMENTS.

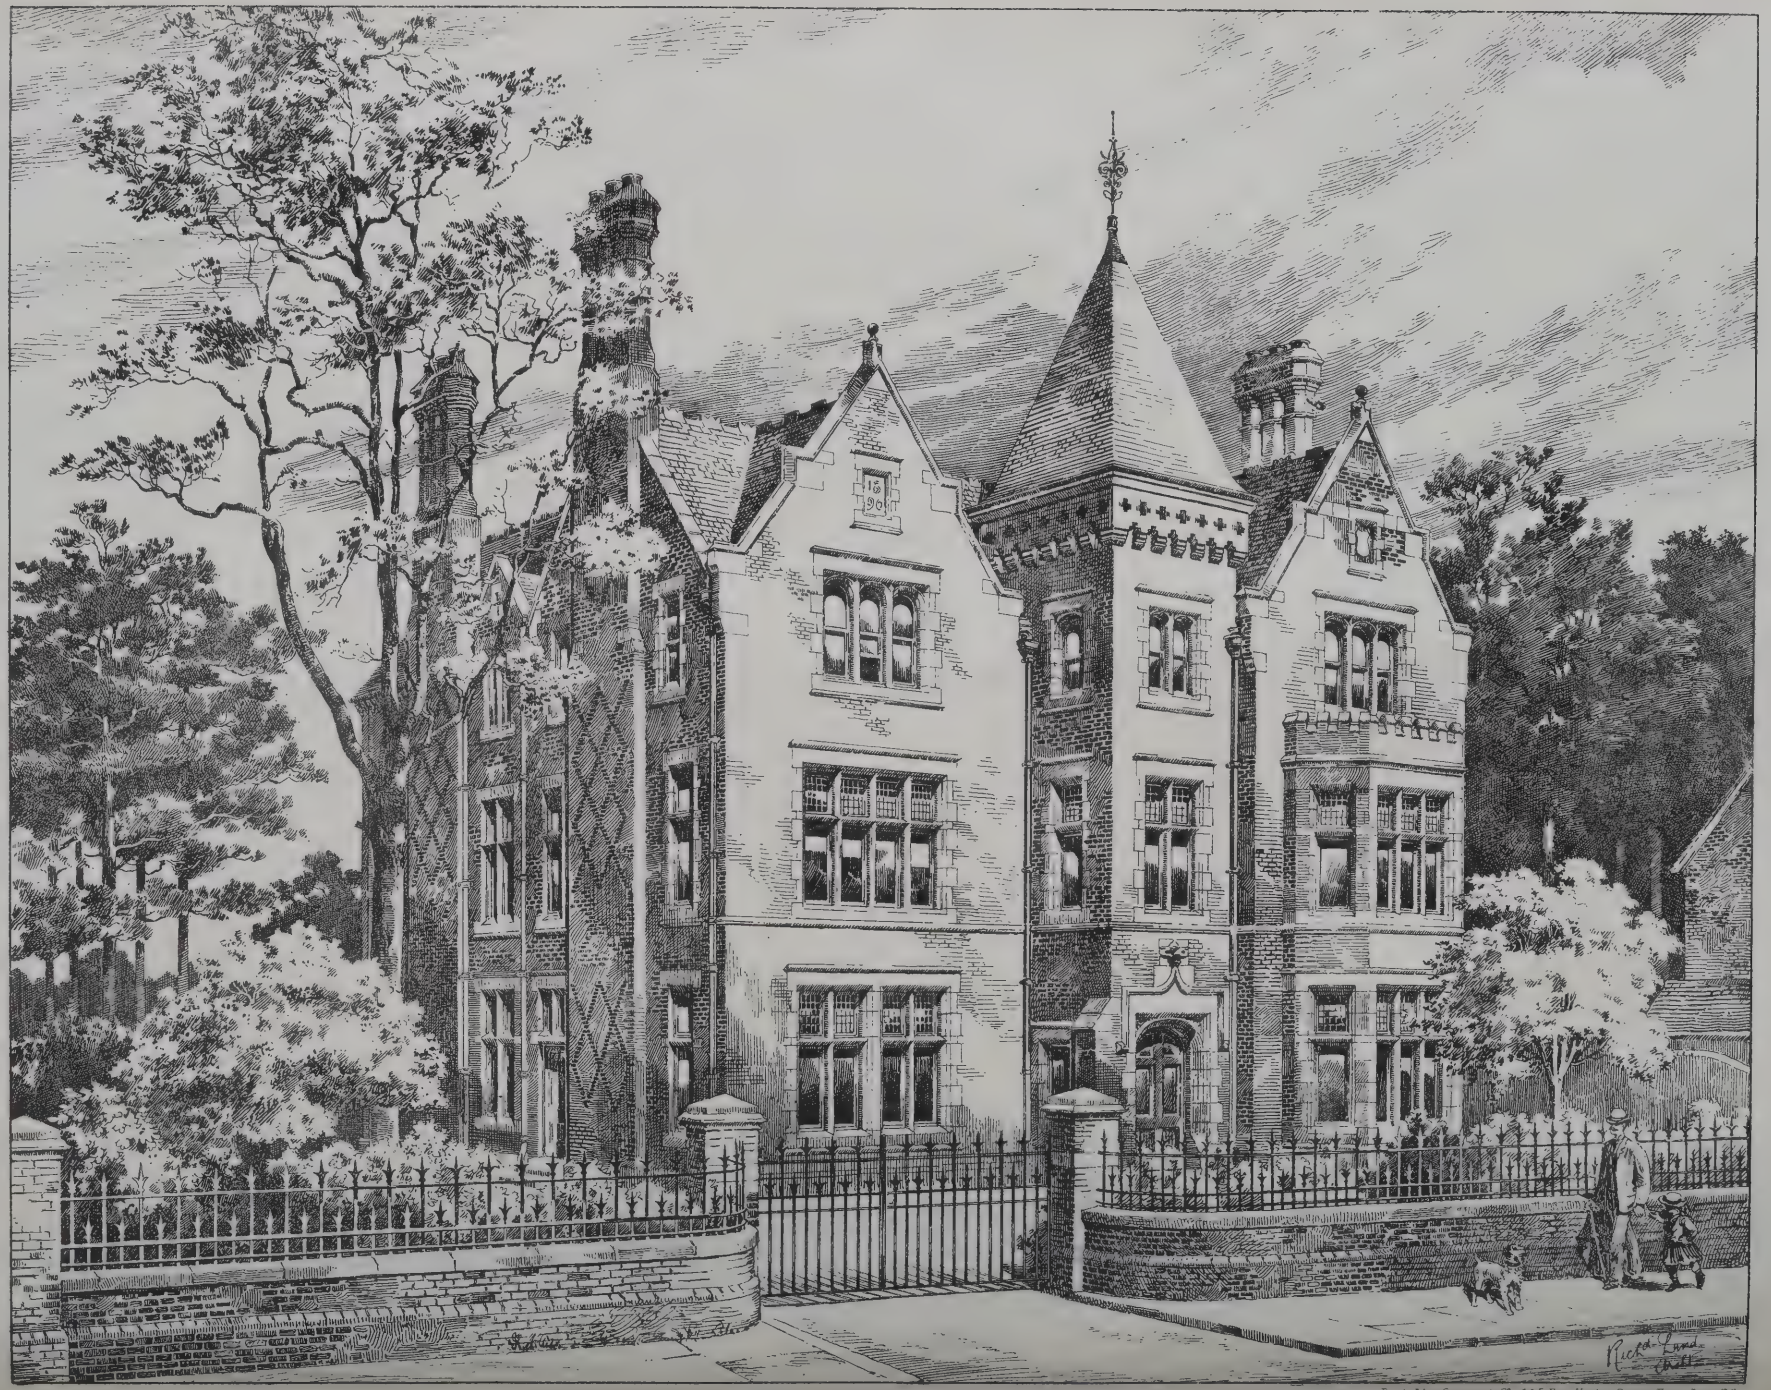


THE Romans are beginning to discover that an excess of enthusiasm is a dangerous commodity when there are memorials to erect. VICTOR EMMANUEL was too patriotic a king to desire to become an oppression to his people when he was no longer among the living, but owing to the extravagant adulation of the Italians he is doomed to increase the financial embarrassments of Rome and Italy. It will be remembered that a competition was got up for obtaining designs for a monument to IL GALANTUOMO. The first prize was gained by M. NENOT, who at the time held the Prix de Rome, and was a student in the Villa Médicis. He proposed to raise the memorial on a suitable site in the Via Nazionale, near the railway-station. But the Italians would agree to no such destination. The image of the king was to awe the world, and only one place was suitable, viz. the Capitol. Public opinion bore sway, and preparations were commenced. But the selection of the Capitol comprised the destruction of many houses, and as owners of property, however patriotic, are not prone to making sacrifices, the compulsory purchase has turned out to be a costly affair. About 350,000*l.* was voted for the memorial, including all sculpture. According to the last report over 300,000*l.* has been expended. But the property required is not all paid for, and the lower part of the monument is not as yet complete. It will be necessary to obtain more money, but the present state of the Italian Exchequer does not warrant an expenditure on monuments of any kind.

THAT Welshmen settled in Ireland from time to time seems to be unquestionable, but their residence has given rise to many of the puzzles which make Irish archæology so illusive a subject. One case is to be found in the dialect which is still to be traced in Forth and Bargy in Wexford, and which is supposed to prove that with the Welshmen were Flemings, who had previously settled in Pembrokeshire. The words and phrases sounded so strange that a century ago GROSE, the antiquary, considered the Forth speech "to be a Teutonic tongue introduced in the first age of Christianity or perhaps earlier." The dialect was considered in CROMWELL'S time to be no more than the English spoken in CHAUCER'S day. It is remarkable, however, that in all Ireland only one church is to be found which was dedicated to St. DAVID, the patron of Welshmen. It is found in Naas, county Kildare, and was visited last week by a local archæological society. There seems to be no doubt that it was erected by Welsh settlers soon after the Anglo-Norman invasion. Mr. T. DREW sees some affinity between it and Christ Church Cathedral in Dublin. Unfortunately only a part of the original building remains. In 1830 the rector invoked the aid of the Ecclesiastical Commissioners to improve the church, which they did so effectually that the aisle was removed with its prayer-desk and pulpit; an enormous structure, consisting of a lofty pulpit and expansive reading pew, was set up instead right in front of the chancel arch. The church presents some peculiarities. It is 1 foot wider at the east than at the west end, and the south wall is 2 feet wider than the north wall. The font is considered to date from the eleventh century. The tower looks venerable, but is a mere modern addition. There is an old bell in the tower which bears an inscription, "R P W C, 1674, Os meum laudabit Dominum in ecclesia S. Davidis de Naas." It is assumed that the site of the church corresponds with that of a tent in which St. PATRICK preached.

ONLY a few weeks have passed since the appearance in this journal of M. PAUL LEROI'S article in which, for the first time in England, justice was done to the surpassing merits of ELIE DELAUNAY as one of the few representatives of the grand school in France. On Saturday last the painter passed away from this world. Like so many able men of the period, he suffered from heart disease, but so sudden an ending to powers that seemed to be beyond decline was not anticipated by his family or friends. ELIE DELAUNAY was born in 1828 in Nantes. He was taught by LAMOTHE and FLANDRIN. In 1856 he won the Prix de Rome. He obtained his first medal for a picture in the Salon in 1859; others were awarded to him in 1863, 1865, 1867 and 1878. In 1889 a Grand Prix came to him in recognition of his works in the International Exhibition. He was admitted to the Legion of Honour in 1867, was raised to the rank of officer in 1878, and in 1879 he was elected to the Institut. It will be evident from the list that the great merits of DELAUNAY were not unrecognised, but all who were competent to appreciate the painter's works considered that his rewards were insufficient. Nature had endowed him with genius for art, as well as with modesty and a most delicate sense of honour; his industry was constant; his love of painting increased with years. He wanted, however, the commercial spirit, for he was too proud to sacrifice the dignity of an artist to the exigencies of the market. It might even be said that DELAUNAY was not fully appreciated until his later years, and his portrait of Cardinal BERNADOU in this year's Salon was enough to convince all who had withheld their admiration that his genius continued to be endowed with the vigour of youth. He upheld the old traditions of high art, and painted religious, mythological and historical subjects in a manner that suggested he believed in them. He was no less skilful in portraiture, and his sketches for LAFONTAINE'S "Fables" revealed skill as an illustrator. His best works are to be found in churches and public buildings.

THE Americans deserve credit for endeavouring to mitigate the evils which characterise too many competitions. According to the *American Architect*, the authorities of the State of Rhode Island have invited Messrs. HOPPIN, READ & HOPPIN, and Messrs. STONE, CARPENTER & WILSON, and W. R. WALKER & SON, of Providence; and Messrs. CARRÈRE & HASTINGS, MCKIM, MEAD & WHITE and J. C. CADY & Co., of New York; and Messrs. SHEPLEY, RUTAN & COOLIDGE, of Boston, to submit designs for a new State House in Providence. For each design, which shall be certified to by the expert architects who will assist the Commission, as complying with the conditions of competition, one thousand dollars will be paid, provided that its author shall have made no attempt to influence the decision of the Commissioners or their advisers, and that it shall appear that the probable cost of carrying it into execution will not exceed by more than twenty-five per cent. the limit of one million dollars fixed by the conditions; but the property in the plans still remains in the architects submitting them, and they are only to be used, in whole or in part, by agreement with their authors and further compensation. From the designs furnished which conform to the conditions, one will be selected which shall be presented to the general assembly of the State as the design for the new building; but this design shall still remain the property of the architect or firm who made it, and is not to be used, in whole or in part, unless such architect or firm is employed to carry his plan into execution according to the rules of the American Institute of Architects. It will be observed that the programme does not absolutely promise the execution of his plan to the author of the design selected; but, as the Commissioners are only authorised to present a plan, but not to engage an architect, they were unable to bind the State any further. It was, however, within their authority to promise that the design selected by them should not be used without proper compensation to its author, and this they have done.



A REPORT of the recent Congress of Hygiene and Demography has been issued from the office of *Public Health*. Many of the most important papers are printed in full, and careful abstracts of others are given. The volume is ample enough to satisfy most readers, and it should be possessed by all who care, on official or personal grounds, about sanitation. It suggests what is known by experience or imagined about many subjects which concern the health of individuals. Unfortunately the papers and discussions in the architectural section are suggestive of *impromptu* attempts that are inspired by willingness to oblige, and will not bear comparison with the work in the other sections. It is a pity that on such occasions some efforts are not made to uphold the reputation of the profession through essays that are expressive of practice.

HOUSE AT BEDFORD.

THIS house has been recently erected for Mr. W. H. SMITH, manager of the Bedford Gasworks. It is built of red bricks, with Doulting stone dressings, the roof being covered with Broseley tiles. The builders are Messrs. CORBY & SON, of Bedford, and the mason's work has been carried out by Mr. EDWARD STEERS, of Bedford. The architect was Mr. RICHARD LUND.

THE GLASGOW ART GALLERY SCHEME.

THE executive of the Glasgow Association for the Promotion of Art and Music have issued the conditions of the preliminary competition of architects for the proposed buildings in Kelvingrove Park. Architects are invited to submit sketch designs for buildings intended to provide accommodation for a central hall, art galleries, museum halls and galleries, a school of art, refreshment-rooms, &c. There will be two divisions of the competition—a preliminary one of sketch designs open to all, and a final one limited to those who may be invited to take part in it. It is directed that the central or music-hall should be the principal feature, its floor space being not more than 12,000 square feet; that the suite of art galleries should provide not less than 2,000 lineal feet of wall surface, in saloons measuring not more than 35 feet in width; that the museum halls and galleries should possess, if possible, 40,000 square feet of floorage, disposed to allow the spacious display of sculpture, antiquities, general art collections, technological and engineering exhibits; and that the school of art should, if possible, possess a floorage area of 12,000 square feet. The sum at disposal is 120,000*l.*, and the committee do not wish to exceed that sum. Mr. Alfred Waterhouse, R.A., has been appointed to act with the committee as assessor, and with his advice the committee will select six from the designs in the preliminary competition, whose authors will be invited to take part in the final competition. Each of the architects so invited will receive 100 guineas, except in the case of the successful competitor, whose premium shall merge in his commission of 5 per cent. for carrying out the work. All designs must be sent in by December 1 next, addressed to Mr. Waterhouse at the City Chambers, Glasgow. The day for sending in designs in the final competition will probably be March 31, 1892.

THE ORIENTAL INSTITUTE, WOKING.

THE members of the Congress of Orientalists paid a visit on Saturday, at the invitation of Dr. Leitner, to the Oriental University Institute at Woking. The Institute, of which Dr. Leitner is the director, and which was established in 1884, occupies the building and grounds formerly occupied by the Royal Dramatic College. It was founded for the purpose of providing natives of the East resident in England with the means of preserving their religion or caste while pursuing their education or official duties; and the Museum, rich in Oriental sculpture, coins and manuscripts, which is attached to the Institute, is of great value to any English student of the languages and peoples of the East. The provision for Hindoo and Mahomedan residents at the Institute has been made with the strictest regard to the requirements of Hindoo caste and Mahomedan rites; and persons of the highest caste are accommodated with a complete set of living rooms for their exclusive use. For the Hindoos a well has been sunk to the depth of 40 feet, and as many of them do not eat meat, a vegetable garden is allotted for their use. The most distinguishing feature of the Institute, however, is the mosque, which has been building for the last two or three years, and which is now completed except for some external decoration. The mosque is not a large one, but it is strictly correct in design, and combines several styles of Oriental architecture. Over the portal is to be engraved the Arabic motto, "An hour of good work is better than a year of prayer." Being the principal and almost the only place of worship for Mahomedans in this country, it attracts besides the residents of the Institute many of the Mahomedan officials resident in England; and on the occasion of the great festivals of Islam it is visited by nearly all the Mahomedans in the country.

Dr. Leitner read a paper on Græco-Buddhistic sculpture, with special reference to the examples in the museum. He pointed out that these discoveries of Greek influence in India fixed a period in the history of art, of religion and of general history. The Greek influence had refined, for it had substituted in India the representation of the noble human face and figure in place of what was supernatural or grotesque. Indian mythology, for instance, would represent our inscience by many eyes; the Greek would represent it by expression. Indian mythology would represent our impotence by many arms; the Greek would represent it by attitude, as it was represented in the sculptures which he had dug up. The question naturally arose—How did the Hindoos learn this art from the Greeks? It was known that a number of sculptors accompanied Alexander the Great on his invasion of India, and it was also known that Alexander's purpose was to inspire India with Greek objects. If this influence should appear, as it undoubtedly did, on the coins, why not also in the sculpture? As examples of what he had found Dr. Leitner mentioned a fresco, representing Buddha's temptation, whereon the virtues and vices were passing in procession followed by Greek, not Indian, soldiers; a representation of the Olympian games, which the natives themselves never played; another of the rape of Ganymedes; and a sculpture of a centaur, a creature unknown to Indian mythology. There was also a carving of a dolphin, and dolphins would certainly not be known to people living so very far from the sea. It was suggested by some that these sculptures might be of Roman or Byzantine origin. But if the influence were ascribable to commercial intercourse, it would naturally be greatest at the seaports, where, however, none of these interesting remains were found. These traces of the Greek were found nowhere but along the routes taken by Alexander, and a hundred miles to either side of these routes they ceased to exist. Dr. Leitner concluded his paper by showing, in the light of the many exhibits on the walls of the museum, how the religious motive entered into native industries and arts; and how that which seemed contemptible or ridiculous was at the very basis of all their best and most characteristic work. To root out heedlessly either the language or the religion of these native races was to ruin them industrially and destroy their possibility of continued national life.

Dr. Blau's collection of Assyrian remains was then inspected, and afterwards commented upon by Professor Oppert, who demonstrated the genuine antiquity of two objects in the collection concerning which there had been some dispute.

THE VALUATION OF LONDON.

THE last assessment of the parishes and unions of the metropolis, the second made under the authority of the London County Council, giving the basis upon which State, municipal and local taxation is raised, has this year been greatly retarded owing to the differences which have arisen between the central and local authorities. These differences have given rise to much litigation, and even now the complete lists have been issued, though in force for this year, "subject to appeals." The London County Council, moreover, is far from satisfied with the valuation system which it has inherited, and which has been in work in London since the passing of the Metropolis Valuation Act, 1869, the carrying out of which was committed to the late Mr. Jebb, the clerk of the Metropolitan Asylums Board, a body which, apart from the Metropolitan Board of Works, was the only central authority for all London when the Act was passed. This dissatisfaction of the London County Council in revising the local assessments is shown by the fact that the County Rate Committee are taking steps to bring about in London what the Council call "fair and equal assessments."

The details of the assessments so far made are of general public interest, and especially when compared with the assessments of the previous year. The "gross" is the Queen's taxes valuation, and the "rateable" the general assessment. The City of London Union, which has 109 separate parishes, together with Serjeants' Inn, Fleet Street, Thavie's Inn and Whitefriars Precinct, but excluding the Middle and Inner Temple, which are separately assessed, has a gross value of 4,889,020*l.*, and a rateable value of 4,063,211*l.*, as against 4,627,090*l.* and 3,822,571*l.* respectively last year. In regard to the other parishes and unions, the assessments are in alphabetical order and are as follows:—Bethnal Green—gross value, 519,920*l.*; rateable value, 425,504*l.*; against 498,798*l.* and 406,027*l.* respectively. Camberwell—gross value, 1,275,407*l.*; rateable value, 1,030,046*l.*; against 1,274,255*l.* and 1,032,763*l.*—a slight decrease. Chelsea—gross value, 820,669*l.*; rateable value, 689,542*l.*; against 772,714*l.* and 647,584*l.* Hampstead—gross value, 805,541*l.*; rateable value, 669,765*l.*; against 767,639*l.* and 638,811*l.* Islington—gross value, 2,025,631*l.*;

rateable value, 1,686,385*l.*; against 1,994,726*l.* and 1,651,464*l.* Kensington (St. Mary Abbott's)—gross value, 2,390,718*l.*; rateable value, 1,999,763*l.*; against 2,283,114*l.* and 1,913,523*l.* Lambeth—gross value, 1,868,224*l.*; rateable value, 1,517,810*l.*; against 1,838,826*l.* and 1,490,716*l.* Mile End Old Town—gross value, 465,931*l.*; rateable value, 377,470*l.*; against 464,056*l.* and 368,825*l.* Paddington—gross value, 1,572,323*l.*; rateable value, 1,322,982*l.*; against 1,518,471*l.* and 1,276,577*l.* Shoreditch—gross valuation, 832,296*l.*; rateable value, 682,328*l.* (the latter figures altered on appeal from 678,428*l.* rateable only); against 794,141*l.* and 644,844*l.* St. Marylebone—gross value, 1,805,500*l.*; rateable value, 1,510,051*l.*; against 1,718,802*l.* and 1,435,340*l.* St. Pancras—gross value, 1,939,968*l.* (altered on appeal from 1,931,815*l.*); rateable value, 1,609,702*l.* (altered on appeal from 1,615,915*l.*); against 1,869,987*l.* and 1,555,152*l.* St. George's-in-the-East—gross value, 233,615*l.*; rateable value, 186,826*l.*; against 230,574*l.* and 181,373*l.* The Union of St. Giles's and St. George's (Bloomsbury)—gross value, 483,229*l.*; rateable value, 403,587*l.*; against 458,121*l.* and 382,491*l.* Lincoln's Inn, which is assessed by the committee of the St. Giles's Union—gross value, 25,018*l.*; rateable value, 20,904*l.*; against 25,305*l.* and 21,149*l.* St. George's (Westminster) Union, comprising the parishes of St. George (Hanover Square), St. Margaret and St. John, and the Close of the Collegiate Church of St. Peter—gross value, 3,058,467*l.*; rateable value, 2,612,110*l.*; against 2,943,452*l.* and 2,457,837*l.* The Fulham Union (comprising Fulham and Hammersmith)—gross value, 1,176,100*l.*; rateable value, 964,806*l.*; against 1,090,812*l.* and 896,088*l.* The Greenwich Union (comprising Greenwich parish, St. Paul, Deptford, and St. Nicholas, Deptford)—gross value, 1,004,466*l.*; rateable value, 828,396*l.* (the last figures including sums for the three parishes of 9,125*l.*, 6,787*l.* and 2,200*l.* in respect to Government property, which is not assessed to "gross" value); against 969,221*l.* and 778,101*l.* The Hackney Union (which includes St. Mary, Stoke Newington)—gross value, 1,408,584*l.*; rateable value, 1,154,171*l.*; against 1,412,242*l.* and 1,141,108*l.* The Holborn Union (including St. Andrew above Bars, St. George the Martyr, Queen's Square, Furnival's Inn within and without the City, St. Sepulchre, the Liberties of Saffron Hill, Hatton Garden and Ely Rents, Staple Inn, the parishes of St. John's and St. James's, Clerkenwell, the parish of St. Luke's, Old Street, and the Liberty of the Charterhouse)—gross value, 1,278,452*l.*; rateable value, 1,050,371*l.*; against 1,251,216*l.* and 1,038,165*l.* Gray's Inn (which is assessed by the committee of Holborn Union)—gross value, 19,307*l.*; rateable value, 16,146*l.*; against 19,240*l.* and 16,067*l.* Lewisham Union (comprising Lee, Eltham and Lewisham)—gross value, 813,410*l.*; rateable value, 672,802*l.*; against 803,505*l.* and 661,589*l.* Poplar Union (including St. Mary, Stratford, All Saints, and St. Leonard, Bromley)—gross value, 923,677*l.*; rateable value, 692,705*l.*; against 904,523*l.* and 671,211*l.* St. Olave's Union (including the Southwark parishes of St. Thomas, St. Olave, St. John, Horselydown, St. Mary, Rotherithe and St. Mary Magdalen, Bermondsey)—gross value, 1,075,672*l.*; rateable value, 846,682*l.*; against 990,660*l.* and 792,199*l.* St. Saviour's (Southwark) Union (comprising the other Southwark parishes of Christ Church, St. George the Martyr, St. Saviour and St. Mary, Newington)—gross value, 1,324,854*l.*; rateable value, 1,080,190*l.*; against 1,296,214*l.* and 1,049,400*l.* Stepney Union (including the parishes of Shadwell, Limehouse, Wapping and the hamlet of Radcliff)—gross value, 371,824*l.*; rateable value, 295,248*l.*; against 377,014*l.* and 296,655*l.* The Strand Union (including St. Martin's-in-the-Fields, St. Paul, Covent Garden, the Precinct of the Savoy, St. Mary-le-Strand, St. Clement Danes and the Liberty of the Rolls)—gross value, 1,101,262*l.*; rateable value, 908,417*l.*; against 1,035,582*l.* and 864,295*l.* The Wandsworth and Clapham Union (including the parishes of Clapham, Tooting Graveney, Streatham, St. Mary, Battersea, Wandsworth and Putney)—gross value, 2,217,140*l.*; rateable value, 1,813,346*l.*; against 2,093,743*l.* and 1,689,901*l.* The Westminster Union (St. Anne's and St. James's)—gross value, 1,053,759*l.*; rateable value, 879,628*l.*; against 1,010,859*l.* and 841,952*l.* The Whitechapel Union (including the Precinct of the Old Tower Without, the parish of Holy Trinity, Minories, the Liberty of the Old Artillery Ground, the hamlet of Mile End New Town, the parish of St. Mary, Whitechapel, the Liberty of Norton Folgate, the parish of St. Botolph (without), Aldgate, the Precinct of St. Katharine and the parish of Christ Church)—gross value, 494,257*l.*; rateable value, 403,282*l.*; against 458,676*l.* and 371,189*l.* The Woolwich Union (including Charlton, Kidbrooke, Woolwich and Plumstead)—gross value, 516,569*l.*; rateable value, 481,200*l.* (including 66,803*l.* in respect to assessment of Government property); against 450,929*l.* and 351,422*l.* The Middle Temple—gross value, 17,739*l.*; rateable value, 14,782*l.*; against 18,608*l.* and 15,491*l.* The Inner Temple—gross value, 27,105*l.*; rateable value, 22,805*l.*; against 27,122*l.* and 22,697*l.* The hamlet of Penge, which is in the county of London, and forms part of the Union of Croydon, but is assessed for the purpose of the county rate, is rated at 148,799*l.*, against 150,385*l.* last year.

The total gross value of the county of London for this year is given as 39,835,700*l.*, without the Government property; and the rateable valuation, including Government property valuation, as 33,881,766*l.* Last year the gross value was 38,462,493*l.*, and the rateable value 31,592,387*l.* The rateable value of Government property in the whole is 168,190*l.*

It will be seen that the increases are general over the metropolis, and the decreases, attributable to local circumstances, very few and small in amount. The increase of this year over last year—more than 2,000,000*l.*—is a distinct advance upon the increase of last year with the year preceding, when the increase was comparatively slight. The following table shows the increases from 1874 until the transfer of this duty of issuing the assessments to the London County Council:—

Year.	Valuation.	
	Gross estimated rental.	Rateable value.
1874	£25,148,033	£20,672,765
1875	25,574,366	21,019,507
1876	27,602,649	22,763,087
1877	28,464,833	23,444,876
1878	29,027,795	23,912,681
1879	29,682,269	24,447,444
1880	30,421,071	25,057,781
1881	33,384,851	27,544,446
1882	33,855,917	27,973,978
1883	34,470,725	28,438,385
1884	35,100,704	28,954,020
1885	35,689,244	29,410,489
1886	37,027,516	30,446,336
1887	37,361,895	30,720,646
1888	37,730,300	31,005,876
1889	38,028,506	31,244,495

This table includes the last returns made by Mr. Jebb.

The County Council, in a paper sent out by the rating authorities, points out that London is the only county in England in which the central rating authority has to levy a rate upon valuations which it has no power itself to make, revise or alter. In every other county the County Council has the control of the valuations, upon which the county rate is based. In London the order of things is reversed. Instead of one assessment or rate committee there are a vast number of assessment committees, no less than thirty, appointed in the various districts by the guardians or vestries. These assessment committees revise and settle the valuation lists prepared by the overseers in their several districts, and, subject to appeals to the Sessions, the lists so settled by them are to be "conclusive evidence" of the gross and rateable value of all properties included in them, "and of the fact that all hereditaments required to be inserted therein have been so inserted," not only for the purpose of the poor-rate and of the local rates levied by vestries and district boards, but also for the county rate, and for the police and School Board rates or precepts. The London County Council therefore have no voice and no power to settle, review or alter the valuations upon which their rates must be based.

This arrangement is cumbrous, expensive, antagonistic to uniformity, and incapable of being satisfactorily grappled with by the Council under its present powers for the purpose of making "a fair and equal county rate."

Where the real rating authorities—namely, the assessment committees—are so numerous, differences in the mode of valuation will abound. The gross values are reviewed by the surveyors of taxes, but these officials have usually no technical knowledge to assist them in checking those values, and startling differences have been found to exist as the result of the varying points of view of different assessment committees. And even where the gross valuation is fair, the rateable values have been found in hundreds of cases to depart from the scale authorised by the Valuation Act. This was plainly shown by the report of the Local Government and Taxation Committee presented to the Council on January 13 last, although the case made out in that report would, in all probability, have been much intensified had not the great pressure upon the valuer's time, and the lack of proper powers to pursue his investigations, prevented him from making more than a very imperfect examination of the various lists.

The Committee, after giving a detailed report of the modes of changing the system which they suggest for the consideration of the local authorities, set forth amendments they propose in the Metropolis Valuation Act. They also say that "their object is not to increase assessments, but to bring all assessments into line with each other, so that the 67·5 of central rates should be levied equitably among the parishes all over the county."

AN ANCIENT DIVISION OF LAND.

ONE of the papers read at the meeting of the Cumberland and Westmoreland Archæological Society was on the ancient division of land known as "Rigg and Reànn," of which an example continues at Rockliffe, near Carlisle. Mr. T. Hesketh Hodgson said that the field, with its singular divisions into long strips, separated by balks or raines of turf, was an interesting survival, the only one, so far as he knew, in that neighbourhood, of a system of land tenure and cultivation which was of extreme antiquity and which had prevailed over a widely extended area. It was recognised as still existing in the east. Our Aryan ancestors carried it westward to the shores of the Atlantic, and even beyond the Atlantic traces of it might be found, for it was on record that the earliest English emigrants organised their homes in New England on the model of what we now know as the village community. Marshall, a voluminous writer on agricultural subjects about one hundred years ago, says that very few centuries ago nearly the whole of the lands of England lay in an open and more or less commonable state. Round the homesteads in which the tenants resided lay a few small enclosures or grass yards for the rearing of stock; round the hamlet lay a tract of arable fields, and in the lowest situations lay an extent of meadow ground to afford a supply of hay for the winter and spring months, while on the outskirts of the whole, or where the land was not adapted for cultivation, were the common pastures for the summer grazing of the stock belonging to the community. The arable land was laid out in great open fields, usually, though not invariably, three in number —sometimes two or four; but for the sake of brevity we will now consider only the three-field system. Each field was divided into strips of 40 rods in length and usually about four rods of 5½ yards in width, or about a statute acre, separated by ridges of turf known as balks, or locally, raines; while along the head of each series of strips ran a broad band of turf, the headland or field way, on which the plough was turned when it did not by custom turn on some other tenant's land, and which served as a road to the various strips in the fields. Corners, which from their shape could not be laid out into the usual acre or half-acre strips, were sometimes divided into tapering strips called gores or gored acres, and sometimes pieces of unused land remained which from time immemorial have been known as "No man's land," "Any man's land," or sometimes "Jack's land." These strips were allotted in rotation to a certain number of the dwellers in the townships, a very common holding being that known as a virgate, or yardland of thirty acres, in which case each holder of a virgate would possess a number of strips scattered through the open fields, ten acres in each, in apparent disorder until the key of the confusion is found in the order of rotation. These strips were not cultivated according to the will of the owner, but according to a settled rotation, fixed, by long custom, of "little grain," that is, winter crop, wheat or rye; "'etch grain" or spring crop, barley, oats, beans or pease and fallow. Turnips or potatoes, so important in modern husbandry, were then unknown. Between harvest and seedtime the cattle of the community enjoyed pasturage in common over the whole of the open fields, and during the whole of the year over the field which in its turn was in fallow. The long meadows were subject to a similar rule. They were enclosed about Lady Day for the hay harvest and assigned in similar strips, often in the rotation shifting by lot, whence they are often known as lot meadows. After Lammas the fences were thrown down and the meadows were open as common pasture until the enclosure of the following spring. The cultivation was by a common plough team, to which each holder contributed according to his holding. The full plough team was eight oxen, to which the holder of a virgate of thirty acres contributed two; the holder of a half virgate, bovate or oxgang, one. The smaller holders doubtless gave their labour towards the common cultivation. The connection of the holding with the Mediæval land measure, the carucate, or land which would be cultivated by one plough team, was obvious. The carucate, usually of virgates, was 120 acres—the acre varying in size according to the nature of the land, and so the carucate is found to vary from 80 to as much as 200 statute acres; but it is always the land which could be cultivated by one plough team, and contains always four virgates. The form of these strips was determined by long usage, which fixed the distances traversed by the plough before turning; and so invariable was this distance that it has left its mark on our language in the word "furlong," which is, of course, simply "furrow long"; while its measure of 40 rods, or 220 yards, is shown to be of immemorial antiquity by the use of the Latin word "quarrantena" for furlong. The width of the strip was determined by the day's work of the plough, which, probably by experience, was fixed at 4 rods, or 22 yards, with sufficient regularity to give rise to the measure of area which has finally settled into our statute acre of 220×22 yards, or 4,840 square yards. Probably the varying quantity, which according to the nature of the soil could be ploughed in a day, gave rise to the old local acres, which frequently differed from our present statute acre. The practice has also left its mark on our language in the word "darrick," or "day's work," which is not even yet wholly obsolete, for in 1882 an advertisement appeared in the Carlisle papers of land for sale, among which was some described as "3½ darricks in open dales"—dales, of course, meaning shapes or divisions. Doubtless the strips in the field now before them were once laid out in this manner; they would, of course, be more numerous, and be approximately of the same size; but obviously they tend to diminish in number, as whenever two contiguous strips came into the hands of the same proprietor, the "balk" or "raine" would be ploughed up and the strips thrown into one. The field was now in the hands of two proprietors only; probably ultimately the whole of the balks would disappear. The word "reine" is simply a modern German word for balk—butts or riggs, crossing the ends of the other riggs which abut upon them, the field way, the meadows, at the low end of the riggs, the common for pasture and the closes lying around the homesteads. The size of the riggs is very nearly uniform, generally one acre, but always bearing a definite relation to that measure, one, two or three roods. To us it seems a most cumbrous and extravagant system; the waste of time in getting about, the constrained rotation of crops, the difficulty in getting the land clean where it could be sown with weeds blown from the strips of a careless owner, the quarrelling about headlands and rights of way, seem to make it almost impossible of working. Yet, though there is ample evidence of the jealousies and heart-burnings to which it gave rise, there is also evidence that the enclosures necessary to amend it gave rise to much discontent and were bitterly opposed; and there appear in the schemes now put forward by certain so-called land law reformers some indications of a wish to revert to something very nearly resembling this most inconvenient and now happily obsolete form of cultivation.

LECKHAMSTEAD CHURCH.*

THE name Leckhamstead is derived from the word *lec*, a lake or marsh, and *ham-stead*. The parish is bounded on the north by Whittlebury Forest, on the east by Wicken and Thornton, on the south by Maids Moreton and Thornborough, and on the west by Akeley and Lillingstone Dayrell. Its extent is about three miles from north to south, and one and a half from east to west. Its area is about 2,800 acres, of which 733 are meadow, 1,467 pasture, 400 arable and 130 wood. In Domesday Book there are three manors in Leckhamstead, besides two subordinate estates:—(1) Held of Odo, bishop of Bayeux, by Gilbert Maminot—formerly by Earl Leuuin; (2) held of Walter Giffard, by Hugh (probably surnamed De Chastillon); (3) held by Geoffrey de Mandeville. (2) and (3) had been held before the Conquest by Suartin, Asgar's man. On the death of the second Walter Giffard, Hugh de Chastillon became tenant in chief of his land in Leckhamstead to Henry I. Meanwhile Odo's land (1) was forfeited and regranted to Geoffrey de Mandeville, the Maminot family retaining possession. And, finally, by the marriage of Beatrice de Say to William, heir of the Maminots, and his enfeoffment to Hugh de Chastillon, the three great manors came into the hands of the latter in the time of Richard I., when Hugh de Chastillon gave lands and a messuage to Luffield Priory at a quit rent of five shillings a year. The Chastillons remained lords of Leckhamstead until the reign of Richard II., when, in 1398, their estates passed either by purchase or affinity to the Guernons. Soon after 1467 Joan Guernon carried the estate by marriage to the Tilneys; and her grandson apparently, who died in 1520, left an heiress, Joan, the wife of Richard Greenway, of Dinton, whose son Anthony married the daughter, by a former wife, of Joan's second husband, Michael Harcourt, who was member for Buckingham in 1584, and died in 1594. Anthony succeeded to the estate on his mother's death in 1600, died in 1619, and is buried in the chancel of Leckhamstead Church. His son Anthony, who was joint patron with his uncle, the second Michael Harcourt, conveyed the estate to Edmund Pye and his son, who also held Bradenham Manor. His heiress married the third Lord Lovelace, whose daughter inherited the estate. Then the manor went to the Cleveland branch of the Wentworths by marriage, and Lady Ann Wentworth married Sir Henry Johnson, who died without issue in 1719. She pulled down the old manor-house, and dying in 1745, left the estate to Martha, sister to Lord Lovelace, who married Lord Henry Beauclerk. At her death the manor descended to the Rev. Henry Beauclerk, whose son, the owner of the estate and incumbent, was succeeded by John Beauclerk, of Whittlebury.

Another manor, Leckhamstead Parva, or Lymes End, passed

* A paper read by the Rev. H. C. Tompkins, at the visit of the Buckingham Archæological Society, and published in the *Bucks Advertiser*.

by fine from Hugh Mortimer, 1413, to the Tyrrells of Thornton. They built Toy Mansion in this parish in 1603, which cost 3,000*l.* Its name is still preserved in Toy Ground. In 1730 it passed to the Pollards by purchase.

Another subordinate manor, of "Heyburn Fields," was the property of the Greens till 1500, and passed from them to the Wentworths of Lillingstone Lovel, by whom it was bequeathed to Martha, wife, above mentioned, of Lord Henry Beauclerk.

The parish of Leckhamstead was enclosed in 1630. The rectory in 1291 was valued at 24 marks, and in 1534 at 15*l.* 3*s.* 4*d.* Among the rectors were (1) John Antre or Dantre, presented in 1375 by Sir Hugh Chastillon, by some identified with John Wicliffe. But according to the registers John Wicliffe, presented in 1371, died December 31, 1384, "etiam Rec. de Lutterworth." "He taught against mass, &c., tenets of ye Paptists, bred at Oxon, and drew many persons of note after him." Probably therefore as John Wicliffe never resided here, because he was also rector of Lutterworth and Ludgershall at the same time, Dantrey was his curate-in-charge. (2) In 1432 was presented Adam Molens, LL.D., *etiam Dominus huiusce manerii.* He was Bishop of Chichester in 1445, and murdered at Portsmouth in 1449. (3) October 25, 1432. Thomas Send, resigned and instituted three times. (4) November 14, 1472. Thomas Brigge, presented by Edmund Reade, Kt., and Thomas Walden. *Generoso estimato commissario fidei Guernonis* (*Anglice Feoffee*).

The church is dedicated to the Assumption of the B.V.M. The dimensions of the nave are 70 feet by 24, of the chancel 30 feet by 17, and of the aisle 70 feet by 12. The earliest church of which traces remain was built in the twelfth century, and consisted of the present nave, with a chancel eastward. But very shortly afterwards, and perhaps even before the church was finished, a north aisle or manor chapel was added, communicating with the nave by a remarkable arcade cut through the wall. Two fragments of the original painting of this church have been preserved on the piers of this arcade. One of them represents a cross, with the words—

✠ AVE MARIA; the other has Hic sedet ISABELLA,

marking the position of this lady's seat. Similar notices have been found elsewhere. This manor aisle was very probably screened off formerly from the nave by a parclose, like that mentioned in the Paston Letters, 1451. "On the Sonday before Sent Edmond, after evyn songe, Augnes Ball com to me to my closett and bad me good evyn, an Clement Spycer with her. And all that time Waryn Herman lenyd over the parklos and lystynd what we seyd."

The effigy of a knight, which lies under the western arch of the aisle, probably represents one of the Chastillons who held the manor and built this church, but it has no inscription. The mouldings of the arcade are remarkable, and especially the grotesque heads upon the keystones, each one more and more turned eastwards as it is further from the chancel. The present rood-door replaces an earlier one, of which the sill remains; there are three steps in the thickness of the wall, and the rest were of wood, descending into the aisle as at Lillingstone Lovel. The doors of the Norman church are very good; that on the north, like the aisle arches, has a head on the keystone, and one of its mouldings recalls the ornament on the font at Maids Moreton. The south door is more elaborate, with grotesque capitals above patterned columns, one of which has a head worked on the shaft below the capital; in the tympanum is a relief representing two dragons struggling over a human soul. The porch over this door was built to commemorate a visit of William Laud, then Bishop of London, in 1628.

To the Norman church already described, a tower was added in the succeeding century, and two windows were replaced in the south side of the nave; these were restored entirely in 1871. A new chancel was built in the thirteenth century with an original north door, now communicating with the modern vestry. The piscina is original, and the low rude arch near it was probably intended to cover sedilia. In the fourteenth century the tower was restored and new windows were inserted in the aisle. The font is octagonal, of Decorated workmanship, and contains in its panels:—(1) The Madonna crowned and Child under a canopy; (2) St. Catharine, though she has St. Margaret's emblems also; (3) a vine attacked by a boar, symbolising persecution, for "the wild boar of the wood doth root it up"; (4) a bishop in the act of benediction; (5) a vine with our blessed Lord's face; (6) the Crucifixion, with two mourning figures; (7) a very curious pattern of leaves and beaded bands, which seems to contain two periods of work; and (8) four small roses or ornamental studs. The tiles in the chancel are copied from one found at the restoration, with the inscription *Laus Deo*; others bear the emblematic fish and the dove. There is a peal of three bells dated 1662 and 1664, and a saint's bell, which is cracked. A brass to a member of the Tilney family (1503) lies in the aisle. In the chancel there is fixed to the north wall "a very extraordinary stone," as Browne Willis says, "and this misearebly inscribed on it—'Heare lieth Sir Anthony Greenowaye Knight. Jan. 26, 1619. He being lord of the manor in 1600.'"

Lipscomb says, "On north side, affixed to door, is a bust of wood, with features rudely sculptured; a long, ill-favoured visage, with a short beard." Might it not be a figure of John Wicliffe? No trace of it now. Lipscomb further says, "At the east end of aisle is a pew, in the middle of which is the old communion table, removed out of chancel during Protectorate of Cromwell, and ever since remaining in its present situation, being used by inhabitants at their vestries." The noticeable feature about it is that it is all pegged together, having no nails or screws. Lipscomb says there was a window in east end of aisle of two cinquefoil-headed lights, having a quatrefoil in the spandrels or subarchitrave with indented mouldings.

A clock, formerly belonging to this church, was sold to the parish of Wicken before Browne Willis's time. The church plate consists of (1) a chalice of 1569, parcel gilt, of the usual Grindal pattern; (2) a silver paten of 1789; (3) a flagon of 1793, from the same silversmith; and (4) a very beautiful silver alms dish, nearly hemispherical, with two embossed handles and an oak-leaf pattern on the bowl. There is a rare maker's mark, but no hall-mark; so the vessel is probably of foreign workmanship.

PREHISTORIC REMAINS IN SOUTHERN INDIA.

A PAPER was read at the Congress of Orientalists by Mr. F. Fawcett, on "Remains Discovered near Bellary, in Southern India." He said:—It has been known for some time that Bellary and its neighbourhood was a centre of the stone-folk. The stone of which they made their implements is there in abundance. In his "Notes on Some Recent Neolithic and Palæolithic Finds in South India" (printed in the journal of the Asiatic Society of Bengal, vol. lvi. part ii. No. 3, 1887), Mr. Bruce Foote, F.G.S., superintendent of the Geological Survey of India, writes:—"Kapgal" (a hill five miles north-east of Bellary) "had evidently been a settlement of the stone-folk for a considerable period, and an important centre of celt manufacture. The traces of residence were very numerous in the shape of small terraces revetted with rough stone walls, great accumulations of made ground full of ashes and broken pottery, and containing many implements of all sorts, a large proportion of them damaged, many so much so that they had evidently been rejected as useless. Bones of bullocks, chiefly broken, occur pretty numerously, and especially in the ashy parts of the made ground. Other traces of residence were small tanks made by damming up the little stream which drained the northern side of the hill. Large blocks of the local granite-gneiss had been hollowed for some purpose or other, and so well worn by use, or purposely fine-tooled, that the inner surface was all but polished. The signs of manufacture of implements found on Kapgal consisted of large numbers of unfinished celts in all possible states of completion, and great quantities of flakes struck off from the selected fragments of rock in the process of fabrication. The stone to be worked was procurable on the hill. It is a fine-grained pale greenstone (diorite?) which occurs here and there in irregular bands of some thickness within the mass of a huge dyke of coarse black diorite that runs along the northern slope of the hill parallel with its axis." The notes contain much valuable information, and I would refer those interested in Indian prehistorics to them.

The hill was inhabited to the summit, and all over it and in the surrounding fields may be picked up almost any number of stone implements—celts, mealing-stones, scrapers, chisels wide and narrow, pounders, corn-crushers, &c., of various excellence of finish and in various states of manufacture, but generally damaged, also quantities of broken pottery, some finely glazed. With two friends, Mr. Robert Sewell, M.C.S., and Mr. Hubert Knox, M.C.S., several excursions were made to Kapgal and Bellary Hills in June last, and in one of the first was made the discovery which it is the purpose of this paper to announce. It seemed as if all we could find in the way of relics would, after all, tell little or nothing of the habits, customs, beliefs—the life, in fact—of those who had lived on the same ground in the far-away ages; but here on Kapgal were found, most unexpectedly—for existence of anything of the kind in India was unknown—rock pictures which may give us a glimpse into their lives. They were not seen before because no European had been where they are. Crossing the trap dyke, where the rocks are piled one on the other, all the earth having been washed away by rain, I noticed a picture engraved on the perpendicular smooth surface of a rock. "Was it the work of prehistoric man?" We thought it was; and we searched and found many pictures on the rocks. At this place are terraces on the solid rock; all about are hollows in the rocks, large and small, as if they had been used for polishing, smoothing or sharpening implements, grinding corn, &c.; and there are quantities of flakes and other signs of work. Here and there is the semblance of a

picture arousing keen interest, which is completely baffled by approaching for close examination, for on going close up to it little or nothing can be seen, it being much plainer from a certain distance—15 feet to 25 feet. In two pictures we see the bow and arrow used for hunting. "How were the arrows tipped?" No stone arrow-head has yet been found in South India—not further south than Chota Nagpore. It may be they were tipped with hard wood, as are those arrows, very serviceable ones, which I got from a Kâni in Travancore. The Kânis, a pygmy Dravidian tribe of the Travancore forests, use such arrows for hunting, though they use iron for their knives and even for their fish spears, which they shoot from a bow. It is known, of course, that iron arrow-heads have been found in the cromlechs which are so common in South India. I have myself found a well-shaped one.

But as for the pictures generally and their meaning, I will hazard no theory at present, for there has been no time for their examination. It is evident that many of them are done over much older ones, which have been almost obliterated, perhaps by time. However, as it may naturally be asked, "What are the reasons for presuming that the pictures are prehistoric?" I am bound to give such reasons as I can now. They are in a place which was certainly inhabited by the stone-folk, and nowhere else. Their origin is ascribed by the Hindoo villagers of the neighbourhood to a god, Vitlappa by name, and the fact of their being appreciated as the work of a supernatural being may be taken as strong probability that they are ancient. The reasons are obvious to those who know the Hindoos. The picture representing Vitlappa may have been sacred to the prehistoric folk as it is now to the Hindoo villagers. It is the only figure about lifesize, by far the most carefully drawn, and it is on a sloping rock facing the east, so that the sun shines on it at sunrise. The head of the figure is almost covered by a patch of some hard pitchlike substance, removal of which would have offended the devotees of Vitlappa, who believe he can withhold the rain and plague them if offended. If it was sacred so too, perhaps, was the snake figure on the same rock. Seven strokes from the head tell us it represents a seven-headed snake. Snake worship, just noticed by Mr. Fergusson, is very common in South India. It pervades the religion. In the Bellary district there are numbers of snake-stones (*i.e.* snakes figured on stones) at every well, and piles of them offered by votaries at shrines and other sacred places. Like all the human figures in the pictures, Vitlappa is unclothed. This suggests that the people of the pictures were innocent of clothing, and that the picture of Vitlappa is pre-Hindoo, for no Hindoo god is represented nude. Then there is the character of the pictures—I say nothing of the fact that the animals depicted do not exactly represent any now found in that part of the country—and there are no conventional shapes. The representations of the feet-marks or impressions, though very similar to those we see in the oldest Hindoo pictures, and which are drawn or carved now as they ever were by Hindoos, and of which one form survives in the symbol painted on the forehead of the follower of Vishnu, are not quite in the conventional style. In another photograph may be seen a Nandi (Siva's bull), engraved by a modern artist almost in the conventional shape, which is the same on the old coins as in this idol made the other day. In another photograph may be seen a cart, also modern. There are many specimens of such work which imitation easily accounts for, but which cannot be mistaken for the work imitated. The modern work—probably done by mischievous cowboys—is chipped on the surface of the rock, while the older is bruised into it. The dog, hyena (or tiger?), ox, antelope, leopard, elephant—or what look like these—and other animals appear in the pictures, but no horse. We see the horse depicted in the Amravati sculptures, which are the most ancient in South India, and commonly in all Hindoo pictures. In almost every village in the Bellary district ancient heroes, represented on stones, are common objects of worship, and the chief hero is generally on horseback to express his dignity and greatness. These hero-stones are certainly old. It seems probable the horse was not known to those who made the picture. Some of the pictures, on rocks under rocks which have not been disturbed for long ages, are upside down, and some are perpendicular.

Unless we suppose they were intentionally drawn so—and we cannot—we must be inclined to the belief that they were drawn as only any rational being would draw them, and that the rocks were afterwards subverted. That there was some displacement of the rocks is most probable, for some of the pictures could not have been done were the rocks as they are now without the aid of scaffolding, and that such was used is not likely. This, too, helps to banish any probability of the pictures having been done by Hindoos, who would not take the trouble to clamber over steep rocks and put up scaffolding to bruise pictures on very hard rocks for no conceivable purpose. Such work would be aimless too, for the pictures show no facts of Hindoo life or religion. But they show, it is hoped, something of what has hitherto been behind the veil; for we can no more suppose that prehistoric man made fictitious pictures than we can suppose he made them solely for decorating his habitations. It is not possible to do more than mention the fact of the existence of most curious mounds at the foot of Kapgal, which we sectioned. In South India the investigator of things ancient has a splendid field to work in, plenty to do and plenty to get. The amateur is a fly on the Government wheel, and, however zealous, has little time for indulging his hobbies.

After the reading of Mr. Fawcett's paper, Dr. Leitner proposed, and the meeting carried by acclamation, a resolution that "a commission be formed, composed of MM. Cartailhac, Hein, Beddoe, Garson, Lewis and Brabrook, for the further investigation and prosecution in their various anthropological aspects of the discoveries made at Bellary in connection with their linguistic, ethnographical and antiquarian points of view."

ARCHÆOLOGY OF THE UTTOXETER DISTRICT.

THE Archæological Section of the Midland Institute held the last excursion of the season recently, when some of the places of interest in south-east Derbyshire were visited. Arriving at Uttoxeter, the party drove through the town and across the valley to Dove Bridge—an ancient structure of six quaint arches—which was examined with much interest. On the Derbyshire side of the river the original pointed ribbed arch remains, but the rest appear to have given place to plainer pointed arches of the fifteenth century and semicircular ones of the seventeenth, the whole making with its huge projecting piers, grey with age and lichens, reflected on the broad surface of the Dove, a scene of much beauty, apart from its antiquarian interest. At this point the party left the carriages and struck across Doveridge Park by a footpath near the river. On the left, crowning a steep bank, Doveridge Hall, an imposing mansion of early eighteenth-century character, which is owned by Lord Waterpark and occupied by Lord Hindlip, commands a fine view across the Dove valley, towards the town of Uttoxeter and Bagots Park. In a few minutes an old flour-mill was reached, whose quaint gables and fine group of mossy undershot wheels formed a capital subject for the cameras which were soon levelled at it. A mill is recorded to have stood here in the time of the Domesday Survey, but no part of the present building is older than the seventeenth century, and much of it still later. On ascending a short but steep hill, the party were received at the church by the Rev. Canon Hamilton, who pointed out the more interesting features of the building. Doveridge Church has a fine double arcade and north and south aisles of later style, and among its monuments are a fine incised slab, with a priest in the eucharistic vestments, and a very large and well-preserved mural group to a member of the Davenport family, erected early in the seventeenth century, and having two large kneeling effigies, several small ones, and a child reclining in its cradle. A beautiful silver chalice dated 1619, a fine iron-bound chest, several late brasses, the earliest copy of the register, dated 1575, and a mutilated thirteenth-century cross in the churchyard were also seen. Shading the latter with its immense branches was an aged yew of extraordinary girth, the limbs of which cover so extensive an area that they have had to be supported by quite a labyrinth of props. After luncheon the party drove to Somersall Herbert, where the timber manor-house of the ancient family of Fitzherbert was visited. Here, by the courtesy of Major Fitzherbert, who conducted the visitors in person and explained the less obvious points of interest, a close and appreciative inspection of the interior and exterior of this delightful house was enjoyed. Somersall Hall has all the venerable outward aspect which so many ancient buildings lack. The tall gables, of different sizes and elevations, the timber-work with its quatrefoil enrichments, the variously-tinted plaster, are all untouched by the restorer, and guiltless alike of tar and whitewash. The rector of Somersall (the Rev. Reginald Fitzherbert) explained the features of the church, which is in close proximity to the hall. They include a fine and unusually perfect churchyard-cross, very richly-carved Norman font, and a fine but mutilated freestone effigy of a priest holding a chalice, probably early fourteenth century. From Somersall Herbert the drive was continued to Sudbury Church, which stands near to Sudbury Hall. Though reduced in interest by a thorough restoration, there are many remains in the ancient church, including a Norman door and window, two fine thirteenth-century stone effigies to the Montgomerys, and two picturesque monuments to the Vernons, of seventeenth-century work. Passing through a fine doorway in the garden wall, bearing some initials and the date 1626, a delightful scene was visible from the terrace on the garden front of the hall, an imposing Jacobean palace, which commands a magnificent prospect across a large lake to the distant forest of Needwood. By the kindness of Lord Vernon, the interior of the hall was also visited. Passing round to the front entrance, which faces a very extensive park, the drawing-

room, saloon and other principal rooms, to the grand staircase, were passed through in succession, and the gorgeous ceiling decorations and many fine pictures were examined. Among them are gems by Rembrandt, Vandyke, Rubens and Murillo, and many old family portraits—Romneys, Gainsboroughs, Lelys, &c. Some fine tapestry in the state bedrooms, carving by Grinling Gibbons, and in the long gallery, besides many old portraits, a number of literary treasures were pointed out by the Dowager Lady Vernon, among others the richly-illuminated copy of the "Romaunt of the Rose," which was presented by Francis I. of France to Henry VIII., a complete series of the priceless original folios of Shakespeare's works, early copies of the Koran, and the celebrated Rhyming Chronicle of the Vernon family, written in 1615 by John Harestagg, their faithful steward.

LILLINGSTONE DAYRELL CHURCH.*

I WELCOME you to my church, which is a very interesting one on account of its antiquity. You will, I am sure, not regret the visit you have now paid to it. On your last visit to this northern part of the county, which took place on August 11, 1884, you had intended to visit this church, but were unable to do so from want of time and the greater attractions of Stowe House.

I will now relate to you the information I have been able to gather about this church, and I confine myself entirely to details about the building, though there are other interesting matters relating to the history of the parish which can be traced back before the Norman Conquest. The church is dedicated to St. Nicholas, bishop of Myra, patron of pawnbrokers and schoolboys, whose day in the calendar is December 6. It is not known at what precise date the church was built, or whether there was one here in Saxon times. Some have contended that there was one at that early period, but this seems uncertain. However, as there appears to have been a rector appointed here about the year 1198, it is reasonable to suppose that a church had been built here by that time, if one had not existed before. This church bears marks of an early date, probably of the eleventh century. It probably retains the same shape and proportions in which it was originally built, but it would be impossible to specify all the alterations it has undergone after the lapse of so many centuries. It is recorded by Browne Willis in 1735 (and it is interesting to recall as far as one is able the appearance of a church in the days of our forefathers) to consist of a body, south aisle and chancel, which are tiled; at the west end is a tower coped and covered with lead, flat at top, in which hang three modern bells. Here was, as appears by the walling up of the arches between the pillars, a north aisle agreeable to the south aisle, which was taken down to repair the church, at which time the lead was taken off the south aisle, the upper windows stopped up, and the roof raised over them and tiled, to the great deformity of the church, which was regular before. But we may gather the appearance of an ancient church from further records. Imagine, for instance, the appearance of this church. It would be something like this, and there is very little imagination in the description. The appearance of the interior of a church before the Reformation may be tolerably guessed at by the description of its several parts handed down to us. A rood-loft, or narrow gallery, stretched across the body of the church at the entrance of the chancel, on which a rood or crucifix was placed, accompanied by a statue of the Virgin Mary and the beloved disciple St. John. The chancel was divided from the body of the church by gates. The altar, which was a stone slab marked with five crosses, one at each corner and one in the centre (and the ancient one of this church may be seen let into the floor beneath the communion table, revealing the position where it stood, and is inscribed to a former rector). This slab stood on four short pillars at the east end of the church; on it was placed a crucifix and similar figures as on the rood-loft lighted up with tapers. At a low desk in the middle aisle the litany-desk stood, where the prayers for the dead were said. The pulpit and font probably occupied their present places, and the remainder of the floor was covered with long open seats indiscriminately used by the parishioners. At this time the chancel, and probably the whole church, was paved with what are called Roman bricks or tiles. Some of these were found underneath the pavement when the church was last restored, and they may be seen inserted into the modern tile-flooring of the chancel. It is well that some of these are thus preserved, for had they been cast aside as worthless a most valuable relic of the ancient church flooring would be lost. Though these are called Roman bricks, they are in reality the ancient ecclesiastical tiling made specially for church purposes, as the designs will show. These designs embody Christian emblems and mottoes; if the church was connected with a monastic institution some engraving would show the abbot's head, and if the flooring was provided at the expense of a private individual the arms of the donor would be engraved on some of them. The dates of these tiles are of the thirteenth or fourteenth century. Those that are uncoloured and embossed are supposed to be of the early part of the twelfth century, or about the time of Stephen's reign. Some of these may be seen inserted in the pavement within the communion rails, and similar ones are to be found in St. Albans Abbey. These embossed tiles are very rare and the most ancient in existence. Those that are engraved and coloured are much more common, and examples of these are seen in the pavement of this chancel; other examples are to be met with in Tewkesbury Abbey and Gloucester Cathedral. And the modern Minton tiling is a copy and reproduction of this old tiling. In many instances several tiles or bricks formed but one pattern, the circles, &c., crossing from one brick to another. They are undoubtedly the remains of the original flooring of the church when first built. We know that many Roman stations were at no great distance from here—Stony Stratford and Towcester, for example. Several of the neighbouring churches seem to have been similarly paved. Examples of these tiles, in excellent preservation, may be seen in the churches of Maidsmoreton, Wappenham and at Lillingstone Lovell, which is now undergoing repair; the composition of these tiles may be examined, and the art of making them was no doubt at first taught by the Romans, and it is thought that at one time a pottery existed where Mr. Robarts's kitchen garden at Tile House now stands.

The changes which took place in churches after the Reformation were chiefly the substitution of a wooden communion table in place of the stone altar, which was placed in the body of the church; then the altar was again restored with all its appendages, and then was once more displaced by the present table, which was ordered to stand always at the east end in the place where the altar formerly stood. At this latter eventful period the King's arms also triumphed over the Cross, and the Ten Commandments occupied the station they now do in some churches at the east end. Could we see the churchwardens' bills of those days we could ascertain the number of copes, vestments and sacred utensils necessary for the celebration of the ancient worship, all of which were provided for by the parish. Since that period the laziness or pride of individuals gave rise to the reprehensible plan of converting the open seats into family pews, by which many monuments on the pavement of churches are covered; however, whenever a church is restored nowadays the open seating is reverted to, but too often the seats are allotted to the more opulent inhabitants, instead of being left to the indiscriminate use of the parishioners. These are the principal alterations which took place in the churches generally, but of the particular alterations which have taken place in this church, both in the building itself and its furniture, there is no record, though it must have undergone many in the preceding centuries. In 1804 and after several are noted as having taken place in a few years; for in 1804 the body of the church was repaired and ceiled, and the belfry enclosed, no doubt at the expense of the parish, whereas the communion rails were put up at the expense of the then rector, John Langham Dayrell. Five years after, in 1809, the chancel was ceiled by Richard Dayrell, the then patron. In 1811 a silver waiter, as an alms-dish, and a small silver gilt cup were given at Easter to this church by the same Richard Dayrell. In 1813 a gallery was erected at the west end at the joint expense of Richard Dayrell and the parish. We can tell from these details what the church was like before the last restoration. We have a similar instance in the sacred fane in the next parish, Lillingstone Lovell, before the restoration was began. Looking towards the east end, we see the window half blocked up with a plain unornamented board, on which are printed in plain black letters on a white ground the Ten Commandments, the Creed and the Lord's Prayer; beneath is an ancient oak communion table, round which is inscribed this inscription, "Samuel Walstall, in Artibus Magister, Ecclesiae dedit, Anno Domini 1633," translated, "Samuel Walstall, M.A., gave it to the church in A.D. 1633." On the north side of the table is a raised tomb, with a black marble slab on top, with cedar sides (the slab has since been lowered to the ground and the cedar wood taken away). On the opposite, the south side, there was nothing of importance to notice, the niche in which is the piscina and credence table being blocked up; the floor tiling were squares with plain embossed devices, much broken and dilapidated, enclosed with massive oak rails; the walls and ceilings whitewashed, and in many places green with damp. In the chancel are two pews opposite each other, the squire's and the rector's; the centre of the open space is taken up with a raised tomb with the figures of a man and woman on the top; at its foot is a small brass of a headless ecclesiastic inscribed to Richard Blakesley, and let into the stone pavement. On the north side of the chancel, close to the communion rails, is a plain stone slab, coffin-shaped, slightly raised under an arch, supposed to be the tomb of the founder, whoever he might have been. This is called an Easter sepulchre, and a similar one is to be

* A paper by the Rev. R. Dayrell, read during the visit of the Bucks Archæological Society.

seen in a church at Northwold, in Cambridgeshire. On the south side is a continuous sedilia under arches, broken at one end by a raised altar tomb, with a dark marble slab on the top, having a brass upon it of a man and a woman, inscribed to Paul Dayrell and Margaret his wife, and the chancel is divided from the body of the church by a low arch of very early Norman architecture, if not Saxon. The rest of the church consists of a body and south aisle, divided by pillars : whereas the pillars on the north side are walled up. It has a low ceiling, whitewashed, as also the walls, upon which no doubt are painted in plain black letters on a stone ground enclosed in lozenge-shaped rings, texts of Scripture, whilst on the north side are hung up some old hatchments ; and the body is adorned with oak pulpit and sounding-board above, reading-desk and clerk's desk, known familiarly by the name of a "three-decker": the parishioners' pews are of oak, square or oblong-shaped, and the floor is paved with large square Purbeck paving stones, very irregular and broken ; whilst at the west end is a gallery in which is a barrel-organ and a hatchment of the Royal arms, hanging on the wall facing down the church. The tower arch would be closed in and a door leading into the belfry, in which hang three bells.

Now, before this time it is stated, "The church is a plain building of stone, and appears to be very ancient, from the aisles being paved with Roman or Saxon bricks ; part of the church has also been paved with the same materials, some of which are entire ; but the ravages of time are, alas ! so conspicuous as to require a new pavement. The church porch is no doubt of great antiquity, supposed to be Anglo-Norman, if not Saxon." There was only one pane of painted glass, representing the Virgin Mary, in a window to the left of the pulpit, under which formerly there used to be a side altar. This, no doubt, was brought from Luffield Abbey when it was demolished, for the chapel was dedicated to the Virgin Mary. This pane of glass was taken by the workmen at the restoration.

The church was last restored in 1868, when a north aisle with vestry and organ-chamber were added. A new tiled roof to the whole church was made. The walls were cleaned and fresh plastered ; a glazed tiled floor laid down within the communion rails ; a tiled flooring in the chancel, and the rest of the church paved with the old stone paving ; a new communion rail on iron standards ; a new communion table of foreign oak, also a pulpit, reading-desk and lectern of oak, a font of stone, and pitch-pine benches were placed throughout the church. The restoration was undertaken by Mr. A. J. Robarts. The pews were formerly made of oak, and this wood was, after the restoration, used to panel round the Royal Latin School at Buckingham. The old communion table, which for about twelve years stood in the vestry, was presented to Foscott Church, near Buckingham, at its restoration in 1887.

Of other records of the church there is only need to mention the registers. In an old terrier, undated, but evidently of the year 1820, it is stated :—"We have three parish registers. No. 1 commences A.D. 1584 ; many parts of which are mutilated and imperfect. It, however, records the circumstance of the font being broken by soldiers, October 7, A.D. 1644," perhaps in the civil wars of Charles I. It was, however, repaired during the week, and a baptism took place the following Sunday, the broken font being used on the occasion. In 1826 the font is stated to be of wood, and probably was the one in existence until replaced by a stone one in 1868. From an old Exchequer document we gather that Paul Dayrell, the elder, received from the Commissioners of King Edward VI., on May 5, in the seventh year of his reign, A.D. 1553, "a chalice of silver with the paten, a surplice and linen clothes, to be kept safely for the use of the communion, and two great bells."

In a terrier dated 1785 is given this record of church furniture. "There belong to the church three bells, a font of stone, a coffer with three locks, a decent surplice, a book of Homilies, a Common Prayer-book, and a Bible of the last translation ; a pulpit cloth and cushion of crimson velvet, a linen cloth and napkin" (see below), "a silver cup and paten weighing about 14 oz. There are likewise a bier and hearse-cloth." In an earlier terrier dated 1745, the same articles of furniture are mentioned, but these words are added, "A linen cloth and a napkin for the communion table." In a terrier dated 1812, there are mentioned these additions to the communion plate, besides those before named :—"One smaller silver-gilt cup and silver waiter." There is an inscription on the silver waiter, notifying that it was the gift of Mr. Richard Dayrell, A.D. 1811 ; and as the silver-gilt cup is now mentioned for the first time, it is only reasonable to suppose that it was also the gift of Richard Dayrell.

A full description of the communion plate has been lately supplied to Mr. Myres, of Swanbourne ; so no more need be said on this point. Other points of interest are the bells. Two great bells are spoken of in the Exchequer account. Whether these are the first bells received in this church, or whether there were any earlier ones, it would be impossible to say ; and when these bells were recast or renewed there is no record ; certain it is that none of the bells at present in existence are of such ancient date, nor can it be stated when the third bell was added. We know that in 1735 there were in the tower "three modern bells." The date of the three bells now in the tower are respectively 1674, 1726 and 1868. This last bell was evidently recast at the time of the last restoration of the church. The inscriptions on the bells are of little importance ; they record who made them, and the date ; they are, however, thus stated :—

Large bell. "Richard C. Handter, MADE ME, 1674." D.N.
Centre bell. "Edward Hall made me, 1726."
Little bell. "CAST BY JOHN WARNER AND SONS, LONDON, 1868."

Of books, the only remarkable one is a book of Homilies, in black letter in Old English characters. A pulpit cloth, embroidered with the Dayrell arms in coloured silks and gold and silver thread (faded), with the motto "Doe well," and a scroll, in which are these words, "Donum Majister Thom. Dayrelli Armiger, 1659," and having a thick fringe at bottom of silver lace, tarnished by time, and it is said that, judging from the date of this ornament, it shows the wave of feeling that was then passing over the country, preparatory to the restoration of the Monarchy in 1660, for a few years previous to this date, such an ornament placed in a church would have cost any man his head, it being denoted as a symbol of Popery in the days of narrow bigotry in the time of the Commonwealth. This pulpit-cloth was hung in the chancel in 1873, below two helmets on the north wall, it not fitting the new pulpit which was placed in the church at the last restoration. The crimson velvet cushion which was placed on the pulpit, and was undoubtedly of the same date, was eventually destroyed, as it was a receptacle for moths, to the great destruction of the other furniture of the church. Before the Reformation these cushions were used as kneelers at the altar for the priest, as may be seen in some Roman Catholic chapels at the present day.

The only parts of the church which have not been spoken of are the hagioscope, or, as it is vulgarly called, "the squint-hole," in the wall on the north side of the church under the low arch leading into the chancel, close to the reading-desk, the use of which was for penitents to view the Mass or Sacrament of the Lord's Supper, and the "ambarium" (?), or small cupboard, in the side of the wall of the south aisle, alongside of where formerly a side altar stood dedicated to the Virgin Mary, used for keeping the reserved consecrated wafer for the communion of the sick.

The piscina (Lat., a fish, so translated from a Greek word for the same creature, the letters of which word were supposed to contain the different names and titles of our Lord) is, with the credence above it, built into a niche in the south wall of the chancel within the communion rails, was intended to rinse out the vessels after use at the sacrament, and the credence was a slab to place them upon until they were wanted for use.

The most noticeable architectural features of the church are undoubtedly the porch, most beautifully modelled and proportioned, having a stone slab roof to it, of which there are few examples in England. On a stone at the east angle of the south aisle, on the outside of the building, about 4 feet from the ground, are carved two sun-dials, called Saxon sun-dials, supposed to be builders' marks. Anciently our churches were built by Freemasons, and this mark may have something to do with their craft. On the same side of the church is a beautiful specimen of a Norman window of the early twelfth century. The two arches, east and west, inside the church are Anglo-Norman of different dates. The ecclesiastical ancient floor-tiling has been mentioned, specimens of which now remain. The Easter sepulchre is rare. The running or continuous sedilia is not often met with. The hagioscope is met with in several churches in this neighbourhood, and other features which may be met with in other churches are wanting here.

FRAMFIELD CHURCH, SUSSEX.

THE restoration of Framfield Church, including the erection of a new tower, is about to be undertaken under the direction of Mr. B. Edmund Ferrey, F.S.A. The Vicar has issued an earnest appeal to Churchmen and archæologists throughout the diocese, pointing out that the large and scattered parish of Framfield contains very few landowners (many of these residing elsewhere) who are able to give. Framfield Church was built about 1280 (where one of much earlier date had previously existed, portions of which remain in the present north wall) by Boniface, Archbishop of Canterbury, and dedicated to his murdered predecessor, Thomas à Becket. The tower fell, or was taken down, in 1667. The new tower is being built as nearly as possible on the site of the old one, and in character with the rest of the church. The main building is, however, much dilapidated, many of the seats and most of the flooring being rotten, and the timber of the roof, especially of the aisles, very much decayed. The interesting covering of

Horsham slabs, and the oak waggon-shaped and panelled ceiling of ancient date, will be retained. The work is urgent, and fully 2,000*l.* is estimated as required, besides that already given for the tower. About 1,200*l.* has still to be obtained, for it is proposed, besides executing these needful repairs to the whole of the exterior and interior of the church, to fix suitable hot-water apparatus for heating, to build a wall with lych gate at the entrance round the old and new churchyard, and to add all else that is needed to make the church suitable for its sacred purpose, without expenditure on objects of fittings and furnishing that may be left to the liberality of individual donors at a later date.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT the monthly meeting, the president, Mr. William J. Anderson, in the chair, a paper on "Modern Congregational Churches" was read by Mr. Henry D. Walton, architect. After summarising the objections to the Anglican type as generally practised, having aisles that require columns, either of stone that obstruct or metal that appear hardly to support, he directed attention to a suggestive field in Eastern Mediæval examples. At Torcello and Milan, Thessalonica and Cairo, are models that require but little adaptation to meet admirably the necessities of a large auditory and yet conserve reasonable ecclesiastical and architectural traditions. Diagrams and prints of the old examples instanced, and of some modern London attempts to apply these to present-day requirements, were exhibited. The discussion was opened by Mr. M'Gibbon, and taken part in by several.

A CENTRAL STATION FOR BELFAST.

THE growing importance of the commercial capital of Ireland is daily emphasising the desirability of a central railway station. At present it is impossible to pass through the city by train. Passengers *en route* are obliged to change, and on reaching another station in a remote portion of the city are subjected to the inconvenience of "carrying," and probably, if their arrival has not been punctual, of the continuity of their journey being interrupted. Some time ago, when the property of the White Linen Hall, owned by the Countess of Shaftesbury, passed into the hands of the corporation, the site was spoken of as suitable, but was abandoned in favour of the new city hall. Recently a number of gentlemen, representing a company of London financiers, visited Belfast. They spent some time in considering a scheme which would be equally serviceable, and they have arrived at a conclusion which at first sight, at all events, appears practical enough. It is intended that a central station shall occupy a site in King Street, close to Smithfield. The Northern Company's connection is to be tunnelled by York Street and Royal Avenue, and the line from the present County Down terminus, continuing the low level, will reach the proposed centre by Waring Street and Berry Street. It is also proposed to tunnel the Great Northern from a point outside the existing station in Great Victoria Street. The scheme also provides for the building of a grand hotel on the central station premises. In the course of a few days a deputation of the promoters will visit Belfast with the object of waiting upon the directors of several railway companies and submitting proposals. Should the interview prove satisfactory the Bill will be promoted forthwith, and the capital, which is roughly estimated at three-quarters of a million sterling, provided. Sir Frederick Bramwell is mentioned as the consulting engineer.

DUNDEE AND ELECTRIC LIGHTING.

THE members of the deputation appointed by the Dundee Gas Commission to inquire as to the proposal to introduce the electric light into Dundee have submitted their report. The deputation examined the Deptford, Bradford, Chelsea and St. Pancras vestry systems, and state that, after carefully considering the whole matter, they think the commissioners, if they resolve to supply the light, should adopt the low-pressure continuous current system, with a station as near the centre of their compulsory area as possible. In regard to the financial aspect of the question, the deputation state that, looking to the many joint-stock companies which have undertaken the supply of electricity, which in the majority of cases have not been financially profitable, they cannot hold out, at least for some time, any prospect of the undertaking in Dundee being free from loss. Yet, in view of the great progress which has been made within the last few years, not only in reduced cost of production, but in many improvements for economical distribution, the deputation was hopeful that in a short time an installation in Dundee, if wisely gone about, might become at least self-supporting. The deputation added that it was generally admitted that 6*d.* per unit was equal to about 4*s.* 6*d.* per 1,000 feet of 18-candle gas. On this point, however, it was difficult to obtain reliable information, but that the cost to the consumer would be considerably over that of gas might be reasonably counted on.

Correspondence.

Escape from Fire.

SIR,—Under the Factory and Workshop Act, 1891, section 4, which comes in force on January 1, 1892, all factories in which more than forty persons are employed have to be furnished with a certificate from the sanitary authority of the district in which the factory is situated, that the factory is provided on the storeys above the ground floor with such means of escape in case of fire for the persons employed therein as can reasonably be required under the circumstances of each case. As far as I can ascertain the authorities have not made any regulations. As the subject is of great importance, I venture to call the attention of our profession to it, and suggest that an endeavour be made to obtain uniform regulations for the administration of the Act for the guidance of the authorities and the owners of such properties or their professional advisers. The Act makes the owner, and not the occupier, responsible for the provision of the alterations which may be required before the certificate is granted. In the application of this section to the administrative county of London the London County Council take the place of the sanitary authorities.—Yours faithfully,

HERBERT D. SEARLES-WOOD.

157 Wool Exchange, Coleman Street:
September 7, 1891.

GENERAL.

The Painting of Christopher Columbus, executed by the famous Moro in 1540, and purchased in London, for 2,000*l.*, by Mr. Charles F. Gunther, has arrived at the Custom House in Chicago, and will be displayed at the Fair.

Messrs. W. Sugden & Son, of Leek, are the architects of the new Roman Catholic church, which it is proposed to erect in the Avenue, Kidsgrove.

The State Government of Guernsey has commissioned Mr. Frank Whitmore, architect, of Chelmsford, to inspect some sites and design new school buildings for the island.

A New Theatre, erected at Southport at a cost of about 20,000*l.*, from the designs of Mr. Frank Matcham, has been opened.

Mr. Penrose has paid a visit to Great Chiswell Church, and has given his opinion that the tower can be made safe at a trifling cost.

Plans prepared by Mr. Alexander Cullen, architect, have been sanctioned by the Motherwell Dean of Guild Court for the building of a Free Church in Windmill Hill Street.

Herr Krickl, architect, of Vienna, who was taking a tour in the Austrian Alps, and is known to have ascended the Hoch König, near Bischofshofen, without a guide, had been missing since August 19. His body was found in a safe place, where he succumbed to exhaustion.

The Ruins of Sandown Castle, Deal, are rapidly disappearing owing to the action of the sea, and it is stated that unless prompt measures are taken, in a very short time all that will remain of the historic pile will be the site and the name.

The Public Park presented to Jedburgh by Mr. John Tinline, London, a native of the burgh, has just been opened.

A New Church has been erected at Leeds, the ventilation of which has been carried out by the "Climax" Ventilating Company, of 15 Great George Street, Westminster, S.W.

A Committee of the Town Council, Newcastle-on-Tyne, are taking steps for enlarging the city lunatic asylum and inviting competitive plans from local architects.

The Hornsey Local Board have acquired about eight acres of picturesque and well-wooded land for the extension of their pleasure-gardens at Hornsey. As the property was about to be laid out for building, the Board authorised its chairman (Mr. H. R. Williams) to negotiate with the owners with a view to its purchase, and it has been secured for the sum of 5,000*l.*, and is now being enclosed with iron railings previous to being laid out as a public recreation-ground. The newly-acquired property contains some fine trees, and extends from the existing pleasure-gardens at Hornsey to Crouch End, and is situated in the midst of a district which is being rapidly covered with houses. The acquisition of this property, although of somewhat limited area, will be a lasting benefit to the neighbourhood, and it is to be hoped that Mr. H. R. Williams will be equally successful in the efforts he is making to obtain the beautiful grounds of the Alexandra Palace as a public park for the use and enjoyment of the people.

The Architect.

THE WEEK.

THE hesitation to accept the proposals for the transformation of the Architectural Association is likely to be overcome, in some cases at least, by the appearance of the "particulars and details of its new curriculum." If, as Cardinal NEWMAN has said, the essence of every great school consists in the teachers rather than in patronage or prizes, the list given in the *brochure* ought to be enough to remove all doubts about the success of the enterprise. Mr. ELSEY SMITH should be competent to explain Orders, Professor KERR has had years of practice in teaching all about materials, Mr. H. ADAMS has instructed many students already in land surveying. Some of the other teachers have formerly made a name in Association classes, viz. Mr. FARROW, history of architecture, materials and construction; Mr. COLE ADAMS, elementary ornamental and colour decoration; Mr. E. PRIOLEAU WARREN, colour decoration; Mr. LACY RIDGE, professional practice; Mr. MAX CLARKE, sanitary science; Mr. SCHULTZ and Mr. J. A. SLATER, superintendence of studio; Mr. W. G. B. LEWIS, elementary water-colour class. Messrs. HANCOCK, HOLMES, MOODY and BURROWS, who will teach science, have good credentials; Mr. LEANING is the author of a book on quantity surveying, which is evidence of his competence to give instruction in the subject; and it is hardly necessary to recommend Mr. STIRLING LEE and Mr. POMEROY as masters in sculpture, or Mr. A. W. WEEDON in water-colours. It is said that "the aim of the Association courses is to help members to fit themselves for their work as architects, by providing the means by which they may supplement the training acquired in the offices where they are engaged as pupils or assistants; it is not its chief object to prepare candidates for the examinations of the Royal Institute of British Architects"—a statement which is entirely satisfactory. The fees are most moderate. The inclusive fee is 10*l.* 10*s.* for a year, while for separate courses the fees vary from 2*s.* 6*d.* to 3*l.* 3*s.* a year. The curriculum extends through four years. The scheme appears to be practicable throughout, and students for a small outlay will gain many benefits which were not obtainable under the former arrangements of the Association.

THE competition of the local architects for the Nurses' Home in connection with the Blackburn and East Lancashire Infirmary has been decided in favour of Messrs. SIMPSON & DUCKWORTH, of Blackburn, the assessor being Mr. ALFRED CULSHAW, of Castle Street, Liverpool. Every care had been taken to make the competition as fair as possible, and the names of those sending in designs were unknown to the assessor. In consequence of the letter of one of the competitors calling attention to the clause in the conditions that the architect of the premiated design would not necessarily be entrusted to carry out the work, the committee issued a circular stating that the assessor's decision would be adhered to, and the successful architect employed as originally intended, subject only to the condition that he could give satisfactory references of his ability and experience to carry out the work in a satisfactory manner. The result is gratifying to the successful competitors, inasmuch as one of the firm, Mr. A. W. R. SIMPSON, has had a connection with the institution as consulting architect for the past seventeen years.

THE venerable Sir JOHN STEELL, who died this week in Edinburgh, should not be judged solely by the statue of BURNS which is placed in the Embankment Gardens and is an adaptation of his bronze in Dundee. His seated figure of Sir WALTER SCOTT and the equestrian statue of WELLINGTON in Edinburgh are far finer works. He was vigorous enough, but it must be said that in many of his works there is an absence of the refinement which should characterise sculpture. In execution his most successful work is the memorial of the late PRINCE CONSORT in Edinburgh. It is, however, wrong in principle. The Prince is shown mounted, and if it stood alone few objections could be raised against such an equestrian statue. But it is supplemented by other figures exterior to the pedestal, who are supposed to be representatives of the people who were most grateful for the services rendered by the Prince. They are shown to be depositing memorial wreaths. Their action would not be unreasonable if the memorial consisted of a tomb or if the Prince were represented as dead; but it is otherwise with a figure that appears as living and commanding. It is possible Sir JOHN STEELL may have had in his mind's eye RAUCH'S great work in Berlin. In that case, however, FREDERICK THE GREAT is accompanied by the warriors and other great men who, with him, helped to raise Prussia. In the Leipsic memorial of the Franco-German War the pedestal is flanked by figures of the chief agents in the making of the Empire. In fact, there is no precedent of any importance for such treatment as was adopted by Sir JOHN STEELL.

FRANCE has lost another of her great painters by the death of THÉODULE RIBOT. In life and death there was much in common between DELAUNAY and RIBOT. Both were original, and in consequence were compelled to be patient while commissions were being lavished on inferior artists. Both were overcome through heart disease. RIBOT was such a master of light and shade he was worthy of being mentioned with REMBRANDT and VELASQUEZ. He had not the witchery of the Dutch master, nor the love of colour which inspired the Spaniard; but in making a painted figure appear solid through the contrast of light with darkness, RIBOT was never surpassed. At first sight his manner appears simple, yet we doubt if many have succeeded in making good copies of his pictures. The subjects he selected were adapted to his treatment, and in consequence his works are never disappointing. Some of his scripture scenes are in the Luxembourg, but he preferred to go to ordinary life for inspiration. He was homely in his ways, and his pictures have some of his character. He was born sixty-eight years ago, and was taught in GLAIZE'S *atelier*. He was not represented in the Salon until 1861, and although some competent judges recognised his power the purchasers held aloof. RIBOT never sacrificed to expediency, but bided his time. He made drawings and etchings, and kept his hand in practice with humble work. Mainly through the enthusiasm and influence of M. PAUL LEROI, the French people became aware that so unique an artist was still among them and able to endow them with works which were enough to uphold the credit of the French school. RIBOT'S latter years must have been satisfactory to him, for his skill was appreciated, his hand remained as strong as it was thirty years ago, and he no doubt anticipated some years of glory.

THERE is little chance for a revival of interest in heraldry unless the use of a coat-of-arms becomes a luxury that has to be paid for, and therefore it is well to have the law about licensing armorial bearings carried out. But a line should be drawn at bearings which are properly depicted. It could hardly be contemplated by the Legislature that any one wearing a ring with a crest, which may not belong to his or her family, is to be suddenly pulled up and interrogated upon the possession of the authorising document. This, however, has occurred in Lambeth. An Excise officer called on an auctioneer about his professional license. The gentleman wore a ring which attracted the attention of the exciseman, because there was a lion rampant on it. The auctioneer was asked whether he paid a license for using such armorial bearings, and he replied that he did not, as, having bought the ring with the crest upon it, he had no idea he was doing wrong or that he should have taken out a license through the Excise for wearing it. He was accordingly summoned to the police-court, and the magistrate held that the auctioneer was liable. If he wore armorial bearings or used them he was bound to take out a license. A fine of 1*l.* was inflicted and 5*s.* costs. Any one who makes use of a crest which has no association with his family deserves to be well fined by the Heralds' College for his presumption, and the case suggests that a revival of the Visitation of Arms has become a necessity. Still, the most zealous herald would not care to meddle with people to the extent that was exhibited in Lambeth.

BYZANTINE ART.*

THE second part of the laborious undertaking of M. KONDAKOFF will satisfy all the expectations which were raised by the first. The author, from his official position, possesses facilities for investigating all subjects that are associated with Byzantine art, and his pages are evidence that he has turned them to good account. His attention has been absorbed by the miniatures for the present, and they are related in many ways to various forms of art, but it is to be hoped that M. KONDAKOFF will afterwards treat of other manifestations of Byzantine skill, and in that way increase the obligations to him of all students of a most difficult subject.

In the second volume the period extending from the end of the ninth to the beginning of the thirteenth century is considered. Readers of GIBBON cannot forget the dramatic history of BASIL, the Macedonian, whose adventures seem like a tale that originated in Eastern imagination. Once settled on the throne of Constantinople, BASIL displayed the genius of a born ruler of men, and secured a temporary stability for the empire. His financial arrangements were of a novel kind. The historian relates how BASIL "assigned two patrimonial estates to supply the decent plenty of the imperial table; the contributions of the subject were reserved for his defence, and the residue was employed in the embellishment of the capital and provinces." It is no wonder that M. KONDAKOFF should date the most brilliant period of the Byzantine School from the Macedonian dynasty. The influence of the revived school soon spread through Europe and Asia. At the beginning of the tenth century there were no doubt apprehensions of the coming end of the world, but on that account people became more interested in religious art, and the productions of Byzantine miniaturists were sought by all who could pay for them. There were qualities in the style which made it serve at the time as a sort of universal language which pious people could understand. As M. KONDAKOFF says:—

> What caused the universality of Byzantine art was its tendency to abstraction. The perfection of the processes gained for it appreciation among people who were unlike in their origin and in their tastes. The miniatures and images executed in Constantinople served as models not only to the artists of the Empire but to those who dwelt in countries as distant as Georgia and Sicily. There are few parts of the East where Christianity is accepted in which the peculiarities of the art are not still to be traced. On the other hand, if it were not for the firmness of the principles of the art the artists could not have resisted the influence of the novel elements which were introduced from the East. Henceforth the court of Byzantium on one side and the convents of Constantinople on the other were the arbiters of taste, and gave character to art. The vast series of mosaics found in Palermo, Monreal, Cefalu, Naples, Salerno, St. Mark's, Venice, St. Just's, Trieste, in Greece from Daphne to Athens, in the Caucasus from Ghelati to Koutais, in Kief, were executed after cartoons which came from Constantinople or from designs prepared in that city. With some slight differences the technique and execution may be said to be everywhere similar.

According to M. KONDAKOFF, the miniatures or illuminations of the early part of the period which he treats denote that the artists were preoccupied with thoughts of colour, and saw everything they reproduced in rose or blue. The backgrounds recall the banks of the meadowy Bosphorus, the landscape being softened by the most delicate tones. Regard for nature is one of the characteristics of the Byzantine works in the eleventh century. But the smallness of the scale of the miniatures was a disadvantage, as it was an obstacle to vigorous treatment. The ornamentation passed through various stages. M. KONDAKOFF says that in the ninth century the initial letters were adorned with forms that were borrowed or conventionalised from nature, and the colour is suggestive of enamelling. Afterwards there was a nearer approach to reality. In the eleventh and twelfth centuries figures of animals were intermixed with plant forms in a fantastic manner, and thus suggest that Romanesque art was the continuation of the Byzantine. In course of time the figures of men and animals introduced became only a sort of abstractions or symbols, and then the artists were constantly under the temptation to repeat stereotyped forms. The history of Byzantine art from the twelfth century suggests that there was some ground afforded by the weakness of spirit to enable GIBBON to say, in his sneering manner:—"The bolder forms of sculpture, in brass or marble, which peopled the temples of antiquity were offensive to the fancy or conscience of the Christian Greeks, and a smooth surface of colours has ever been esteemed by them as a more decent and harmless mode of decoration." Even the works which gave rise to the tumults of the Iconoclasts do not appear to have been marked by vigorous treatment. There was always a strange tendency towards decline in Byzantium, and to anyone who has endeavoured to realise the character of the people, it is not surprising that the work of the illuminators became only, as M. KONDAKOFF says, mere rhetoric in painting, and a rhetoric, too, that was devoid of sentiment. The "Ménologe" of the Vatican may be taken as a sample of the degeneracy to which the art had fallen. The drawings are described by M. KONDAKOFF as a maladroit idealisation of simple figures: nature is replaced by artificial types; there is nothing dramatic; everywhere the human figure appears according to an uniform canon, and as the Byzantines did not care about differences of nationality, there is no trace of any distinction of race.

It is remarkable, however, that at a time when the miniaturists were fast losing all spirit and becoming mechanical, works in mosaic were produced which still command admiration. M. KONDAKOFF, among other buildings, describes the church of St. Sophia, at Kiev on the Dnieper, of which the decoration dates from 1051, as evidence of the system which was approved in those days. In the cupola is the image of CHRIST, surrounded by great figures of archangels, prophets and apostles. In the apse a colossal figure of the Blessed Virgin praying symbolises the terrestrial church. Below is a *Last Supper*, in which CHRIST is shown passing bread and wine to the apostles on either side; while lower still are figures of the fathers of the Church. Under the cupola are figures of CHRIST, the Blessed Virgin and the Baptist, a group known as the "Δέησις," or representation of the terrestrial church in Paradise. Elsewhere are medallions of the martyrs. To many the most remarkable part of the decoration of St. Sophia in Kiev will be found in the remains of the fresco paintings on the interior walls of the tower containing the staircase by means of which the princes of the city reached their seats in the choir. These frescoes, says M. KONDAKOFF, were treated with great spirit, religious and profane elements were intermixed in them, and the aim of the artists was evidently to speak to the eyes. Various spectacles are depicted, and particularly the games of the hippodrome and circus. In the hippodrome four chariots are about to start, the drivers having costumes of the four Byzantine colours. The attendants, police-officers and others are represented. In the circus, which is covered, are to be seen musicians, acrobats, clowns, mimics, who are all performing. M. KONDAKOFF says there was nothing repugnant to the religious spirit of the eleventh century in the introduction of scenes that were not ecclesiastical. In Palermo, the ceiling of the Palatine chapel is painted with similar subjects. The subjects were also employed in Mediæval illuminations.

M. KONDAKOFF gives ample descriptions of the principal manuscripts containing Byzantine illuminations which are to be found in Europe. The famous Psalter No. 139 in the Bibliothèque Nationale of Paris, which some authorities hold to be a copy of an ancient work, probably of the tenth century, is, according to M. KONDAKOFF, a very characteristic example of the purest Byzantine art of the ninth and tenth centuries. The drawing of *David (as Orpheus) playing the Harp* is properly described as being Pompeian in all its details, and the principal figure surpasses all those of ORPHEUS in the Catacombs. In *David overcoming a Lion and Bear* he says is introduced an antique figure of *Force* that was derived from the statue of *Diana the Huntress*. The *Exaltation of David* is essentially Byzantine, for the king is clothed as one of the emperors. The figures of *Wisdom* and *Prophecy* were evidently imitated from some classic works. The Psalter is one of the treasures of the Paris Library, and M. KONDAKOFF considers that in execution it is superior to the no less famous Psalter of the Vatican.

* *Histoire de l'Art Byzantin, considéré principalement dans les Miniatures.* Par N. Kondakoff, Directeur au Musée Impérial de l'Ermitage. Edition Française Originale. Publiée par l'Auteur, sur la traduction de M. Trawinski. Tome Second. Paris: Librairie de l'Art.

M. KONDAKOFF possesses the knowledge by means of which many things in the miniatures which puzzled earlier investigators become clear and impart a new interest to the work. It may be truly said that never before was Byzantine art so well described and interpreted. There is a spirit of reverence in M. KONDAKOFF's remarks which is well suited to the subjects, that are mostly Biblical. The descriptions open out a new field for archæologists, as they reveal the fidelity with which mosaicists followed illuminators. As in Greek sculpture there were types which had to be kept in view, it may also be said that the Byzantines created models for Romanesque and Mediæval artists. This peculiar conservatism is explained in M. KONDAKOFF's valuable volumes.

OLD BARGEBOARDS.

BY A CORRESPONDENT.

THERE is scarcely any one detail in the work of the Middle Ages which cannot be treated quite as a monograph; that is, in such a manner that the more it is written about the more it is found what a mine of unexplored wealth is still left uninvestigated. One man may appear to have thoroughly exhausted its resources, when lo! another takes up the subject independently, very possibly without having heard of or seen what the other has done, and the results are found to be extremely different, with scarcely any repetition, such as might have been expected. For, instead, there is a great deal of fresh information; new light is thrown upon dark corners, and the student impelled towards lines of thought previously undreamt of. The writer might instance such subjects as the ground-plan of the English parish church, the types of tower in different counties, the Eastern sepulchre, window tracery, low side windows, and so on. Put two or three men who have been real students, not only of books but of buildings, to write upon any one of these points, without having any communication with each other, and note what a variety of information will be collected, particularly if these inquirers have been long engrossed in their darling pursuit of ecclesiology or archæology. With this brief introduction, let us now consider the theme of "Old Bargeboards." What a picture this conjures to the mind of many a charming, ancient house, perhaps much ivy-mantled, with all those truly English accessories of a real house that differentiate it so much from the majority of Continental examples. In Mediæval bargeboards there is, of course, much variety in the general treatment, and it is interesting to analyse and dissect these exquisite specimens of our forefathers' inventive taste. But before proceeding further with the general subject it will be well to touch upon the derivation of the term "bargeboard," or as it is more correctly termed, "vergeboard." The barge-course is that part of the tiling which projects beyond the face of a gable wall; hence the origin of the word. There can be no question whatever as to the superior beauty of that type of building which carries a bargeboard as compared with stone-coped gables. Look at the half-timbered or weather-tiled and roofed houses and cottages of Kent, Sussex, Surrey and Hants, and then those of Cornwall, Wales, Derbyshire, Yorkshire and Lancashire, with their slated roofs, the walls also frequently smoke-begrimed owing to the busy manufacturing districts where they have been planted down. No doubt there is more dignity and grandeur in the latter than in the former; but for that charm peculiar almost to "Old England," the southern type bears the palm. It is a pity that the speculating builder, with his "architectural" draughtsman, have tried their best unconsciously to vulgarise the Mediæval bargeboard, attempting first to copy (and doing that most indifferently) and then proceeding further to improve, as they vainly imagine, on the original. For example, old bargeboards do not usually have that great projection found in many modern ones, unsuitable to our climate as much as the considerably overhanging eaves of the south of Europe would be here. The writer is not so much alluding to the present style of bargeboard, with which he is not altogether in accord, but to that of an earlier period of the nineteenth century. Sometimes these are lath-and-plastered on the soffits behind the bargeboard, which makes them look still heavier and more ugly. There is another objectionable feature, as a rule, in the type of modern bargeboard just touched upon, *i.e.* the exaggerated "gable-knob" (or hip-knob, as more generally but very incorrectly called in connection with a bargeboard). This is occasionally found in ancient examples, but its use is exceptional and its treatment requires great skill so as to avoid a vulgarised effect. At the Grey Friars' Hospital, Coventry, is an elaborate octagonal and panelled gable-knob carried well up above the ridge of the roof so as to form a feature. It is of the early sixteenth-century period, and at Ludlow is another example of late sixteenth or early seventeenth-century date. The majority of bargeboards carried out, say, within the last ten years are simply mitred at the apex, and in most cases moulded, not perforated, panelled or carved. Often, in the writer's opinion, they are of insufficient projection both for utility and effect. The original *raison d'être* of our bargeboard was to protect the upper part of the gable from wet. No architectural student would pretend to say that it would effectually carry out that purpose; but there can be no manner of doubt that a bargeboard which is designed on the *via media* principle of projection must be useful. In some recent instances the bargeboard has been superseded by a moulded rafter, the back edge of which touches the wall. This does away with the primary function that the subject of this article has to perform, for there is no shadow—a great loss where it is reasonably expected, as in the case of a bargeboard. Instead, the probability is that wet, rather than being thrown off, is attracted. Why do some architects vainly endeavour to improve on their forefathers' common sense? The gable-knob, properly so-called, with only a pendant below the bargeboard, is a better finish than a plain mitre, and may be considered as a suggestion of the ridge-piece a little way behind it. In traceried bargeboards the knob is not so much missed, as the design of the perforations or panelled work may be so arranged that the mitre at the top gets overlooked. In a plain moulded bargeboard it is necessarily much more conspicuous.

The "Dictionary of Architecture" comments upon pendants to the eaves of bargeboards as a "modern absurdity." The present writer can see no beauty or suggestiveness in them, but is fain to confess that there is, however, ancient precedent for this feature, as at Chiddingstone, Kent, in some old houses there and also elsewhere. It by no means follows that "we should follow the multitude to do evil," *i.e.* that because something boasts of antiquity, therefore it is good. Where all the architectural surroundings are very rich this little excrescence, or piece of prettiness, may not come in amiss. But to put it in an ordinary speculating builder's "villa residence" is a different matter, where it only becomes pretentious.

Primarily bargeboards may be divided broadly into two classes—those which are straight on the underside, and those which are curved or shaped. There are of course subdivisions, which will be noticed further on. The writer is of opinion that the first-named is the superior, and in this year of grace, 1891, the majority of bargeboards in those buildings where an architect properly so-called has been engaged, this appears the favourite type. There is something substantial in the long straight line on the lower edge. In principle it is really the same as the enclosed arched line to the cusping of a decorative wall arcade or in the tracery of a window. In the latter the insertion of "eyes" helps to enrich and to give a completeness to the outline of the extrados which it otherwise would not have, as an imaginary line can be then drawn. Moreover, the main constructional arch and the decorative cusp are thus in separate "orders" instead of only the cusps having the mouldings. These small points of detail are not trifles; they all deserve minute study. It is one of the great charms and delights of Mediæval work that there is so much variety in its every feature. But to revert to bargeboards. There is an intermediate kind in the two broad divisions first named, where the greater part of the face consists of panelled tracery, only a small portion next the underside being perforated. Respecting that class of bargeboard which is terminated by a straight line on the underside there is the traceried work panelled throughout; the same, but intermixed with carving, or another variety having the flowing carved foliage on the upper-side of the bargeboard and under it arranged in frieze-like fashion, a series of quatrefoils or other geometric figures, as at an example to be seen at the interesting

Ford's Hospital, Coventry. Coming to the later specimens, they lack the vigour of the earlier, some being too flatly treated in a kind of linen-pattern style; not that it is really so, but only mildly suggestive of it. The notion such bargeboards give is that the mouldings were designed on the flush principle, like reedings or the flutings to a Classic pilaster. This, of course, has a poor, tame effect. A moulded bargeboard, however simple in character, looks well if its mouldings are in two or three "orders," so to speak, giving nice crisp shadows when the sun shines, and provided with a tile-verge well projecting, only the bed of the tiles being pointed in, or, as the writer has sometimes done, with a wood-fillet notched on the upper side to receive the tiles. Either of these treatments is better than the too common practice of covering the entire edge of the tile-verge with a coating of Portland cement. Another kind of bargeboard of the later periods is that entirely carved with foliage, flowers, animals and grotesques, which has a rich appearance. The bargeboards of the Elizabethan and Jacobean times, with their frets, guilloches and combination of geometrical forms with grotesques, &c., as at houses at Mayfield, Sussex, are not quite so usual as the varieties previously mentioned. Such ornamentation does not seem to lend itself kindly to the bargeboard. The only other species that remains to be commented upon is that which, at the present day, has gained much favour because it is effective, and also moderate in cost. This is the judiciously-moulded bargeboard with some delicate pateras, or some running half-hidden carved foliage. Or, sometimes, it has the mouldings with a very slightly serrated outline to the under edge. The amplification of the bargeboard occasionally essayed by speculating builders' draughtsmen, or ambitious architectural novices, consists of what looks like a suggestion of a truss, with collar beam, arched braces, &c., projecting considerably from the gable wall, the purlins being brought out and made prominent features with brackets under, back to the wall. All this is fussy in effect and constructionally useless. What object can there be in covering up a considerable part of a gable wall with something out of character? The half-timbered construction flush with the wall is designed on quite different principles, and rests on substantial solid supports.

The gable-knob in some of the later examples of bargeboards is made a prominent and rich feature, being sometimes semi-octagonal in plan and of sufficient diameter to be richly panelled with tracery on each of its sides. The knob pendants look very well if only turned, but if square, octagonal, or hexagonal, are still more effective. If designed on a cruciform plan, having miniature "trusses" projecting towards each of the cardinal points, or in some kind of fleur-de-lys open in the centre, the appearance is good.

Except in timber porches the bargeboard is rarely found in connection with ecclesiastical work, though there seems no reason why it should not be so in the case of simple village churches, where the freestone for gable copings would have to be carried a long distance at some expense.

In conclusion, it is an advantage on the part of the bargeboard over its relative, the gable coping, that its design is susceptible of certainly more variety without much extra cost. For simple buildings the flat stone coping, with apex-stone and possibly ornamental springing-stone, with summer-stone under and the saddle-back moulded coping, are the only varieties, though at Congresbury Church, Somerset, the writer calls to mind an exquisite little lurking patera in the hollow of one of the late Decorated gables. In later work there is the shaped Elizabethan coping, and in brickwork the crow-stepped gable. In modern buildings the late Sir Gilbert Scott has shown how very rich and varied gables may be at the St. Pancras Hotel—overdone there one may reasonably say. In the "Modern Renaissance Freely Treated," the only name the writer can apply to the now fashionable style, the gables have a great deal of work thrown into them. However, the bargeboard can be used where it is most suitable, and the stone or brick coping in those situations where desirable. The writer has only wished to jot down a few notes on an interesting subject, and not to lay down any law.

Karl Eckermann, the German landscapist, has died at Göttingen, in his fifty-sixth year. He was the son of the author of "Conversations with Goethe."

THE BIRMINGHAM ART GALLERY.

A COLLECTION of pictures now in course of arrangement at the Corporation Art Gallery, which will be opened to the public during the last days of the present month, is, according to the *Birmingham Post*, of a very remarkable character, as it will include many of the most celebrated works of members of the pre-Raphaelite school. Many of the examples have never been seen before in Birmingham, and some of them have been lent to the Art Gallery Committee under quite exceptional circumstances. Among them are the *Strayed Sheep*, by Mr. Holman Hunt, which Mr. Ruskin holds to be one of the greatest works in existence. To this will be added the same artist's *Scapegoat*, *Isabella and the Basil Pot*, and *The Shadow of the Cross*. Of works by Sir J. E. Millais the keeper of the gallery has secured no fewer than seven, including the celebrated *Vale of Rest*, which Mr. Henry Tate has generously presented to the nation with a large number of other works, and the famous pictures *Mariana in the Moated Grange*, *The Proscribed Royalist*, the very early pre-Raphaelite work, *The Blind Girl*, a study for the *Huguenots*, *The Baptism of Guthrum*, and *Greenwich Pensioners at the Tomb of Nelson*.

The committee having recently acquired, for the permanent collections, pictures by several great artists, it was thought that further examples of the style and methods of work of these painters would be of great interest to all visitors to the gallery, so that the exhibition will consist almost entirely of the works of the two artists mentioned above, together with examples of D. G. Rossetti, Mr. Burne-Jones, Mr. G. F. Watts, Mr. Ford Madox Brown, the late J. F. Lewis, the late William Hunt, Mr. Henry Wallis and Mr. Arthur Hughes. In this way an opportunity will be given to all art lovers of examining an unusually large series of examples of the earliest and best work of the leaders of the pre-Raphaelite movement; and such an opportunity must necessarily be a rare one, as most of these pictures are in private collections.

Among the works by Rossetti may be mentioned *Beata Beatrix*, *The Damozel of the Holy Grail*, *Sir Tristram and La Belle Iseult*, and *Sir Galahad*. Among the works by Mr. Burne-Jones are *The Adoration of the Magi*, *The Flamma Vestalis*, *The Wheel of Fortune*, and others. The late J. F. Lewis is represented by *The Doubtful Coin* and *Cairo*, the latter specially lent by Lord Northbrook. Mr. G. F. Watts is represented by *Death Crowning Innocence* and *A Roman Lady*; Mr. Henry Wallis by his famous *Chatterton*; and Mr. Arthur Hughes by *April Love*, *St. Agnes's Eve*, and *The Music Lesson*. About twenty works by Mr. Ford Madox Brown have been obtained, chiefly from the collection of Mr. Henry Boddington, of Manchester. Among them are *Cordelia's Portion* (Mr. Albert Wood), *Romeo and Juliet* (Mr. James Leathart), *Sardanapalus*, *Romans Leaving England*, *Haidee and Don Juan*, *Stages of Cruelty*, *The Entombment*, *Cromwell and Milton*, *Weights and Measures*, *The Christening of Edwin*, and others belonging to Mr. Boddington; and *The Last of England*, the property of the Corporation. Among the principal picture owners who have kindly placed their possessions at the service of the committee, not including those mentioned above, are Lord Armstrong, Sir Horace Davey, M.P., Sir John Pender, and Messrs. George Rae, W. Cuthbert Quilter, M.P., G. F. Watts, R.A., W. Coulthart, G. Lillie Craik, William Agnew, James Hall, Humphrey Roberts, H. F. Makins, J. G. Henshaw, Fred Crisp, R. H. Benson, George James, Arthur Severn, Charles G. Clement and Messrs. Thomas Agnew & Sons.

A VENETIAN HAILSTORM.

THE following is an account, which appeared in the *Gazette of Venice*, of a recent hailstorm:—It caused fearful havoc to property. About three o'clock in the afternoon the sky became obscured, and the darkness was so intense as to indicate that a storm of some violence was approaching. The wind raged and the rain fell, followed by hailstones as large as nuts, and sometimes as large as eggs. On the roofs of the houses the contact of the hail gave one the idea of an invisible army of blacksmiths at work on their anvils. Window-panes were broken and tiles blown about and shivered in thousands of pieces. The rattling of the hail on the Piazza of St. Mark was like the rumbling of an iron-plate rolling-mill. The small steamers which ply on the Grand Canal ceased to run, and the glass coverings of their engine-rooms were smashed, although protected with gratings of brass rods. The trees on the Riva of the Schiavoni were uprooted, and the windows of the municipal offices sustained great damage, as well as the windows of many other palaces. The most serious effects of the storm were to be seen at the residence of the English painter, Sig. Henry Woods, who resides in Colle del Dose, San Maurizio. This gentleman has erected from the side of the house into his garden a fine studio, covered in with large panes of plate-glass, and this was thickly covered with vines. Out of seventy-five panes of glass only two remained,

many of the panes representing the curious appearance of spiders' webs, the hailstones having "cut clean through" them. Fortunately, Mr. Woods, who anticipated a severe storm, and having had some little previous experience, removed several valuable paintings from his studio, and so they escaped any damage, but his studio was left a wreck, glass and vines had disappeared. There remained nothing but the wooden framework. The storm will certainly prove a harvest for the glaziers. In the windows of the municipal offices about two hundred and fifty panes of glass were broken, and such was the force of the hailstones that they chipped off pieces of the columns in the piazza and off the steps along the Lido. At the Rima Baths the confusion was indescribable; one of the attendants swooned through fright. The glass-covered entrance of one of the theatres was smashed to pieces. The storm seems to have travelled across Lombardy, commencing at Turin, then Milan and onwards, terminating, but with redoubled energy and with worst effects, at Venice. In the island of the Giudecca the vines were totally destroyed. Telephonic communications were completely interrupted, about one hundred and fifty wires were cut as if by strong nippers, and the damage done amounts to some thousands of pounds.

ART IN THE CHICAGO EXHIBITION.

THE following are the rules and regulations relating to sending works to the Department of Fine Arts of the Chicago Exposition of 1893:—

The Department of Fine Arts of the World's Columbian Exposition will open in Chicago, May 1, 1893, and will close October 30, 1893.

It will be open to such works of American (United States) and foreign artists, whether previously exhibited or not, as may be classed under the head of Fine Arts, under the following schedule:—

Sculpture.—Figures and groups in marble; casts from original works by modern artists; models and monumental decorations; bas-reliefs in marble or bronze; figures and groups in bronze; bronzes from *cire-perdue*.

Paintings in oil; paintings in water-colour; paintings on ivory, on enamel, on metal, on porcelain or other wares; fresco painting on walls; engravings and etchings; prints; chalk, charcoal, pastel and other drawings; antique and modern carvings; engravings in medallions or in gems; cameos; intaglios; exhibits of private collections.

The following will not be admitted:—1. Copies, even though they be reproduced in a class different from that of the original. For example, engravings obtained by industrial processes. 2. Pictures, drawings or engravings not framed. 3. Works of sculpture in unbaked clay.

The Department of Fine Arts shall consist of:—1. An American (United States) section. 2. A section for each foreign country which is represented by a general commission or by a national committee. 3. A section comprising exhibits of private collections and the works of artists of non-represented foreign countries, whose works may be admitted under the provisions of another section.

American (United States) artists must deposit—or cause to be deposited—with the chief of the Department of Fine Arts, before November 1, 1892, a list, signed by them, of such works as they desire to exhibit. A separate list should be made for each group and class, strictly following the schedule. Artists will be duly notified when their works must be sent in for examination by a jury to be appointed in future.

Works of American (United States) artists, produced since 1876, which have passed the examination of juries of exhibitions of acknowledged standing, will be admitted on list, should the jury so determine. An examination of lists will be made at an early day after November 1, 1892. Artists whose works may be admitted under these conditions will be at once informed by the chief of the Department of Fine Arts. Works accepted must be delivered at the receiving gate of the building for the Fine Arts on or before March 1, 1893.

The Department of Fine Arts or its representatives will be responsible for simple interior decoration of the galleries of the art building. Special decoration or arrangements in lighting, &c., differing from those provided, will be executed at the expense of the national committee of the country asking for it, and under the joint direction of the foreign representative and the architect of the art building.

The chief of the Department of Fine Arts will not correspond with the artists of countries represented by general commissions or national committees. The works of these artists will be admitted only through general commissions or national committees having in charge their reception and return.

Foreign artists—natives of countries not represented by a general commission or national committee—should address their request to the chief of the Department of Fine Arts before July 15, 1892. They should notify him of the number of works they wish to exhibit, the subjects and dimensions, including frames. They will then be informed where to send their works for examination by a special jury, who will pass upon the admittance of all such works. In the case of works that have already passed the juries of exhibitions of acknowledged standing and have been exhibited, action will be taken by the jury at an early day after July 15, 1892. A notice of the action of the jury will be sent to the artist at once. Works accepted must be delivered at the receiving gate of the building for the Fine Arts on or before March 1, 1893.

General.—Packing and transportation of all works will be at the expense of the exhibitors, unless special arrangements are made through private enterprise or public effort. A special rule for the guidance of those sending works, giving information in regard to packing, marking and shipping, will be furnished on application.

When a sufficient number of works (pictures) are contributed by one artist to warrant such arrangement, an effort will be made to hang them in one group.

A card of admission will be issued to each exhibiting artist, entitling the holder to the use of the grounds when open to the public. This card must be signed by the holder, and must be shown to the attendant when asked for.

The custodian of the art building will have the care and protection of works of art. Guardians of the gallery will be subject to his direction. He will use all due vigilance to insure the safety and protection of works of art against theft or damage. Information as to special insurance, &c., will be given on application.

Works of art will not be sketched, photographed or reproduced, except with the written permission of the exhibitor, countersigned by the chief of the Department of Fine Arts.

The number and character of the honours conferred will be announced later; also the appointment of the Jury of Awards.

Works of art must remain in the exposition until its close, unless removed by a special permit, signed by both the chief of the Department of Fine Arts and the director-general.

All works exhibited must be removed within a reasonable time after the close of the exhibition. They will be delivered only on the presentation of the original receipt.

The building for the Fine Arts is a bonded warehouse, and all works of art will be received within its walls subject to the inspection of the customs officials, but without the payment of duty. They will be received and sent out in bond. In cases where pictures or other works of art are sold, to remain in the United States in the possession of private individuals, duty will be paid in accordance with the customs laws governing such cases.

It is understood that artists, either native or foreign, becoming exhibitors, thereby accept the conditions stated above, and agree to comply in every respect with the above requirements.

TWISTED IRON IN FLOOR CONSTRUCTION.

AT the first meeting of the session of the American Society of Civil Engineers on the 2nd inst., a paper by Mr. E. L. Ransome on "Concrete Beams Reinforced by Twisted Iron for Floor Construction" was read. The system referred to consisted in embedding twisted bars of iron in the concrete beams, by which it was claimed a very strong floor can be made at small cost. The California Academy of Sciences, San Francisco, has five floors of the museum portion, or about 50,000 square feet, so constructed, and estimated to carry with safety 250 lbs. per square foot. The museum building of the Stanford University at Palo Alto, Cal., is being constructed as a monolithic structure, the foundation, walls, two floors and roof being of concrete and twisted iron. The building is 300 feet by 50 feet, with spans of 45 feet and less. The depth of beams ranges from 7 inches to 45 inches, with floors 3 inches thick. The concrete is of hard trap rock and Portland cement, in the proportions of 1 to 14 for walls and 1 to 6 for floors.

The paper gave rise to considerable discussion, evincing a sceptical feeling as to the advantages claimed. Mr. Seaman thought the twisting would be an injury rather than a gain, and that in case of fire the iron would stretch, and, owing to the difference of expansion of the concrete and iron, the effect of the latter would be lost. A visitor described a system of concrete floor construction in which a network of wires 1½ inches apart was hung from the top of the beams, and a flat floor of concrete made, extending a little above the beams and below the bottom of the curve of the wires, the thickness being about 4 inches for a span of 6 feet 3 inches. The wires are No. 12 gauge, and those from beam to beam are double. A thin, flat concrete ceiling protects the lower part of the beams, and the beams are also coated with the concrete mixture. This construction can be built by unskilled labour. Mr. Fouqué thought the use of sawdust in concrete or plaster for fireproofing material to be a mistake, experience on the West Shore R. R. having shown that it is completely destroyed by fire. Gauge mortar on wire lath gives very satisfactory results, but is expensive.

TESSERÆ.

Costliness in Architecture.

IN every production of human labour the influence of variety is limited by two circumstances, viz. by the costliness and the permanence of the materials upon which that labour is employed. Wherever the materials of any object, whether of use or of luxury, are costly, wherever the original price of such subjects is great, the influence of the love of variety is diminished, the objects have a great intrinsic value independent of their particular form or fashion, and as the destruction of the form is in most cases the destruction of the subject itself, the same form is adhered to with little variation. In dress, for instance, in which the variation of fashion is more observable than in most other subjects, it is those parts of dress which are least costly of which the forms are most frequently changed; in proportion as the original value increases the disposition to variety diminishes, and in some objects which are extremely costly, as in the case of jewels, there is no change of fashion whatever, except in circumstances different from the value of the objects themselves, as in their setting or disposition. Of all the fine arts, however, architecture is by far the most costly. The wealth of individuals is frequently dissipated by it, and even the revenue of nations is equal only to very slow and very infrequent productions of this kind. The value, therefore, of such objects is in a great measure independent of their forms, the invention of men is little excited to give an additional value to subjects which in themselves are so valuable, and the art itself, after it has arrived at a certain necessary degree of perfection, remains in a great measure stationary, both from the infrequency of cases in which invention can be employed and from the little demand there is for the exercise of that invention. The nature of the Grecian orders very plainly indicates that they were originally executed in wood, and that they were settled before the Greeks had begun to make use of stone in their buildings. From the period that stone was employed, and that, of course, public buildings became more costly, little further progress seems to have been made in the art. The costliness of the subject, in this as in every other case, gave a kind of permanent value to the form by which it was distinguished.

Cob Walls.

The cob walls of the West of England are composed of earth and straw mixed up with water, like mortar, and well beaten and trodden together; the earth nearest at hand is generally used, and the more loamy the more suitable. These mud walls are made two feet thick, and are raised upon a foundation of stonework. The higher the stonework is carried the better, as it secures the cob-work from the moisture of the ground. After a mud wall is raised to a certain height, it is allowed some weeks to settle; this period varies according to the damp or dryness of the atmosphere. The first layer or rise (Devonicé raise) is from three to five feet high, the next is not so high, while every succeeding raise is diminished in height as the work advances. The solidity of cob walls depends much on their not being hurried in the process of making, for if hurried they will surely be crippled and swerve from the perpendicular. It is usual to pare down the sides of each successive raise before another is added on it. The cob-parer (the instrument then used) is like a baker's peel—the shovel for removing the bread from the oven. The lintels for the doors, windows, cupboards, or other recesses, are put in as the work advances, bedding them on cross pieces. The walls are carried up solid, and the respective openings are cut out after the work has well settled. In forming these walls one man stands on the wall to receive the cob, which is pitched up to him by another below, the man on the work arranging and treading it down. Each workman generally uses a common pitchfork. The whole is then covered with thatch. Devonshire thatching is very superior to that in most parts of England. It is done with combed wheatstraw (Devonicé reed), which consists of the stiff, unbruised, unbroken stalks, which have been carefully separated by the thresher from the fodder straw and bound up in large sheaves called nitches. The outer walls are plastered the following spring, and this plaster covered with a whitewash of lime or rough-cast (Devonicé slap-dash). These are dangerous processes in the hands of a builder without a cultivated taste, for such a wall, to use the metaphorical language of Loudon, "has no beauty because it has no expression." The whitewashing this inexpressive cob pleases the eyes of ordinary tourists by the contrast it produces with the surrounding scenery, but it is condemned by the tasteful Gilpin as the most inharmonious of tints and productive of a disagreeable glare. That glare, however, is soon mellowed by the hand of time, and toned down by dirt and damp. The building then appears in most artistical and picturesque keeping. Rough-cast and slap-dash are terms which accurately describe the action and effect. The wall is plastered very smoothly with lime and hair mortar; as fast as this coat is finished a second workman follows with a pail of rough-cast, which he throws on the soft plaster. The materials for rough-cast are composed of fine gravel reduced to a uniform size by sifting or screening, and by washing the earth carefully out. This gravel is then mixed with pure, newly-slaked lime and water, till the whole becomes of the consistence of a semifluid; it is then forcibly thrown, splashed, slap-dashed upon the wall with a large trowel. The workman then brushes over the mortar and rough-cast with the lime liquid in the pail, so as to make all, when finished and dry, appear of the same colour. The building is then complete; this plaster and rough-cast gives the last finishing touch of beauty, the *coup de grâce*, to cob. It is like the sprinkling with comfits the sugary chalk plaster of the indigestible twelfth-cake, that confectionery cob. The real worth of cob, however, consists not in these outward charms, but in the intrinsic merits of the facility and cheapness with which it is made. It will cost, speaking roughly, about three times less than stone and five times less than brickwork; it requires, however, considerable time in the construction. A cob house of two storeys ought not to be built in less than two years, in order that the work may settle completely. Cob is extremely durable when protected from wet above and below, for, as Hamlet's grave-digger has it, "your water is a sore decayer." This is implied in the Devonshire adage, that "all cob wants is a good hat and a good pair of shoes." Instances occur of cob houses built in the time of Elizabeth being found at this day in perfect preservation.

Rusticated Masonry.

There are three principal kinds of rustication, called technically "frosted," "vermiculated," and "chamfered." The two former and least important consist merely in leaving or making rough the visible surfaces of the stones, except at the margins, where they are chiselled smooth; by the last method the stones, whether rough or smooth, are bevelled, or "chamfered," at their edges. All these devices have one main end, which is to exhibit the structure of the walls by marking the junctions of the stones, and to this end the third mode adds a capacity to express, by the depth or shallowness of the bevelling, different degrees of thickness in the wall, since the beholder naturally and instantly concludes that its thickness is always great enough to render insignificant the loss of power which is produced by cutting away the edges of its stones. Now there is no end to the variety of interest, though it may not be very high, and of expression, though not perhaps of the most subtle kind, which the Renaissance architects produced by this last species of rustic-work in wall surfaces, more especially in those of the basement storeys, of which the masonry is obviously required to be strongest and where, therefore, the chamfered mode is most appropriate. Most Renaissance basements are elaborately and successfully studied for this special object. The nature of a basement excluded, for the most part, the barbarous traditional decorations which were apt to disfigure the *bel étage*, thus freer scope was left in it for dwelling on intelligent arrangement and for displaying the living powers of gravitation and resistance in the stones. In the basement of the palace of Charles V. in the Alhambra, built by "the Spanish Michel Angelo," Alonzo Berruguette, every stone has its distinct office and is unlike the one next to it, yet the whole is simple in effect and capable of being comprehended at a glance. The basement of the Strozzi Palace, Florence, is divided by apertures into eight equal surfaces of wall, numbering in no case more than seven blocks, yet each differing from all the others in arrangement. It would require a volume to go through the constructive problems visibly solved in the exhibited masonry of the Renaissance. The practice of rustication would, we think, have been sufficiently justified had it stopped at the production of this excellent and essentially architectural effect, but the exhibition of masonry answered another and even more important end—one which was considered by the Greek architects of the best time as worth obtaining at a very large expense of labour. They polished the edges of the frustra of shafts so carefully that the junctions became literally invisible, but they were just as careful to mark the horizontal layers of the wall masonry. The Greek architect did this in order to render the wall a foil to the all-important columns by depriving it of all chance of being supposed to share in their activity. Now Renaissance rustication performs the same office of contrasting the naturally active expression of the shafts by the naturally passive expression of the wall, but the wall lines are commonly much broader and deeper than in the Greek, and are also perpendicular as well as horizontal, because the wall itself has an independent power and importance which in Greek architecture it had not. Mr. Ruskin objects against the system of displayed masonry that nature leaves her mountain bases smooth. Now if we were prepared to receive this doctrine of requiring antitypes in nature for all that the architect expresses by his work, we should still hold that the Renaissance architects were not thereby condemned in their common practice, which was to justify any unusual lowness in their edifices by an appearance of unusual massiveness, obtained by increasing the force of the chamfered rustication. We readily admit, however, that the

Renaissance method of giving expression to the wall is gross and tautological when compared with the Lombard system of wall decoration. The baldest wall is far better than a surface badly or unnecessarily rusticated, as it often was, in imitation of some Roman example or other, by the Renaissance architects, and as it commonly is, with no such excuse, by modern builders.

Byzantine Construction.

The early Byzantines made a bold and unmistakable effort to create a style of architecture in which the semicircular arch should afford, not only the main principle of construction, but also the theme of the expression. "Arches rising over arches and cupolas over cupolas, we may say that all which in the temples of Athens had been straight, angular and square, in the churches of Constantinople became curved and rounded, concave within and convex without." In this attempt to obtain expression from the arch there was necessarily involved a change that seriously impaired the beauty of every building in which it was made. The object of the circular arch is the distributed weight of the wall, just as the object of the column is the entablature, or the wall concentrated upon its capital, by means of the arch. The Byzantines, however, made the arch the chief object to the eye, setting little importance upon the chief object of the arch, and the consequence is that an unpleasant sense of imperfect purpose is experienced by the beholder of most of the edifices in this style. A great resisting power, and one which immediately declares itself as such to the eye, is constantly and ostentatiously displayed, and little is given it to do. The natural upshot of this system was that the power, wanting its proper object, took to displaying itself in fantastical tricks, of which perhaps the most famous and most foolish is the dome of Sta Sophia at Constantinople. The chief boast of this dome—that it looks as if kept from falling down by a miracle, appearing thereby to justify its fabled origin—is, as Mr. Ruskin says, its chief artistical defect; this defect is purchased at an immense expense of constructional convenience, and, after all, the wonder is but a lying wonder, for that which the uninitiated spectator gapes at as a vast mass of legitimate masonry unaccountably suspended in air is a structure of Rhodian bricks and pumice-stone, possessing only a small proportion of the supposed force of gravitation, and exerting a lateral thrust which is met by a vast and hidden buttress system. This species of falsehood attained its climax in the dome of St. Vitale, Ravenna, which, while it claims credit for being constructed of stones put together upon the principle of the all-prevalent arch, is in reality a kind of grotto, formed by a coil of empty earthen jars. In the Romano-Byzantine, or Lombard style, the semicircular arch was set to do its right work, and for the first time it then acquired its true expression, which was wholly subordinated to that of the wall.

Moorish Buildings in Spain.

The exterior of Moorish edifices in general was plain, prison-like and forbidding; the object was to keep out heat and enemies, foreign and domestic, and to keep in women and disarm the evil eye, the great bugbear of antiquity, the East, Andalusia and Naples. The interior—all light, air, colour and luxury—glittered like a spar enclosed in a rough pebble, and the door once opened ushered the Moor into a houri-peopled palace which realised those gorgeous descriptions that seem to our good folks who live in brick and mortar, quiet drab and Baker Street, to be the fictions of Oriental poetry or the fabric of Aladdin's genii; yet such were the palatial fortresses, the Alcazares, the Alhambras of the Spanish Moors, and such on a minor scale were their private dwellings, many of which still exist at Seville, although dimmed by ages and neglect. The generic features are a court hidden from public gaze but open to the blue sky, and surrounded with horseshoe-arched corridors, which rest on palm-like pillars of marble whose spandrels are pierced in gossamer lacework; in the centre plays a fountain gladdening the air with freshness, the ear with music, the eye with dropping diamonds; on the walls around was lavished a surface of Mosaic decoration richer than shawls of Cashmere, wrought in porcelain and delicate plaster and painted with variegated tints; above hung a roof of Phœnician-like carpentry, gilded and starred as a heaven, while the doors and windows admitted vistas of gardens of myrtles, roses, oranges and pomegranates, in which fruit mingled with flower and colour vied with fragrance. The drawbacks of this poetry and picturesqueness were miserable bedrooms, an utter want of judicious kitchens, sculleries, offices and other necessaries of modern comfort and cleanliness. The religious architecture of the Moor, of which the mosque of Cordova (still so called) offers an example unique in Europe, differed alike from that of the Pagan, the Christian, and even the Asiatic Mahomedan. It had neither the porticoes, the peristyles, nor the proportions of the first, nor the narrow aisles and aspiring loftiness of the second. It differed from those in Hindostan, Cairo and Constantinople in the absence of pagodas and domes and in want of external ornament. The mosque at Cordova was certainly the model of all the others in Spain from being the metropolitan and the substitute for holy Mecca. The exterior was simple, the plain walls being supported by square pilaster buttresses, but the mosaics of the interior rivalled those of Byzantium in richness and brilliancy, and there they sparkle unchanged after a lapse of ten centuries, the edifice, wherever the Spaniard has not meddled, being fresh as when first finished, so much more conservative is the dry air of Spain than are those who breathe it. The type was the Roman basilica, which probably was itself derived from the East; the shape is a wide quadrangle, whose low roof is supported by a forest of pillars, from whence the indicial horseshoe arches spring. An eye for symmetry and proportion was no quality of their architects. These columns, torn from earlier edifices, differed in diameter no less than material and capitals, but the Classical and Christian orders never entered into Moslem buildings without being shorn of their original meaning, fitness and beauty; architecture, chaste and pure, seemed to shrink alike from the voluptuous harem as from the sense-subduing temple of the false prophet.

Artists and Designers.

In the Middle Ages and at the period of the Renaissance the distinction between artist and designer had hardly arisen. The great German, Flemish and Italian artists were not only the painters of altar-pieces, neither were they employed alone in decorating the walls of churches with the history of saint and martyr, but they designed the furniture of palace and church, the rich services for the banquet, the reliquaries, monstrances, chalices, the splendid candlesticks for the altar-table, even the hangings of the rooms and the robes of the priests. The architects were often at the same time both painters and sculptors, and they did not disdain to design, and often partially to execute, the interior decorations of the buildings they erected. Some of the most celebrated sculptors were equally celebrated as workers in metal, as delicate modellers, or as skilful chasers; and their handiworks in bronze, in gold and silver are still treasured for us in museums and collections. But gradually the range of the artist became more limited; those who practised as painters or as sculptors ceased to follow the cognate arts; the artist ceased to be the art-workman. The manufacturer arose, and then, in most countries, the relations of art to industry were relegated to a separate and, as it soon came to be considered, an inferior class of artists. Yet it must be noted that all great improvements in taste may still be traced to the follower of fine art stooping once more to ally himself with the manufacturer, rather than to those who had started as designers for manufactures advancing to greater taste and skill in their branch of the profession.

Mechanical Structure of Limestone.

According to Mr. H. C. Sorby the only satisfactory method of ascertaining the true structure of limestones is to examine thin sections of them with the microscope. Limestones have been usually described as more or less crystalline or earthy, but this has reference chiefly to subsequent changes, and not to their original condition. When examined with the microscope it is seen that to describe them according to their mechanical characters would usually be far better. In this manner they may be very conveniently classed as organic sands or clays, in the same way that we may speak of felspar sand or clay. The organic structure of the minute fragments of which they are composed is often so well preserved that their nature and relative proportions can be satisfactorily determined. When they have been consolidated the shrinking of the mass has often produced cracks and joints, afterwards filled with calcareous spar, and often presenting a beautiful appearance when examined with the microscope on account of their number and regularity, and showing faults of 1-100th of an inch, or much less. These are totally distinct from slaty cleavage, which can be studied to great advantage in such limestones as have that structure. The rocks that possess it have been so much compressed, as is shown by a great variety of facts, that the positions of their ultimate particles would be changed in such a manner as give rise to precisely such structure as that which produces cleavage. That this would be a necessary result may be proved both by calculation and experiment. In the case of limestones it is impossible to suppose that any other than a mechanical cause can have developed the structure seen with the microscope, because the particles whose position has been changed are fragments of organic bodies and not crystals. Besides this change of position, in many cases minute organic fragments, whose original form and structure are well known, are greatly compressed in the plane of cleavage, as shown by the change in their form and structure; and even crystals of dolomite are broken up, elongated, and their crystalline cleavage planes bent, thus showing that the rock was in a consolidated condition when the change of dimensions occurred, but that the pressure was so intense and acted so gradually that the whole mass of rock gave way like iron malleable substances, by the movement of the particles one over another.

NOTES AND COMMENTS.

ONE of the most certain causes for grumbling in summer and other times is found in the over-watering and neglect of watering London streets. It may be well, therefore, to read what can be said on behalf of the district boards and other authorities who are charged with the operation. In his last report to the Board of Works for the Hackney District, Mr. LOVEGROVE, C.E., the surveyor, gives the following account of the difficulties in working the watering department:—"The more important thoroughfares are watered three times a day in dry weather, other roads and streets twice a day, and a few unimportant streets once a day. The work provided for each van and cart, and the number of vans and carts, are dependent upon the requirements of the division. About seventy horses are required for road-watering on most dry days. A road well watered, when under a dry wind and a hot sun, will throw up dust in less than an hour after being watered. Not infrequently all the vans and carts will be horsed, and shortly after commencing work a fall of rain will render further watering unnecessary. On dull days, if the whole of the vans and carts keep on work, the roads are made muddy, and more harm than good is done. During the season there may also be from thirty to fifty damp or wet days when watering is not required at all, and most of the horses and men will consequently have nothing to do. The result of this is that the carmen frequently leave, and there is a constant succession of new men strange to the roads; then, notwithstanding the most careful supervision, the work is indifferently done. The whole matter is thus beset with difficulties." The report from which the extract is taken is the thirty-fifth presented to the Board by Mr. LOVEGROVE. It is not often so long a tenure of any important public office is witnessed, and the collection of reports will form an infallible record of the progress of the district.

JUDGMENT has been given by Sheriff BLAIR in the action commenced by the late Mr. JOHN RHIND, architect, Inverness, against Sir JOHN RAMSDEN, Bart. The account in dispute was incurred in connection with the building of Ardverikie Castle. The defence was that the architect greatly overcharged, and that there was a contract between the parties stipulating for a lower rate of commission. Sheriff BLAIR has decided that the sum of 2,300*l.* is the fair value of the work done by Mr. RHIND specified in the account sued for, and that 1,600*l.* has been paid to account. He gives judgment against Sir JOHN RAMSDEN for the balance, and finds that the defendant has failed to establish his claim for damages.

WE have several times referred to the commission undertaken by the late M. MEISSONIER for the production of a panel which was to form part of the decoration of the Panthéon. At the time when the scheme was proposed the building was used as a church, and accordingly it was arranged that the paintings should represent scenes in the life of St. GENEVIÈVE, or ecclesiastical events like the crowning of CHARLEMAGNE. To M. MEISSONIER was assigned *St. Geneviève saving Paris from Famine during the Siege by the Franks.* That he should accept the commission amazed his friends, for the figures would have to be on a large scale, and he could not paint one successfully that was a foot in height. Such power as he possessed failed him when he went beyond works in miniature. M. MEISSONIER appeared to realise to some extent his incompetence, for a long period elapsed without a sketch appearing. At last he sent one to the Minister of Fine Arts, but it bore no relation to any of the legends of St. GENEVIÈVE, for the subject represented was the siege of Paris in 1870-71! The Minister expressed disappointment, which gave occasion for a display of M. MEISSONIER'S choler. After a time he proposed to fill the panel with a composition that would suggest the triumph of France, who was to appear on a chariot, in the form of a pretty woman, drawn by lions, and accompanied by Prudence and Force. As M. MEISSONIER never succeeded in painting a female figure, he was planning failures for himself. The description of the work pleased the official mind, and the composition was approved. But the death of the artist occurred before the work was really commenced. It is now proposed to carry out the design by other hands. Applications are invited from artists, and whoever is selected will have to realise M. MEISSONIER'S design without any alteration, because it gained official approval, or will have to interpret in his own way the subject originally proposed to M. MEISSONIER, that is, the siege of Paris. It is needless to say that any artist who has gained reputation will prefer the alternative scheme.

A SECOND edition of Mr. LEWIS F. DAY'S manual on "The Application of Ornament" has been published by Mr. BATSFORD. There is little difference between the two editions, which is an advantage. Fortunately there was nothing in the little book when it first appeared that might be considered as compromising to the author as an official examiner of the Science and Art Department, and in consequence the pages do not reveal any sacrifice of the original plain speaking. There are a few most trifling alterations, as in the case where Mr. DAY wrote, "The Corinthian capital and the acanthus scroll, even when they most nearly approach nature (which is never very closely) are always modified according to the conditions of sculpture," which sentence is now altered in this way, "The acanthus leaf, whether in scroll or capital, and when it nearly approaches nature," &c., which is somewhat more precise. As Mr. DAY thought out his subject before he contemplated his book, there were not many opportunities for emendation. It is needless to again describe the character of the chapters. Mr. DAY writes frankly as a designer to designers, and his pages not only explain a rational method of applying ornament, but also point out by apt allusions the obstacles which arise from defective theories, fashionable whims, and an unsatisfactory business code. Everything in the book is to the purpose, and it would be easy to have utilised the materials for a much larger volume. By the production of such a series of text-books Mr. DAY has well served his countrymen who are art students, not only by presenting the results of his own experience as a designer, but by a suggestiveness that must compel them to think.

THE villa which has been erected at Villefranche-sur-Mer for the Marquis of SALISBURY has furnished M. GASTON POLLONNAIS with a subject for description. He says the site is not accessible, and consequently, curious people who wish to visit the place will suffer some restraint. There is also a board inscribed "Défense d'entrer." The Marchioness, it appears, prepared the plans, and the result is, says M. POLLONNAIS, a curious mixture of British comfort and southern romanticism. The house is of two storeys, and there are twelve small square windows in the façade. On the first floor, which has an exterior gallery, are the dining-room, salons and billiard-room, all of them being spacious and communicating with one another. They are arranged to allow a very free circulation of air. On the second floor are the bedrooms. There is a small tower in the Italian style, having a belvedere from which views of the glorious landscape around can be enjoyed. Wall-papers have been rigidly excluded, and the walls are painted in oils. Most of the accessories of construction and the furniture were obtained in France. "If I were indiscreet," adds M. POLLONNAIS, "I would speak of the letters to the contractors from the Marchioness of SALISBURY, which might serve to form the manual of a perfect architect." It is needless to say that all the workmen employed are enthusiastic about the abilities of their *patronne.*

THE whole of the share capital, amounting to 150,000*l.*, having been subscribed for by 1,200 shareholders, it has been arranged to lay the foundation-stone of the Blackpool Eiffel Tower on Friday next, the 25th inst. The architects are Messrs. MAXWELL & TUKE, of Manchester, who are now engaged in preparing working drawings. An effort will be made to have the structure completed in order to be utilised in the summer of next year.

THE architecture of Exeter is well illustrated, and on a large scale, in one of the pictorial series now being brought out by Mr. J. L. ALLDAY, of Birmingham. The cost of the new folio is a shilling, and it is rare to find so much value given for so small a sum.

NEW PREMISES FOR MESSRS. BOLDING & SON.

THE building designed by Messrs. WIMPERIS & ARBER to accommodate the extending business of Messrs. JOHN BOLDING & SONS, in Davies Street, Oxford Street, was lately opened. It has been arranged so that all the departments, with one exception, can be engaged under one roof. In that way there is security that the best work will be brought to perfection, as the superintendence can be thorough and comprehensive. Thus the sixth floor is occupied by the marble masons, who prepare the highly-finished lavatories, baths, &c., and the fifth and fourth floors by the engineering department, brass fitting, &c. The ordinary gloomy workshop is transformed into a bright, sunny, airy, comfortable room, that would satisfy an artist. The top floors communicate with show-room basements by means of a large lift. An iron staircase fire-escape is accessible from every floor, and the whole building is fireproof. In the show-rooms all the different patterns of closets, for instance, some hundreds, can be placed side by side, and as the water is connected, a practical illustration of the merits of each is given. The "Simplex" and the "Kenon" are the two best known, and are in universal use. Baths of different sorts and sizes are also grouped together, at prices to suit "all sorts and conditions of men," and it is surprising to see how cheap some of these luxuries are—a porcelain lined bath, for instance, with shower fittings attached, for 8*l.* 15*s.* The different kinds of urinals are placed together—automatic, treadle and otherwise—including the patent "Simplex" disconnector, one of the latest improvements. A small department is devoted to electric light fittings, &c.

THE PITT-RIVERS MUSEUM.

A CORRESPONDENT of the *Times* gives the following account of the Farnham Museum:—The correspondence which has arisen upon the subject of county museums has drawn attention to the existence of many such institutions in various parts of the country, and has raised high hopes of future developments in the breasts of many local archæologists and antiquarians. If the village council be held, as it is by some, to be the logical outcome of the county council, by parity of reasoning the village museum should also be a reformer's end. This is an amplification of the leading idea which does not seem to have presented itself as a rule, but a precedent already exists in the loneliest, most sparsely-populated corner of North Dorset in a tiny village called Farnham. It is the last place in the world that one would expect to find so advanced a product of civilisation and culture, and one's wonder is only increased at learning that it is as freely open on Sundays as during the week. It is the public-spirited gift of General Pitt-Rivers, F.R.S., to his tenantry and neighbours, and so far from being "a shooting-place for all rubbish," as it has been irreverently suggested that the local museum would become, it contains the results of the General's scientific researches into the abstruse question of the Romano-British occupation of the south-west of England, in addition to an extremely interesting collection of artistic, industrial and agricultural objects.

The history of this novel experiment is soon told. Before General Pitt-Rivers presented to the University of Oxford the art and anthropological collection which there is associated with his name, he reserved for his own purposes such objects as he considered might possess an educational or improving meaning for rustic eyes. The opportunity to put his theories into practical shape arose when he inherited, as next heir, the Rushmore estate on the death of the last Baron Rivers in 1880. Farnham itself, with a population of about 200, lies about two miles from Rushmore Lodge, the residence in the palmy days of old Cranborne Chace of the chief ranger. The nearest towns to this most typical Dorset parish are Shaftesbury and Blandford, both of which are eight miles distant, while Wimborne is eleven and Salisbury seventeen miles from it. Curiously enough, Farnham some thirty-five years ago had been the scene of another essay in advance of the times, and a large school had been built and partially endowed by several of the squires and clergy for the reception and training of gipsy children. The institution struggled on for a few years against the dispiriting behaviour of the nomadic parents, who were willing enough to leave their children to be comfortably housed during the winter, but insisted on taking them away for the summer months. When the effort was finally abandoned, the house, which was a capitally-built one, with large and well-planned rooms, remained vacant until it occurred to General Pitt-Rivers to use it in another way for the benefit of his poorer friends.

The collection most strongly appeals to local sympathies. Standing as it does in the very centre of the district from which General Pitt-Rivers has made his most striking anthropological discoveries, these naturally occupy a leading place in it. Nor is it surprising that the rustic of the villages round should take an intelligent interest in seeing the results of these researches, for he has known that they have been patiently carried on upon the chalk downs, and the names of Woodcutts and Rotherley are perfectly familiar to him. Moreover, with the close intermarriage of village families and the direct personal acquaintance he has with his neighbours, he has heard quite enough about the investigations to realise that biographical element which Mr. Herbert Spencer tells us is so essential to sincere interest in the uneducated mind. Once enter the museum, and every point is so clearly brought forward that the veriest dullard could not fail to understand it, even if he had not ever seen the actual field of the discoveries. Diagrams and models illustrate the exact spot in which every bone or coin or vase was found. A concisely-written, clearly-printed label explains exactly what every object is and its use to those who made it. In the case of animals' bones, further light is thrown upon the subject by judicious comparison, and the rustic sightseer grasps a point when he sees placed side by side with them the pictures of their nearest modern type. For instance, the Exmoor pony may be taken as a close approach to the horses used by the Romanised Britons in this district, the Kerry and Alderney cattle convey a fair idea of the size and stamp of their oxen, and the very light-limbed sheep of St. Kilda and the half-wild Dorset horned sheep from the open heath country verging upon the New Forest represent their sheep. A curious fact about the wheat grown by the Romano-Britons has been proved by General Pitt-Rivers, and is, of course, amply illustrated. In the barrows of pre-Roman days the grains found by him were of minute size (655 grains to 681 grains to the cubic inch), but in those of the joint British and Roman period of occupation they were vastly improved, and the record of 323 grains to the cubic inch found in the Woodcutts barrow is the same as that made by the present tenant upon whose farm the barrow stands. Of course there are quantities of metalwork, weapons, pottery and coins, for every fragment discovered was carefully examined, and not a stone or a shred of wood that would give the slightest suggestion of human handicraft was passed by, and the result is that one can judge exactly the degree of civilisation possessed by the curiously small race who lived upon this range of chalk downs and in the woods of this part of Dorset and Wilts. Their average size is conclusively shown here not to have exceeded 5 feet 2·6 inches for the males and 4 feet 10·9 inches for the females, but whether they were the last survivors of the neolithic population as they were driven further and further westward, or the remnants of the sturdier race of true Britons, even the Farnham Museum does not attempt to decide.

But anthropology is only one section of this well-planned little institute. It is perhaps the one on which the educated visitor dwells longest, on account of the marvellous patience and careful deductions which General Pitt-Rivers has revealed, though beyond it are the rooms filled with specimens of curiosities, needlework and china most likely to awaken interest in rural minds. Several typical national costumes are shown. There are examples of the brutal man-traps that were frequently used by the keepers on the Cranborne Chace for the protection of the deer against the daring poachers; but unfortunately there is not a suit of the leather and straw basket-work worn by these guardians of game rights and sport. The development of the local, or "Verwood," pottery, from the rudest baked clay up to comparatively good glazing and improved form, is shown, and there is a really interesting collection of "tithe" mugs, with their rhymes none too friendly to the parson, as valuable in its way as Mr. Willett's extraordinary assortment of crockery relating to the navy and its heroes in the Nelson Gallery of the Royal Naval Exhibition. "Puzzle mugs," too, are there in several quaint forms, and there are several very good pieces of Breton carved oak furniture as an object-lesson in peasant handicraft. Cooking utensils, old and new, English and foreign, also find a place, while the collection of homely needlework does not ignore the smock-frock or the samplers with square trees and halting verse worked in cross-stitch. Outside, in the trim, well-kept grounds is a long shed filled with primitive agricultural implements collected from all parts of the world, literally from Scandinavia to the Malay Islands.

It would be giving an incomplete account of the museum if

its two auxiliary attractions were not also noticed. At a short distance from Farnham is the village of Tollard Royal, not wholly unknown to antiquarian fame, on account of possessing in its little church the monument to Sir William Payne, who died about 1388, which is one of the only five examples known of banded mail. In this parish stood an old farmhouse, traditionally associated with the name of King John, but having little external evidence of age about it. However, it chanced to fall vacant, and a careful examination was made of it. Evidences of indisputable Tudor work soon revealed themselves, and some fine Elizabethan windows clumsily bricked up were found. In investigating these a yet more interesting discovery was made, of a thirteenth-century window with stone seats closely resembling those in Acton Burnell Castle, and similar to those in the room of Lochleven Castle in which Mary Queen of Scots was kept a prisoner. Among the curiosities discovered in the process of restoration was a spur, almost a facsimile of the one upon the effigy just mentioned in the church close by, and a coin of Henry III., which were proof that a dwelling-house existed here in the succeeding reign, and gave decided support to the legendary connection with His Majesty of Magna Charta memory. This house, with the beautiful Stuart oak-panelling on its walls, which had been buried under stucco and paint, now has one room devoted to the villagers of Tollard as a reading and recreation-room, while the rest contain some seventeenth-century carved oak furniture, and a collection of pictures to illustrate the history of painting, from its origin on Egyptian mummy cases up to the present day, and including examples by Margaritone, Jerom Bosch, from the schools of Florence and Siena, by Sassaferati, Rubens, Quintin Matsys, Tintoretto and George Morland. Some odd specimens of the old "stump" embroideries are also here. At a few hundred yards' distance from this stands an historic old wych elm, marking the juncture of the two counties, and known as the Larmer tree. It is supposed to have been the meeting place for the chase in earlier days, but it has now been made the centre of a charmingly-planned pleasure garden, at which, on Sunday afternoons, the band, conducted by the village organist, and entirely composed of the labouring men from the two parishes, plays a selection of music between 3 and 5 o'clock. Flower beds and seats abound, and one of the treasures of the garden is a bronze, given for it by the late Sir Edgar Boehm, of *The Savage Hunter*. Naturally the first question asked after a visit to these three places is, "Do the people come to them?" They are, of course, open free, the only condition of entry being a signature in the visitors' book. Last year's books showed that 6,500 people had been to the museum, 14,300 to the Larmer tree, and over 3,000 to King John's house, which was not open until May. The same names recur constantly, and the behaviour and order have been perfectly satisfactory. That is an all explaining answer, and the fact may certainly not be without its value in the present discussion upon the question.

A LEASEHOLDER'S LAMENT.

THE following epistle from Mr. C. Thorp appears in the *Times*, and suggests the kind of opinion which prevails in London about some classes of house property:—

In these days of suffering and impoverished landlordism, it must be cheering to that down-trodden race that the wheel of fortune sometimes gives a half-turn in their favour. From the days of the ungrateful servant in the parable, it has always been clear that a certain grim pleasure, arising probably from the sense of power, lies in the oppression of others. A leaseholder smarting under a recent infliction, justified by the law, may, through his solicitor, be excused in the dull season if he endeavours, by a narration of his wrongs, to interest the holiday-making public, and warn investors in respect to leasehold investments.

A covenant to repair has not many terrors for the well-to-do residential leaseholder. In the first place, the landlord seldom raises any question during the term of the lease, and that for two reasons. The pride and self-interest of the tenant forbid him to let the premises deteriorate, and the landlord can drop upon him for that mysterious thing called dilapidations at the end of his lease, when a new tenant looms into view. But it is different with that class of property which is purchased as an investment, and intended to be sublet either to quarterly, monthly or weekly tenants. These are not responsible persons; they are a nomadic race, and they are not bound to repair. They construe this exemption liberally. If they do not make firewood of the doors and the floorboards, their immediate landlord feels a thrill of gratitude. But, even short of this, property of this class very seldom remains long in good order. Whatever their landlord (that is, the unfortunate leaseholder) may do in the shape of repairs is speedily undone by his kaleidoscopic tenantry. Like the Laureate's evanescent humanity, they come and go. The woodwork is treated with a rough familiarity, to which it soon succumbs. Paintwork does not escape unscathed; wall-papers hang in picturesque ribbons; sanitary works, pipes and such like, are looked upon with hearty contempt; at any moment it is safe to assert that the repairing covenant is in a condition of breach; and here comes the opportunity for the ground landlord to make his legal "pounce" just as if he were a First Lord of the Treasury manipulating the closure rules.

Up to the year 1881, the penalty for letting property get out of repair where the lease prescribed the obligation to repair, and where there was (as was almost invariably the case) a power to the landlord to re-enter on breach of covenant, was of Draconic simplicity and severity. The landlord could put an end to the lease and eject the tenant. The fact that the lessee had spent hundreds of pounds on the land under the superintendence of surveyors, that the lease comprised many houses underlet to several under-lessees and sub-lessees, and that the defect of repair only existed in one of them, availed nothing. Immediately the want of repair was verified, the right of the landlord to resume his absolute proprietorship over all the property arose; he could bring actions of ejectment; and perfection of repair when the actions came on for trial could not be set up as a defence, the breach of covenant being incapable of a healing process of this kind. Having regard to this state of the law, it is astonishing that it was so seldom taken advantage of by landlords. Perhaps there were two reasons for this—one, because the obloquy attaching to such an obvious piece of robbery deterred even those who would not have been restrained by mere morality; and, secondly, because a landlord who adopted such a course might find it difficult to procure future tenants. There was, of course, another remedy; to bring an action for damages for breach of repair, the result of which was, as a general rule, that the repairs were put in hand, the costs of the landlord were paid and the action stayed.

Although, as has been said, the instances in which an unfair advantage was taken of a neglect to repair were few, there was a want of security for lessees which induced the Legislature to interfere. A section of the Conveyancing Act of 1881 stays the enforcement of every landlord's right of re-entry for breach of covenant until he has given notice specifying the breach complained of, and requiring the lessee to remedy it and make compensation for it, and it is only on non-compliance for a reasonable time with these requirements that the landlord is permitted to proceed to recover the land. Furthermore, even on default by the lessee, the Court can relieve the lessee from forfeiture on such terms as it may think fit. There are a few exceptions, which need not now be noticed, to the range of covenants to which the section applies.

On the face of them, these provisions appear highly beneficial, and in many cases their operation is, no doubt, such as the framers of the Act intended. But in other cases, and notably in the case of weekly properties, no such result follows, a proceeding by a landlord in conformity with the Act brings no obloquy upon him, and moreover, in the majority of instances, the sufferings of the tenant are not brought to the light of publicity, and, as a matter of fact, the working of the Act is attended with positive disadvantage to many deserving lessees.

This operation may be thus succinctly stated. The landlord gives the statutory notice. The lessee takes immediate steps to put the property in repair in accordance with his covenants. Suppose the property is a weekly one. In November, perhaps, he has, as he considers, so dealt with the property—under the careful superintendence of an experienced surveyor—that no fault can be found with him. But what is the course of the landlord? He will not allow his surveyor to inspect the property immediately the tenant has repaired it. He knows that a winter is fast approaching and that if it should prove a severe one it is probable that, with the active and unstinted assistance of the occupiers, the property will necessarily run down. In February, perhaps, the landlord's surveyor inspects the property. He then, of course, finds numerous defects of repair; the "reasonable time" has expired; the breach so called (not the breach mentioned in the notice, it is to be observed, but a new breach altogether) is unmistakable. A writ of ejectment follows. What is the lessee to do? He may possibly be advised to go to trial and assert that he fulfilled the conditions of the statutory notice under the superintendence of an experienced surveyor. But *primâ facie* he is in the wrong, since at the moment when the writ was issued the property was certainly out of repair, and a war of testifying surveyors is an expensive procedure. So that probably he will be recommended by his advisers to apply for relief from forfeiture under the statutory discretion given to the Court. He does so, and thereby inevitably admits himself to need relief, and, consequently, that he is in the wrong. Then begins a conflict of evidence on surveyors' affidavits. Of course, according to an immutable law, they see with their employers' eyes, and their views are irreconcilable. The learned judge finds himself bewildered. If A says a wall is in perfect, even superfine, condition, and B says it is ruinous, how is the most experienced judge to decide between them? True, he may go and inspect the wall; but it is rather too much to call

upon Her Majesty's judges to go tours of inspection of this kind, to the purlieus of the East End, it may be, to some secluded suburb, or even further. So his lordship exercises his discretion, and wisely exercises it, by appointing an official surveyor to examine the premises and make his report. He does so, and no doubt fairly. But of course he differs from both the other surveyors. Well, the report comes to the judge, who perforce adopts it, and orders the official surveyor's directions to be carried out. The hapless lessee does so to the best of his ability, and after two or three unsuccessful efforts the official surveyor is satisfied, and all seems in train for settlement. These various proceedings, however, are not carried through as a labour of love. Neither lawyers nor surveyors argue and inspect, wrangle and report, for nothing, and if a considerable amount of costs and expenses have been incurred which are inevitable, somebody must pay them. There is no national fund for the purpose. The landlord is technically and legally in the right. The lessee has, but for the terms of the Act of Parliament, incurred forfeiture. The judge has power to relieve forfeiture "upon terms." What terms shall he impose? That is a question entirely for his lordship. But if he orders the unfortunate lessee to pay all law costs and the expenses and fees of the three or more industrious and able surveyors, can it be said that the discretion is not well exercised?

What, then, is the remedy? One drastic and unfailing remedy for himself the impoverished lessee will probably apply at once, by selling his well-repaired property, and registering a secret oath that he will never more seek leasehold investments, and will even prefer the securities of the Argentine Republic. For there is a *da capo* principle in the procedure which has been described, and a legal war at somebody else's expense is not without its charms. But there is another remedy, which many persons of well-regulated minds have shrunk from as a species of confiscation, and this is the principle embodied in the Leasehold Enfranchisement Bill, and an oppressed lessee can scarcely be blamed if he becomes converted to this principle. Vacuous of pocket and harassed in spirit, he may, though perhaps no longer a leaseholder himself, look complacently at the litigating landlord being bought out at a valuation, and will not sigh if it be a low one.

ST. MARY'S ABBEY, DUBLIN.

AN obscure street in a very poor part of our city, a few fragments of broken walls, a ruined arch or two, the remains of an ancient and once beautiful apartment, such and such alone, says an able correspondent of the *Irish Times*, are the sole surviving relics of an institution once great and famous and rich. All that is left to us now in the closing years of the nineteenth century of what was for centuries one of the most splendid and most renowned of Irish monastic foundations—"the ancient and noble Abbey of St. Mary, near Dublin," sometimes called the Monastery of St. Mary, Ostmantown, since the Abbey buildings spread over a part of that fair suburb of old Dublin town anciently known as the "faire green Commune," or Village of Ostmantown, on the northern bank of the river Liffey. In this same village of Ostmantown, or as we now say Oxmantown, there was situate a parcel of ground known as "The Pill," being part of the estate (so we read) "of the Honourable City of Dublin," which part, it is worth while to add, was let by a lease for ever, dated May 20, 1662, to James, Lord Baron of Santry. Along the eastern side of this "parcel of ground" is to be found the ancient site of the walls of St. Mary's Abbey, which passing from the angle of Johnson's Alley to the west corner of the Watchhouse of St. Mary's Parish, on the south side of Little Strand Street, terminated at a point on Upper Ormond Quay near the corner of Capel Street, and a few yards above Essex Bridge. Over this extensive portion of ground stood the great monastery. The demesne attached to the Abbey has been defined thus:—"Commencing at the entrance gate near the corner of what is now Pill Lane, it extended south through White Lyon Court to the river, and north through East Arran Street, Green Street, Henrietta Street, and included a large and now undefinable area towards the last." If the buildings and the surrounding demesne of this famous religious house were extensive and splendid, its temporal possessions would seem to have been equally great, for we read that its broad lands were to be found in half the counties of Ireland, and these, the gifts of its rich and pious benefactors, yielded to the abbey a yearly revenue which was in truth no mean income. The story of this historic abbey is the story of every human institution. It sprang into existence, lived its little day and in due course perished, leaving as its heritage only a memory, and here and there a trifling vestige to attest to the generations to come the very fact of its existence and its importance in the history of the land. Whence came this famous monastery we know not. The date of its foundation, the names of its founders are wrapped in the thick darkness of the long distant past. Tradition, conjecture or speculation on the subject are rife enough. It has been said that "the credit lies between an Irish king, a Leinster chief and the Danes," and to each of these originators of its being there is attached a certain amount of plausibility in behalf of their several claims. According to some native historians the Irish king just mentioned was Melachlin, or Malachy the Great, the first of that name, who was monarch of Ireland, whose reign commenced in A.D. 846, according to the annals of Innisfallen, or one year later, if we can believe the "Four Masters," and who died in 862, while in an ancient MS. entitled "Triumphalia Chronologica S. Crucis," written by one Father Hartry in 1640, the origin of the abbey is ascribed to "Malachy, King of Meath and Ardrigh of Ireland, and Gillemoholmac and Rose, his wife, who were vassals of the aforesaid king, and dwelt at the time on the very site of the monastery." On the other hand, however, many historians and writers cling to the opinion of a Danish foundation. The fact of its being situate in the Danish colony and district of Ostmantown lent considerable colour to such a theory. Thus argues Archdall, adding as follows:—"It is not likely that the native Irish would attempt to establish a religious house in the vicinity of foreigners with whom they were usually in a state of warfare." Against this, however, must be set the fact that, so far as we know, the Danes did not until the year 948 embrace the Christian faith, and we learn on authority that the second abbot of St. Mary's died forty years before that date, namely, on January 19, 908. Equally uncertain and defective is any record of the names or period of rule of the earlier abbots. We are told that the name of the first abbot was James, and that he died on January 11, but history is silent as to the year in which his death took place. The death of the second abbot occurred, as we have just said, in 908, yet from that time to the year 1113, a period extending over upwards of two centuries, history is again absolutely silent as to the existence of the abbey or those who dwelt within its walls. In 1113 we read that the "Abbot Michael died," while in 1132 Abbot Everard, "an Ostman" (or Dane), died on April 10. M'Gregor, in his "Picture of Dublin," published 1820, cites this special mention of the Danish abbot as an argument against the theory of a Danish origin, "for," he says with some reason, "if the Danes were the founders it is more that probable the abbots would be of that nation, and therefore it would not be noted as an extraordinary occurrence that this abbot was an Ostman." From the death of this Abbot Everard to the final suppression of the abbey in 1537 the list of abbots is apparently complete. In 1238 the following is recorded in the annals of the house:—"1238, Felix, Lord Archbishop of Tuam, of pious memory, died, who caused the church and steeple of our Blessed Lady's House near Dublin to be covered with lead, and was honourably buried in the chancel of the same church at the steps of the altar, on the left hand." This ecclesiastic was Felix O'Ruadan, and uncle to King Roderick O'Connor. Resigning his See in 1235, he retired to spend the remainder of his days in St. Mary's, Dublin, and, as we have seen, died there. Long, long afterwards, in the year 1718, it is said that there was discovered by some workmen, while digging in the ruins of St. Mary's Abbey, the uncorrupted corpse of a prelate clad in full pontificals. Lynch, in his "Life of St. Patrick," records how the remains were supposed to have been those of Archbishop Felix O'Ruadan, and how, when the then Protestant Archbishop of Dublin, Dr. King, was consulted as to what was proper to be done, his reply was, "that it would be a pity to dispossess the honest gentleman of the place he held for so many years peaceable possession of," and so the body was reinterred again in the same place, and not removed to St. Mary's parish churchyard as some persons had advised. In the later operation made a few years since for the purpose of tracing out the plan of the old buildings of the abbey this interment was not found, though we are told that many indications of ancient graves, both within and without the building, were plainly to be seen during the exploration of the ancient floorings. Speaking of these later excavations, we must add that they were undertaken in the year 1886 by some gentlemen who owned property in Mary's Abbey and Meetinghouse Lane, with a view to the investigation of the few remaining fragments of the great buildings of the old monastery. To these investigations, undertaken in the cause of historical and archæological interests, we owe our present knowledge of what the plan of the ancient abbey must undoubtedly have been. We know that from its foundation to the year 1139 the abbey was under the Benedictine Order, but in this last-mentioned year it was granted to the monks of the great Cistercian Order, then rapidly rising to such splendid pre-eminence among the religious orders of the Middle Ages, and the Benedictine Friars were compelled by the Pope's legate, Malachy O'Morga, to conform to the Cistercian rule. Previous to this, in 1304, a fire had destroyed the abbey, together with its church and steeple. Some idea may be gained of the position which this great religious house occupied at that time by the fact of its being the repository of

the Rolls of Chancery, all of which, to the twenty-eighth Edward I., we learn, were burned in this self-same fire, except two of that year, which were in the hands of the Chancellor. While speaking of the dignity of the abbey it may be added that the abbot sat in Parliament as a baron of the kingdom, and was third in rank among his order. Of the buildings which the Benedictines had erected no trace now remains. So far as recent research has resulted, it is the unanimous opinion of those most competent to judge in the matter that all that now exists of St. Mary's Abbey proves it to have been built, or probably after the fire rebuilt, in the purely Cistercian method. But before we speak of St. Mary's as it now is, it is well worth while to turn aside for a moment and glance back at the history of that great monastic Order which in the Middle Ages, and for subsequent centuries, attained a power and magnificence throughout Christendom scarcely, if ever, equalled by any similar confraternity. To the Cistercians, those monkish builders of Mediæval times, England owed the buildings, even at this moment unsurpassed, which made the Cistercian monasteries of Bolton, Fountains, Furness, Rievaulx and others throughout the land the wonder and admiration of generations, even to the close of the nineteenth century. An offshoot of the Benedictine Order, the Cistercian, arose in Western France towards the close of the eleventh century. From three brothers of the abbey of Molesme, in Burgundy, who, much distressed by the laxity and low tone then so prevalent in the Benedictine Houses, finally withdrew themselves from the monastery to which they were attached, and seeking a resting-place in a deserted district in the diocese of Chalons, established there, in the year 1098, under the protection of Otho, Duke of Burgundy, a little religious community known as the Convent of Citeaux, this great and powerful Order had its being. The rule of life differs from that of St. Benedict, though founded upon that Order, in being from the first infinitely stricter and more rigid in its discipline. Ultimately, the Order departed almost entirely from the original rule of St. Bernard, and in this change, which took place about the end of the thirteenth century, we find also that great and lasting differences arose not only in the internal economy of their houses, but also, and very markedly, in the actual structure of their abbey buildings themselves. Previous to this, however, the Order had begun to increase both in numbers and in reputation in a manner extraordinarily rapid. In the two centuries which followed 1,200 abbeys were built and endowed, while it is said that at the time of the Reformation the entire number of dependencies possessed by the Abbot of Citeaux had reached 3,200. It was in the twelfth and thirteenth centuries that the especial capacities of the Order in architectural achievements came into notice. To that period belongs all that is best of their building work. Speaking of the peculiar and distinguishing characteristics of their work, one writer on the subject has said :—"I do not know one (*i.e.* one monastery) the general plan of which is not in accordance with that of all the rest, nor a single church which does not bear in its details the impress of its Cistercian origin. . . . Variations occur, as a matter of course, but they are mostly of slight importance, and are, in fact, of the nature of those exceptions which tend rather to prove the rule than to invalidate it." The writer goes on to say :—"The first thing that strikes us on approaching one of the abbeys of the Cistercians is the nature of its site. They appear to have invariably selected remote situations, at a distance from towns—generally in a valley, and in the narrowest part of the valley—with a view apparently to complete retirement and seclusion. In France and Germany this appears to have been the almost invariable custom of the Cistercians. In England situations of this kind were perhaps more difficult to meet with ; still, I know of no single instance in which this general practice has been departed from, or the valley deserted for the high land." Now, as we come back to that Cistercian abbey which in the days long dead stood so proudly looking across the river which swept beneath its windows to the ancient city of Dublin, we can see that the monks of St. Mary's departed in nowise from their English and foreign compeers in this respect. They sought a quiet and sheltered seclusion ; they could find such in the old Danish village on the northern bank of the river Liffey. Let us remember that not for many a year after the edict had gone forth which robbed the abbey of its revenues and emptied it of its inhabitants was the ground lying north of the river (now so densely populated) enclosed or built upon for human habitation. During all the years that St. Mary's Abbey flourished as a great religious community only one parish church existed in what we now call the north side of Dublin. This, the old Danish church of St. Michan, stood also in Ostmantown, and it is said, with what authority we cannot say, that between this church and the old abbey there ran a subterranean passage which communicated each with the other. But peculiarity of situation was accompanied in Cistercian foundations with certain fixed peculiarities of structure. Almost all their buildings had certain broad features in their erection and arrangement common to all.

Thanks to the extensive investigations of 1886, we can now see all that remains of the once famous monastery of St. Mary's, while we are further enabled to picture to ourselves a Cistercian abbey as it must have appeared to the citizens of Dublin six centuries ago. And to set such a picture before you now we cannot employ any better method than by recapitulating the results, already published in one form, attained by those latest investigations. Of these the most interesting and important result was beyond question the discovery of the ancient chapter-house. This, according to an account subsequently printed and published, was much as follows. In investigating the relics of the abbey the visible portion consisted of an apparently new store opening off Meetinghouse Lane. This was thrown open to the investigators by the proprietor, Mr. George Alexander. There, passing by a few steps from the level of Meetinghouse Lane, was found "a low-roofed but spacious apartment about 43 feet long by 23 feet wide, with massive walls 4 feet thick. It was further found that the roof was semi-circular, formed with interlacing ribs of moulded stone of some delicacy and beauty, with curious carvings at their intersections. It was evident that the floor was not the original one—that it must be sought at a level some 8 feet lower down—and that the apartment in its original state was some 18 feet high, and had been in modern times divided into two storeys, with a floor at the opening of the arched roof. In the eastern wall were to be seen traces of three lancet-shaped windows, which, investigation revealed, splayed inwards. An entrance from Meetinghouse Lane led into the lower portion of the building, which was divided longitudinally by a brick wall supporting heavy arching. It was evident that the rib-work of the beautiful groining sprang from wall shafts or corbels now found in the brickwork. Mr. Alexander's permission having been obtained to remove portions of the brickwork, the side and end corbels were disclosed almost as fresh as the first day, and carved in keeping with the ribs. A door on the south side in the west bay communicated with a dark and rudely vaulted passage about 10 feet wide, and running parallel with the building. This passage was evidently the slype, and served to identify the other buildings as the chapter-house of St. Mary's Abbey." Such is the account given by the investigators of one of the most curious and historic apartments in all Ireland. And with the addition of doorways at the rear of 25 and 26 Boot Lane, or, as it is now, Upper Arran Street, this dim and dust-covered apartment is now the only surviving portion of all the splendid buildings of the ancient abbey. The identification of this chapter-house gave at once the data from which the whole abbey could be conjectured. A small but beautifully carved Gothic window was discovered in the outer wall of the chapter-house, the existence of which, blocked up as it had been with subsequent overlays of bricks and mortar, was for centuries perhaps quite unsuspected. Mr. Thomas Drew, R.H.A., the architect of these investigations, assigned the date of this building to the years 1180 or 1200, a date which corresponded to the expressed opinion of Gilbert as to the date of the erection of the abbey. From a thorough knowledge of the characteristics of Cistercian architecture, and of the fact well known to antiquarians—namely, that all Cistercian abbeys were built on precisely similar plans since the eleventh century—Mr. Drew laid down on the Ordnance map of the locality a plan of a Cistercian abbey, which may be briefly set forth as follows :—Towards the south extended the fraternity or community-room of the monks, divided by pillars supporting their dormitory, with unglazed windows, which the austerity of the Cistercian rules enjoined. Across the end of Meetinghouse Lane was the kitchen, or as it was called, the calefactory ; to the west stood the refectory, on the space now known to us as "Mary's Abbey." Then came offices and stores, while at right angles to the line of the other buildings stood the "Domus Conversorum," or workroom of the lay brothers, with its dormitory overhead. This stood about the site of the Jewish Synagogue (which was by the way in former times the Bank of Ireland), and probably, says the account, extended from the front of that building back to the south wall of the abbey church, a fragment of which, with doors, sills and jambs, is still to be seen at the back of the houses in East Arran Street. The church formed the northern boundary of the cloister garth, and extended to the rear of Arran Street, through the premises which are now Messrs. Boland's bakery establishment, to a termination somewhere at the rear of Capel Street. The south transept of the church, with the sacristy, joined the chapter-house, and completed the quadrangle of the cloisters. Further excavations made in Messrs. Boland's premises confirmed this sketch. While digging in that portion where the choir, south transept and altar would have been, several small fragments of ancient tiles were found, while two built graves or small vaults were discovered, these being evidently the tombs of kings or bishops who were buried in the church at the foot of the altar. Many of the tiles are believed to date from the time of the Cistercian building. They are varied in style and character, some being incised with regular patterns, others ornamented with raised designs, letters, fleur-de-lys, &c., but all conventional in design,

while of the whole collection the best is an enamelled floor tile 1½ inches thick, found 12 feet under ground in Messrs. Boland's bakery in 1882, on which is a rude representation of the gable of a church, supposed, indeed, to be none other than the façade of the church of St. Mary's Abbey. Our account would be very incomplete did we omit to mention the scriptorium, or, as we would now say, the study or library. This room, which was larger than the chapter-room, extended both over the latter and the space over the slype. In these scriptoria the monks pursued those labours to which it has been well said "modern literature is indebted for the preservation of all we know of the classics of Greece and Rome, and even for the survival of those languages themselves." The scriptorium of St. Mary's is now a store, with nothing left to remind us of its ancient state, save perhaps the strength and thickness of the few fragments of the old walls which still remain intact, while we are told that within living memory it has been used as a theatre. We know, too, that other portions of the abbey were used as building material more than once by those into whose hands the monastic property fell. In 1676 the then Lord Mayor of Dublin, Humphrey Jervis by name, threw down a portion of the abbey in order to get building material for a bridge he was then constructing across the Liffey, and which was called Essex Bridge, after the then Viceroy, Arthur, Earl of Essex. A strange fate overtook the bridge for whose benefit the old walls of St. Mary's had been torn down. The builders of bridges do not seem to have been as perfect in their craft as the old monkish builders of monasteries, for only ten years after the erection of Essex Bridge the bridge itself collapsed completely, tumbled pell-mell into the river, carrying to a watery grave a coach and horses, which, unfortunately, happened to be traversing the bridge at the time. Within the abbey itself change and decay have long since swept away any traces of the internal ornaments or decorations of church or monastery. One object, and one only, of this nature is, so far as we know, at present in existence, and that is a life-size statue of the Virgin and Child, carved in Irish oak. Petrie, referring to this curious monument of past ages, says of it :—"The style of this is dry and Gothic, yet it has considerable merit, far too much, indeed, to allow us to suppose it a work of Irish art. We rather attribute it to some able carver of Albert Dürer's school, to whose time and style it unquestionably belongs, and we should not deem it very unlikely even to be an early work of that great master's own hand." Such was the statue, originally a distinguished ornament of St. Mary's Abbey, and not alone an object of beauty, but of deep religious veneration. In the abbey of St. Mary it stood therefore till that storm of iconoclasm which accompanied the Reformation burst over the land. One-half the statue was burnt, the other half was buried face downwards in a neighbouring innyard, where, with the hollow trunk appearing over ground, it was used as a hog-trough. Afterwards, however, it was restored to the little chapel of St. Mary's parish, which had grown up within the ruins of the monastery, where it remained many years. It may be added that an ancient silver crown adorned the Virgin's head, which crown was generally supposed to have been none other than that used in the coronation of Lambert Simnel in Christ Church Cathedral. Petrie says with regard to this :—"We incline to think this is erroneous. It was a double-arched crown, such as appears on the coins of Henry VII., and on his only—a circumstance which marked with exact precision the age of the statue which it had adorned." In the Carmelite Church, Whitefriar Street, standing on the side altar may now be seen this quaint and ancient relic of the once famous abbey. Beneath it is placed the following inscription :—"This ancient image of the Blessed Virgin with the infant Jesus in her arms formerly stood in the abbey church of St. Mary, near Capel Street, Dublin. It was mutilated and in a decayed state when purchased in the year 1824 by the Rev. John Spratt, Prior of the Calced Carmelite Convent, at whose expense it underwent a thorough repair."

We have now glanced briefly at the history of this famous abbey. There is, indeed, little more to tell. Till the year 1541 it was great, rich and prosperous. In that year it was suppressed by the statutes of Henry VIII. and his Parliament. Into the details of the suppression of this "very noble monastery," as one of its chronicles has it, we will not enter here ; suffice it to say, however, that its suppression and extinction was complete. For some years longer, Roman Catholic worship was conducted within its walls, and we read that in the year 1551 a public discussion was held in the "Great Hall of St. Mary's Abbey," under the sanction of the lord deputy, Sir James Crofts, between Staple, Bishop of Meath, and Primate Dowdal. The conference turned on the sacrifice of the Mass, and other matters arising out of the order of King Edward VI. to read the Liturgy in the mother tongue. Gradually, however, the buildings fell into decay. Yet strangely enough within the old site there was established in the reign of Charles II. the "Presbyterian Congregation of Mary's Abbey." The circumstances of the establishment of this branch of religious worship are not very easy to trace, but it appears to have been founded about 1667, and here this congregation remained till the winter of 1864, in which year they removed to a new and larger place of worship, and what was for many years the old Presbyterian church is now a bakery.

Our tale is told. Those who care for the relics of the past may even at this day, if they have any wish to visit all that is left of a great Mediæval monastery, stand within the old chapter-room of St. Mary's Abbey, and, gazing round amid the gloom and dust, see the dark walls and vaulted roof of the historic room which some historians tell us was once a king's council chamber. They may try, too, to conjure up before the eye of imagination that memorable scene, of which the author of "The Hibernian Nights' Entertainments" has given us a dramatic sketch, when, in this selfsame council chamber, the heir of the Geraldines, better known by his sobriquet of "Silken Thomas," came down to denounce the supposed treachery of the English king before that king's own council, and in the midst of peers and prelates tore off the silken robes of office (worn as the representative of his father, the then deputy), and flung the sword of state upon the council table with a violence so great that the blade started a hand's-breadth out of its scabbard. While "stripped thus of his ensigns of dignity, Lord Thomas Fitzgerald stood up, amid the wreck of his fair fortune, an armed and avowed rebel, equipped in complete mail, before the representatives of England and Ireland."

STEEL FOUNDATIONS.*

THE prairie soil underlying the city of Chicago is unfavourable to the construction of heavy foundations. The character of the strata changes materially in short distances. In general, however, there are 6 to 12 feet of loam and quicksand, then a layer of clay, which is hard and firm in some places, but in others so soft and wet that it may be readily taken out with a spade. In the business section of the city, where all the great business blocks are located, the clay, often mixed with strata of quicksand, reaches down from 40 to 80 feet to a limestone foundation. Generally a few feet down the clay grows softer and wetter. If any of it becomes solid and hard, or there are any hard-pan layers within the reach of ordinary piles, there seems to be no indication that they are uniform or at all to be relied upon. Until recently heavy foundations were commonly built of stone and concrete resting on the clay. In later years, however, this method has not given satisfactory results. The demand for all the space in the basements of great buildings has yearly grown more urgent. Either the bed of the foundations must be lowered, the foundation itself must be made thinner, or some entirely different method must be employed. The first of these alternatives has been very generally ruled out, because it has been demonstrated very clearly that the less the clay stratum is broken, the more uniform and satisfactory is the settlement of the building. Other methods have been tried repeatedly, piles have been driven, and sometimes timberwork has been combined with masonry and concrete, but the results thus obtained have also been generally unsatisfactory. As an example, the Cook County Court-house, which was built on piles, is reported to have settled over a foot and very unevenly. There are still some, however, who advocate their use. If the piles could be driven deep enough to rest upon some hard bottom, they might give us a permanent, unyielding foundation, but, judging by results so far obtained, the method is not nearly as reliable as the direct clay-bearing.

The drift of practice has been to make the foundation thinner with the use of iron, spreading out on the top of the clay without materially breaking it. At first it was only in a half-hearted way. Many old rails were used, and they were sometimes laid very unscientifically. But the practice has steadily improved. New rolled rails and heavy beams are now employed, and they are as carefully calculated for their work as any other iron in a building. This evolution has produced an entirely new type of foundations—a substitute for heavy masonry and huge blocks of concrete. Let us see how fully it has met the problem.

The site of the building now being constructed by the Women's Christian Temperance Union was previously intended for another structure, all the foundations of which were put in place some years ago. These were made of great piles of masonry, one for each column, all underlaid with a bed of concrete resting on the clay stratum about 10 feet below the street grade. This great quantity of stone so cut up the space below the street level that nothing was left available for basement use. There are now acres of buildings in the very heart of Chicago without any basement, and on this very account. In this case all the masonry has been removed, and new steel foundations have been placed on the old bed of concrete so well designed that all the basement space is available. This is the great dif-

* From a paper by Mr. Congdon T. Purdy, C.E., in the *Engineering News*.

ference between the two methods which every one first notices, and which, of course, tells most from the financial standpoint.

In the time required for building, the iron foundation has a great advantage, at least in Chicago. If rails are used the rails can be placed on the ground in two or three days, and when all the material is at hand and excavations completed, the whole foundation can be put in place in a few hours. This is oftentimes a very great advantage, and alone a sufficient consideration for the employment of this type of foundation. The cost of iron foundations varies exceedingly, depending principally upon prices of material, the ingenuity of the engineer and the familiarity of the workmen with that sort of work. In general, the cost of stone foundations will figure somewhat under that of iron, but compared with the cost of foundation per square foot of renting area, which is the proper way of doing, this difference will be eliminated.

It often occurs that heavy column loads come close to some old building or to another man's lot, so that it is impossible to spread out alike on every side. In such a case as this, the area between this and some other column can be spanned with steel beams, making a compound foundation and utilising an area that could not be used at all with masonry. Oftentimes in this way a foundation is made with two loads—one on each extreme end.

The clay loads most generally used through the business centre of Chicago vary from 1½ to 2 tons per square foot, the tendency being for the former rather than the latter. With this load the structure will settle from 3 to 5 inches, and this is usually provided for by reckoning everything that much too high at the start. Settlement comes slowly, but none the less surely. It comes in proportion to dead loads, and is dependent in some measure upon the perimeters. The whole subject presents a most interesting field for study, and one in which there is much to be learned. The judgment of practical builders who have the best opportunity for observation confirms the theory that clay areas should be proportioned to dead loads only. Where live loads are figured into clay loads for interior columns and exterior walls, the walls invariably settle the most. The reason will be found in the fact that the live load is a greater per cent. on the whole load on the columns than it is of the load on the walls. The difference in length of perimeter for wall and column foundations must also have some effect, and a similar one. In most buildings it is desirable to count a fraction of the live load in the total load on the columns, and consistency requires that whatever load is placed on a basement column should also be put on all the iron under the basement column. On this account it happens that while the area on the clay is calculated for dead load only, the beams in the foundation must sometimes be calculated for some live loads, and iron loads and clay loads must be kept separate and distinct. In general, the centre of gravity of the load should coincide with the centre of gravity of the clay area covered. In compound foundations this sometimes becomes complicated.

The concrete used is made of the best Portland cement, usually one part with four parts of crushed stone and two parts of coarse sand. Steel rails weighing 75 lb. per yard are mostly used where beams are not required. Seconds are found to answer quite as well as the first quality, and the chances are that for the length required they will be quite as good as the best, and if any flaw does exist the chances are few that it will come where the maximum bending moment occurs. In ordinary foundations they are more economical than beams. More iron is required, but the rails can be bought for about one-half what the beams cost, thus more than covering the difference in weight. It is easier to place the concrete when rails are employed, and the webs are always thick, two other good points in favour of the rail. If heavy loads must be carried with a few pieces, as is often the case in the top course immediately under the column, heavy beams are a necessity. This is also often the case where long spans are required. The sizes generally used are 10, 12, 15 and 20-inch. There is no advantage in having the iron in direct compression, and only that part projecting is strained to its usefulness as a beam. Therefore it follows that the place for beams is at the top of the pile, and that the larger the proportion of iron uncovered the greater the economy of the structure.

In designing foundations the engineer first decides on the general arrangement to be used, the sections to be generally employed, unit strains, &c., all of which is dependent in a great measure upon his judgment and experience. This done, each foundation is treated on its own merits and each course of iron is separately calculated. In putting these foundations into position, the workmen first make a plank frame the same size as the concrete bed and place it carefully into position, making the top of it, with the use of a Y level, the exact height which the top of the concrete is expected to be. After this is filled another frame is arranged for the next course, and so on to the end. The rails for each course are spaced equally. The concrete is carefully tamped between, completely embedding the iron, and as soon as one course is completed the next one can be begun. After all this is done the boxes are taken away and the whole is carefully plastered with Portland cement mortar, so that at no place is the iron exposed. It seems as if these steel foundations might be used in other places, where bed rock cannot be had to rest loads upon and where real estate is very valuable, though perhaps it would be difficult to find another place where they so perfectly fit the need as in Chicago. They are peculiarly well adapted to compound foundations where the position of loads with reference to each other is bad, and the areas which the foundations can cover are limited. This need is very liable to occur in any large building—a tower between walls, a heavy chimney stack, or a badly-arranged cluster of columns where it is almost impossible at best to distribute the loads so that they shall bear evenly upon the soil. In such places, if the load is not distributed, there will come an unequal settlement, and the bane of foundations is not that they settle, but that they settle unequally. Oftentimes in the arrangement of machinery it becomes necessary to build great pits almost adjacent to the bearing of heavy loads, and where the cutting of the masonry almost destroys the proper distribution of the load over the area expected to carry it. Here again the use of beams in conjunction with the masonry may be to the great advantage of the structure. Indeed, wherever the proper distribution of loads becomes difficult, iron may be made a valuable adjunct to the masonry.

The question of the durability of iron embedded in concrete can only be definitely answered by time itself. So far wherever iron has been taken out it has been found well preserved. Chicago architects and builders are showing their faith in it by constant use, though wiseacres still shake their heads and prophesy that some day the rail will become a streak of yielding sand.

A JAPANESE ARTIST.

THE last mail from Japan brings news of the death, at the age of eighty-three, of Shibata Zeshin, the greatest worker in Japanese lacquer that ever lived. From an account of his career given in the *Japan Mail* of Yokohama, it appears that the first of his works to attract attention was painted between 1844 and 1848. It was presented as a votive tablet to the shrine of Inari, in Oji, a village in the suburbs of Tokio, where it still hangs. Shortly afterwards it was seen by a member of the great Matsudaira family, who offered a large sum for it, but the priests did not consider they would be justified in parting with it. Zeshin, as he was generally called, commenced his artistic career at the age of eighteen or nineteen as a painter of fans, and even while pursuing this humble calling his work was of such excellence that the sons of artistic families became his pupils, and many of them gained high reputations afterwards. It is said of Zeshin that when his pupils complained of business being slack he told them they ought to congratulate themselves, for it was only when the pressure of everyday employment was removed that men could undertake works calculated to establish their reputation. He worked up to five days before his death, and was engaged upon a decorative picture painted on silk of the Japanese Elysian fields, which was almost completed. Examples of his great works in lacquer decoration have been exhibited in Europe, and have given him a position amongst the greatest industrial artists of his country. It is curious to note that the four greatest artists of modern Japan have died within the last four years.

THE ULPHIC OLIPHANTE IN YORK MINSTER.

AMONG the abounding antiquities of the city of York the treasured object known as the Horn of Ulphus might be cited, says Mr. Oliver, as one of the most conspicuous, and one which was prolific of interest to visitors to the cathedral, both from the circumstances in which it came into the possession of the Chapter, and because of its extrinsic value as a relic of a custom of the tenure of land, which was probably of the highest antiquity. The drinking-horn proper, made from the horn of the wild ox, of which the "olifant" was most associated with luxury, was confined, said Pliny, to the barbarous nations of the North, and the statement was confirmed by what they knew of its use by the Scandinavian, High German, and Saxon branches of the Teutonic race, and its discovery in the sepulchral tumuli of the Anglo-Saxons. The story of the Ulphic horn was as follows:—Ulphus, the son of Thorold, was an influential thegn that was "servant" of the king, of Danish origin. He ruled as consul with the title of earl over the western part of Deira, a division of the kingdom of Northumberland, bounded on the north by the Tyne and on the south by the Humber. That prince, of whom little or nothing else was known, was, however, not without honour in his father Thorald's adopted country for the dignity of "Eorle" which he enjoyed, and it was at that time that the Danish title of earl was first generally used, and

was of the same rank as that of archbishop. To confirm the investiture, Ulphus gave to the church as a pledge of his good faith an important and valuable personal requisite in the form of his own drinking-horn of carved ivory, from which he previously drank wine upon his knees before the altar. The olifant, when thus presented, was carved with verrols of gold, and had a gold chain for suspension. It was, however, stripped of that embellishment by a goldsmith to whom it was sold in the reign of Edward VI., and it afterwards came into the possession of the Fairfax family, by whom, in the person of Henry Lord Fairfax, it was returned to the cathedral.

ROMAN REMAINS IN CHESTER.

THE party who are engaged exploring Chester city walls in search of Roman remains have discovered a stone to the memory of a veteran Roman soldier, who appears to have put in his full time of service; and another inscription, so far as can be deciphered, refers to the death of a soldier of the 2nd Legion of the Roman army of occupation. The latter possesses peculiar historic interest, inasmuch as the general belief hitherto has been that it was the 20th Legion which occupied the city. The inscription on one of the memorial-stones found in the earlier part of the week is—

D. M.
CVRATIA. DINY
SIA. VIX. AN. XXXX
H.F.C.

Some archæological experts have translated this, "To the divine shades, Curatia, who lived forty years. Her heir erected this to her memory." Above the inscription is a very perfect piece of sculpture showing a recumbent figure on a couch, with a tripod table near. Two doves stand on wreaths in the alcove, and in the ornamental border there are water nymphs trumpeting. The nymphs are curiously composed, each having a human head and body, four horses' legs and a fish-tail. The figure, believed to be that of a woman, holds a scroll in its hand.

THE OLD MANOR-HOUSE, ASTON BURY.

THE old manor-house known as Aston Bury is about three-quarters of a mile south-east of the church and village, which are near the road to London passing through Hatfield, and was probably built by one of the Botelers about the middle of the sixteenth century, but which one is uncertain. The plan on the north side forms a straight line, but on the south is broken by two projections, which are filled with remarkably bold but fine staircases with Renaissance details; they are both much of the same design, but the one in the eastern wing is the richer. Leading to it on the ground-floor out of the old hall is the principal doorway, with a Tudor-headed arch, in the spandrels of which are carved two shields of arms, which help to give a date to the building; on the east side are the arms of the Botelers. Sir Philip Boteler, of Woodhall, married Elizabeth, daughter of Sir Robert Drury, knight, of Halstead, Suffolk; he acquired the estates in 1540, and died on March 28, 1545, and it was in all probability by him that Aston Bury was erected. Most of the rooms, as was usual at this time of domestic planning, are thoroughfare rooms. The most peculiar feature in the house is the long-room, which is reached by the eastern staircase; it runs the whole length of the building on the north side, it is 110 feet long internally, 17 feet 6 inches wide, and 8 feet 4 inches from floor to top of the moulded wall-plate cornice. The roof is waggon-shaped and ceiled. It is lighted by a large square-headed window at east and west ends, and by four smaller ones on north side in the gables; there are eleven small cupboards formed in the roof, which seem to have been originally all boarded. It was entered by two large doorways in the south side, and warmed by two open fireplaces in south wall. It is the opinion among some of the inhabitants that Aston Bury was once a nunnery, and this room was their living apartment, and that the eleven small cupboards was where they slept. It is much more probable that the room was intended for a ballroom. Several stone coffins have been found at different times near the house. There was formerly a chapel at the east end of the building, the foundations of which were removed not many years ago. The building externally is most picturesque, especially the north front, the monotony being broken by the four moulded brick gables and string-course. The moulded brick chimney-stacks here are most beautiful in detail, most of them varying in design.

There is a picture in the British Museum of Aston Bury drawn about the year 1805. In this drawing the porch is placed in the exact centre of the house, and is of brick, the top of the porch corresponding with the gables of the house. The present front door was formerly a window, and no doubt was altered when the house was turned into a farmhouse, for the porch is of wood, and perhaps made of part of the oak screen which used to run across the old hall. In the beams and floors of the new kitchen, formerly the old hall, are marks of where the screen was attached to the old beams.

THE LATE WILLIAM THEED.

THE death is announced of Mr. William Theed, the well-known sculptor. He had attained the age of eighty-seven, having been born in 1804. His father was also a sculptor. Young Theed received his general education at Ealing, and for some years was a pupil of E. H. Baily, R.A. At the age of twenty-two he began a course of study at Rome under Thorwaldsen, John Gibson, Wyatt and Tenerani. Notwithstanding an ardent devotion to his profession, he did not acquire a high reputation until 1844. In that year the Prince Consort requested Gibson to send him designs by English artists in Rome for ten marble statues to be placed at Osborne. Theed took part in the competition with *Narcissus at the Fountain* and *Psyche lamenting the loss of Cupid*, both of which were adopted. To the same period belong his *Ruth Gleaning*, *The Prodigal's Return* and *Rebecca at the Well*. In 1848 he returned to London, where his work had already begun to attract attention. On the death of the Prince Consort, Mr. Theed was asked by the Queen to execute a life-sized group of herself and His Royal Highness in Early English dress, *The Parting*. After this, as may be supposed, he had no reason to complain of a deficiency of commissions. His most important achievements were the statues of the *Prince Consort* for Coburg and Balmoral, *Musidora* for Marlborough House, *Sir Isaac Newton* for Grantham, *The Duchess of Kent* for Frogmore, *Henry Hallam* for St. Paul's Cathedral, *The late Lord Derby* for Liverpool and *Sir Robert Peel* for Huddersfield. He also designed the twelve bronze alto-reliefs from English history in the Prince's Chamber, House of Lords, and the colossal group representing Africa on the Albert Memorial in Hyde Park.

RICHARD MOON SCHOLARSHIPS.

THE conditions of the scholarships instituted by Sir Richard Moon, Bart., late chairman of the London and North-Western Railway Company, to mark his connection with that company, have been issued in connection with the educational prize scheme of the Mechanics' Institute, Crew. The market value of the debenture stock which Sir Richard has transferred to the Council of University College is about 2,600*l.*, and in accordance with the terms of the trust the proceeds of the fund are to be used for scholarships, exhibitions or prizes to be awarded to young men employed in the London and North-Western Railway Company's works at Crewe, Wolverton and Earlstown, who are desirous of pursuing the study and practice of engineering. The fund will be known as the Richard Moon Scholarship Fund, and for the present will be applied to the creation of two scholarships, each of the value of 40*l.* a year, and tenable for two years. One scholarship will be offered for competition in the course of the summer term of each session. Candidates for these scholarships must not be less than sixteen and not more than twenty-three years of age on the day appointed for the commencement of the examination. Every candidate must have been employed at one of the approved works of the London and North-Western Railway for at least twelve calendar months continuously before the date of commencement of the examination. Candidates will be examined in mathematics, physics and engineering. Every Richard Moon scholar will be required to employ himself wholly in the prosecution of his studies at University College, Liverpool, or with the approval of the college senate in some manufacturing workshop or institution in such a way as will conduce to his advancement in the science or practice of engineering.

Correspondence

Increase of Lunacy and Costly Asylums.

SIR,—It appears from the most recent returns that during the year 1890 the percentage of lunatics discharged as cured was 38·59, and less than the rate for the previous year, therefore the main purpose of asylums for the insane continues to be the permanent safe custody and treatment of the incurable. During the past thirty years the number of registered lunatics has nearly doubled in proportion to the population, the increase being partly attributable to the withdrawal of patients from

workhouses, the inclusion of persons who would not have been formally regarded as insane a few years ago, and to causes of a kindred nature. It must therefore be noted that, as a greater proportion of cases are less acute than in years past, statistics as to cures cannot be advanced in support of great advantages derived from modern systems of custody and treatment. The importance of reducing the cost per bed in the erection of the asylums will not be over-estimated, if it be remembered that for the county of London alone additional asylums for more than 2,000 patients must be provided every five years to keep pace with the continual increase of the insane; therefore, with regard to this county particularly, it is most desirable that there should be a careful consideration and comparison of new asylums, and of the cost of working these as well upon old as upon new and untried methods, prior to the erection of others upon similar models.

The total cost of land, buildings and fittings, as well as the cost of maintenance, during a sufficient term of trial should be accurately ascertained, and the results made more public than hitherto. New systems of heating, ventilation, lighting and other matters, should be tested as well with regard to their suitability for small as for large institutions. The proportion of cures to the whole number of patients should be ascertained with, if possible, greater exactitude, that none, partly cured, return to propagate their calamity to future generations; but it is to be feared that for the sake of a comparatively small percentage of curable cases, that a very large proportion of known incurable, insane paupers are housed at an outlay, *per patient*, that would provide a very comfortable residence for a well-to-do working-man and his family. In *The Hospital* for September 5, a writer (referring to an assertion in a previous issue) asks, "If an asylum can be built for 130*l.* per bed, I, as a London ratepayer, would like to ask why the Council is expending upon its new asylum at Claybury 200*l.* per bed? I understand this asylum is to contain 2,000 beds, and that more than 400,000*l.* is being laid out."

Probably more has been done, and is being attempted, for the housing and treatment of pauper lunatics of the incurable class than the community can afford, having due regard to its numerous other responsibilities; enormous sums have been, and are being, expended upon asylum buildings, but with regard to cost probably no scheme of modern times has been more disappointing than that for the Claybury Asylum, for which the original estimate was 290,000*l.*, or 143*l.* per bed, but which is more likely to cost nearly twice as much, although (to quote a published description of the work) "the original design is, in respect of its general arrangement and accommodation, almost identical" with the works as carried out, but the question has elsewhere been raised as to why it should be necessary to expend so much upon this asylum, and so very much less per patient at the asylum, near Dorchester, which is in the same architect's hands.

There have been recently distributed amongst those interested in the promotion of the building of asylums copies of a paper upon the subject. The writer, an architect, states as follows:—"A word in passing about competitions, which are unfortunately gaining ground. I say unfortunately, because they are not always calculated to produce the best results." Now I am strongly of opinion that it would be a subject for regret if asylum-planning should be limited to the few, and the fair competition of architects upon such works discouraged, for the community are greatly in need of all the ability and invention that modern architects can bring to bear upon the subject, and there are not only a number of architects who have really a large experience of such undertakings, but also many architects' assistants who, having been specially trained in asylum works, are awaiting their chance for a commission.

One of the costly items of asylum construction is the system of heating and ventilation; in very large buildings an enormous extent of expensive excavations for underground air passages is provided for. This I consider to be very undesirable, first, upon the ground of expense, and again by reason of loss of power and heat (by absorption, friction and other causes *en route*), especially when mechanical means are adopted to drive heated air in directions opposite to its natural course. This loss must often be serious and involve an increased outlay to maintain heat and a supply of fresh air, particularly when (upon a large scale) the attempt is made to supply an adequate amount of warmed air from the ceiling levels; apart from this these underground passages are receptacles for dust, are dark, and there is the chance of extracting here and there foul air from stagnant corners out of sight, for in very large buildings it would appear to be impossible, even after the finest supervision of the works during progress, to avoid this risk.

Asylums have been erected within the last few years not only at a cost of 130*l.* per patient, but for very much less, and in my opinion it is improbable that this figure will in future years be very much exceeded, for statistics already show that a greater expenditure is undesirable and uncalled for.—Yours faithfully,

"SUUM CUIQUE."

September 15, 1891.

The Collapse of a New York Building.

SIR,—I enclose you a cutting from one of the New York papers, which might be considered worthy of a corner in your paper:—

The Building Inspector's Plea.

You'd scarce expect one of my kind
A great big building's faults to find,
For I'm not only an inspector—
I am a worker and elector!

'Tis true I have the use of eyes
And that I ought to supervise
The use of buildings, too; but then
I am no worse than other men!

I see about me day by day
Officials who still draw their pay
Because their names are on the list,
And who I'm sure would not be missed!

How should I know how girders lie
And tenants pile dead weight on high?
People who gird at me should try
If there's no beam in their own eye!

I can't see through brick walls, and so,
As strolling down the street I go,
I take for granted things are right
Mainly because they're "out of sight."

The inspector is not the only person who deserves blame. More responsibility attaches to some of the owners and tenants, for the architect of the fallen building in Park Place declares that the structure was designed as an office building. That being so, why did the owners lease any of it for manufacturing work which required heavy machinery, like steam printing-presses, and why did the lessees select it? Both parties knew that the building had no interior walls to stand the strain which great masses of machinery and material imposed.—Yours obediently,

C. P. S.

GENERAL.

An Exhibition of the products of Ancient and Modern Cyprus will be held next year in London. It is to comprise art and antiquities as well as industrial products.

The Comte de Paris has presented to a Canadian church a relief in silver representing St. Louis offering his sceptre to St. Anne. It was specially produced in Paris.

The Local Government Board have sanctioned a loan of 14,000*l.* for the erection of public baths in Coventry, and a loan of 1,375*l.*, the purchase money of property in Earl Street required for the site of the proposed new municipal buildings.

Sir Augustus Harris has again adopted Wenham lamps for lighting Covent Garden Theatre during the present Promenade Concerts season.

Mr. George Reed, the new president of the Royal Scottish Academy, has prepared designs for the decoration of Craigiebucklar Church, which will be carried out under his direction and at his expense.

Mr. Colin Rae Brown has presented to the Mitchell Library, Glasgow, the early records, scroll minute-book and letter-book in connection with the National Wallace Monument enterprise which he organised in Glasgow thirty-five years ago.

St. Peter's Church, Vere Street, W., has been reopened, after having been closed for a short time, to allow of a new scheme of ventilation being adopted, and the work has been successfully carried out by the "Climax" Ventilating Co., of 15 Great George Street, Westminster.

The Goole Market Hall Company, says the *Leeds Mercury*, have declined the offer of 4,000*l.* made by the Goole Local Board for the site upon which the late Market Hall (destroyed by fire) was erected. They have expressed their willingness, however, to accept 4,500*l.*

The Primitive Methodists of Bradford have resolved to pull down Mansfield Road Chapel, built in 1824, and build a central hall. The ground-floor will consist of shops, with a large vestibule and staircase; above will be the principal hall, constructed in the form of the Mechanics' Institute in the town, with sitting accommodation for 600. The entire outlay will be 3,000*l.*

The New Schools, Kingston, S.W., are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

We have just received an advance copy of the twelfth edition of "Successful Advertising." The book has a very useful list of newspapers and gives many hints on success in advertising. It is published at 2*s.* by Messrs. Smith & Osborne, of 132 Fleet Street, E.C.

A School of Fan-painting will be opened next month under the patronage of the Company of Fanmakers.

The Architect.

THE WEEK.

ONLY thirteen sets of drawings have been received in the competition for the Cork Court-house. Each set consists of nine drawings, viz. :—A plan of the basement showing the cells for prisoners, and the method of heating the building ; a plan of the principal floor showing the arrangement of offices and seats in court ; a plan of the first floor and offices, four elevations (viz. to Great George's Street, Cross Street, Court-house Street and Liberty Street), a cross section and a longitudinal section. All these are on a scale of 8 feet to an inch. A descriptive report with detailed estimate accompanies each set, showing how the probable cost is made out. The conditions have fixed the cost of the work at a maximum, 20,000*l.*, but the committee have intimated that they expected it to be done within 15,000*l.* The portico and façade from Cross Street to Court-house Street, which were little injured in the fire, are to be retained. The remaining exterior parts are subject to such alterations as may be found necessary to meet the altered arrangement of the interior. It is expected that the competitors will not only produce a design for a more comfortable edifice than the old one, but will be able also to make provision for considerable additions to the accommodation of judges, jurors, officials and the public, having regard to the extended jurisdictions and functions of the local tribunals and officers. Mr. THOMAS DREW, R.H.A., is the assessor who will aid the Corporation Committee and the Court-house Commissioners in the selection of the plans. The premiums are 100*l.*, 60*l.* and 40*l.* Unfortunately the awards are subject to the approval of the Municipal Council of Cork, and no doubt it was apprehension of the consequences of dealing with so uncertain a body which prevented a greater number of architects from taking part in the competition.

THE arrangements for the competitions in connection with the Dundee Institute of Architects have been completed. Prizes are offered for the best architectural sketch, any subject or part of a subject ; the best architectural measured drawing or drawings, containing plan, elevation and section to $\frac{1}{8}$-inch scale ; the best etching on metal of any subject of an architectural character ; the best series of not fewer than four photographs of any architectural or engineering subjects ; the best modelled or carved original design of an architectural or decorative subject in any material ; the best sketch in any medium from an antique subject in the Dundee Art Museum of casts ; the best architectural or engineering drawing. The candidates must belong to Forfar, Perth or Fife. The works are to be sent in on or before May 1, 1892. For the ensuing session the committee have been able to arrange with lecturers of ability, and it is evident the institute becomes more attractive to the members as it grows older.

THE district surveyors are anticipating a busy season through the provisions of the London Sky-signs Act. By that measure it is enacted that any person having any "word, letter, model, sign, device or representation in the nature of an advertisement, announcement, or direction," "supported on or attached to any post, pole, standard, framework or other support, wholly or in part, over any house, building or structure which, or any part of which, shall be visible against the sky from any point in any street or public way, with the exception of any flagstaff or pole or any vane or weathercock not adapted or used for advertisement," and with the exception of "any sign which is securely fixed to or against, but not over, any building, or which rests immediately upon the top of any wall or building," shall be compelled to remove such sign under heavy penalties, unless, on or before October 3, 1891, he applies in writing to the district surveyor for a survey and inspection of such sign and a certificate of its safety. The surveyor cannot grant a certificate unless the application be made to him within three months after the passing of the Act, and no sign can be allowed to remain without such certificate has been obtained. A district surveyor, who writes to the *Times* on the subject, affirms that all signboards of public-houses and other places of business which rest upon a cornice in front of a parapet or blocking course will fall within this category, as they do not rest immediately upon the top of any wall or building, the top of the building being the highest part of the roof, and the cornice being a projection from the wall. It will be the duty of the district surveyor to report to the Council from time to time all such signs existing in his district. The County Council will be bound to prosecute any offender against the Act, and no cautionary notice is due to any one. It was understood that the Bill, when introduced, was directed solely against sky-signs and any other class of announcement that was not according to established precedents. But apparently the enactment is more comprehensive, and it is destined to give many an unpleasant surprise to London shopkeepers before the year is over.

THE members of the Surrey Archæological Society will have an afternoon excursion to Ham House, Petersham, on Saturday, October 3. Lord DYSART has given permission for an examination of the house, which was built early in the seventeenth century. Practically it remains unchanged, and is filled with art treasures. Mr. S. W. KERSHAW, F.S.A., has prepared a paper on the history of the house, which will be read at 3 P.M. punctually, after which the party will walk through the principal rooms and inspect the pictures, &c. Ham House is about 1½ miles from Richmond Station.

THE project for the proposed cathedral of St. John the Divine is not to rest in abeyance, although the long excitement of the competition is over. According to *Architecture and Building*, the trustees will, before the end of the present autumn, inform the architects, Messrs. HEINS & LA FARGE, as to what modifications are desired, so that during the year 1892 the corner-stone may be laid. As soon as the arrangements with the architects have been completed, copies of the cathedral designs will be made and used, in connection with other methods, for the purpose of obtaining subscriptions, it not having been thought wise to make any attempt in this direction until the trustees should be able to inform the public definitely as to the plans of the cathedral. The gifts thus far made—either actually received or legacies soon to be paid—have been made without solicitation, and amount substantially to about enough to pay for the site, that is, 850,000 dols. In Great Britain churches have been commenced under similar circumstances; but, from the prominence of the new building, it will not answer to have the works suspended after they are once commenced.

THE exhibition which will be held in Boston during the convention of the American Institute of Architects in October will include all kinds of architectural drawings, sketches, plans, details, decorations, drawings of furniture, interiors, &c., as well as photographs of executed work, though it is stated to be quite desirable that the photographs should be accompanied by sketch plans as far as possible. As the exhibition will appeal primarily to the architects as a professional body, the committee hope that the contributions will by preference be largely such as will illustrate the actual office work and study of the architect, not, however, to the exclusion of purely artistic rendering or picturesque sketches. In order to be properly exhibited all contributions should be framed or mounted on stretchers. No exhibition blanks are necessary, but each drawing should bear the name and address of the exhibitor on the back. When the draughtsman and the exhibitor are not the same, it is desirable that the draughtsman's name should appear on the front of the drawing. The committee have arranged with firms in various cities of the United States to act as agents, and receive, pack, forward and return in proper order all contributions for the exhibition, without expense to contributors. An illustrated catalogue of the exhibition will be published. The expenses will be shared by the Boston Society of Architects and the Boston Architectural Club.

FRENCH VIEWS OF ENGLISH GOTHIC.*

THE article on "Gothique Anglaise," by M. PLANAT, indicates none of that feeling of self-satisfied superiority which too often inspires foreigners whenever they attempt to treat English work. We have already, when referring to his articles on Mediæval building in France, explained M. PLANAT'S point of view. As an authority on all problems in construction, he always renders full justice to any example of skilful contrivance which was produced by one of the Goths, and he is not indifferent to the impressive effects which are due to the beauty of many French churches and cathedrals. But he is not captivated by the style. As becomes a French writer, he follows the great classic authors of his country, and, with a few exceptions, they were never enamoured by anything that was Mediæval. The features which give character to the style were considered to be so many "colifichets" or trumpery trifles, and were utilised by professors of rhetoric as manifest warnings of the depths to which imagination can fall when allured by bad taste. You have only to change the names, said FENELON, and substitute poets and orators for architects, in order to see the consequences of departure from imitation of right models.

The literary influence of CHATEAUBRIAND and HUGO, aided by the more disciplined skill of MÉRIMÉE and VITET, created an interest in Mediæval work in France as well as a new Government department to look after the remains. There can be no doubt that they were able to gain support by pointing to England. Most Frenchmen are puzzled when they see so many Mediæval buildings in England well preserved, especially when they discover that Government is not directly concerned in the conservation. M. VITET drew a comparison between the fate of two Benedictine monasteries in England and France, in order to demonstrate how, in spite of reformations and revolutions, such buildings were respected in England, while in France the inmates did not wait for political convulsions to change the character of an ancient building. He went so far as to say that the celebrity of the English cathedrals, which assuredly was greater than that of the French buildings, was due to their marvellous preservation. On that account M. VITET implored his countrymen to lose no time in saving their architectural monuments from ruin. But he was too true a Frenchman not to believe that, in spite of their ruined condition, the French buildings were more valuable as works of art. All the English buildings of any period seemed to him to be cast in the same mould, whilst in France there were, he said, peculiarities of style in Alsace, Saintonge, Auvergne, Poitou, Languedoc and Rousillon. In fact, M. VITET saw a relation between the people of England and their ancient architecture; both were polished, varnished, shining with propriety and good keeping. As happened in other cases, M. VITET made use of English work to serve his own ends; but, however useful it might be, he was not entirely free from contempt for it in his judgments.

If a gentleman who was a genuine archæologist, and possessed an official interest in all things Mediæval, could allow himself to be led away by the national vanity, many allowances should be made for those who have a professional interest in a different style whenever they discuss the character of English Gothic. M. PLANAT does not need them. Naturally he admires Norman work, and some examples of the Transition. In Malmesbury he sees either the employment in a coarse way of elements which elsewhere were used with more elegance, or the first attempts of precursors who were in advance of their rivals on the Continent. The question is not to be solved in the absence of documentary evidence, but M. PLANAT does at least hold that the Malmesbury arches, however imperfect, may have been a lucky hit by some English worthy. Canterbury is associated with the name of WILLIAM of Sens, whose disciple was WILLIAM the Englishman. Some French scholars have concluded from the circumstance that Gothic must have been an importation into England from the Ile-de-France. M. PLANAT is opposed to that theory. He compares plans of the cathedrals of Canterbury and Sens, and while admitting some analogy between the "ronds-points" of the two, he says there is undoubtedly no resemblance between them in the greater part of the work. The strange trapezoidal form of the choir has no prototype at Sens. M. PLANAT'S theory of the part taken by French and Norman architects is reasonable. There is no doubt the Normans introduced Romanesque with their own modifications into England, and probably the architects and builders formed the party in advance; but here, no less than in Normandy, the evolution of the style went on. If in France some new feature was employed—and the domain royal has been credited with the invention of them—it was likely to be emulated by the Normans wherever they were to be found. When the great work of reconstruction at Canterbury was proclaimed in the twelfth century, general interest would be excited, and the aid of artists from all parts could be anticipated. The Gatehouse at Norwich, known as St. Ethelbert's, is one of the buildings which delight M. PLANAT. He says it is "un bijou d'art Gothique," and the introduction of flintwork is particularly happy. But the upper part, where the flint appears, is of later date than the remainder of the work. In Salisbury, with the purest details there is much—the arrangement of the windows being one feature—which is not to be found in Continental churches, and the plan is also English. Peterborough must too be considered as only remotely related to any French cathedral.

M. PLANAT selects characteristic types of various periods, and his countrymen must admit, on seeing the illustrations, that the Mediæval buildings of England are not copied with fidelity from French buildings. We cannot expect M. PLANAT to declare that the English buildings are the more impressive or the details more refined than those produced by French masons. It is enough to have it admitted that in England there was competence to treat the Gothic styles in ways that were not always irrational. M. PLANAT points out many features that appear to be excellent, and his interest in construction attracts him to arrangements in vaulting which are not to be seen in France.

His mode of treatment as well as his conclusions differ from those of M. VITET'S. In one case construction is taken as a guide, in the other what passes for history. M. VITET, although a Mediævalist, was, like the professors of literature, a believer in a standard or type that was to be accepted universally. English architecture was at first, he said, conformable to the universal type, "Type suprême et canonique." By degrees it lost fidelity, then became independent, and finally the land was overspread with a darkness in which all art was obscured. Under the Normans, he tells us, not only architects and workmen were imported, but stones ready dressed. Invaders carried, as it were, their cathedrals all built, just as in a subsequent age LE NOTRE planted forest trees on the terraces of Marly. In France the Romanesque style was not superseded without a long struggle; but the English, being imitators, seized on the "premier style Gothique" in its complete form. They carried it out successfully with one exception, viz. the substitution of right lines for curved in the chancels. One asks in vain, says M. VITET, by what reason the English were led to this schism. The change was not made necessary by any difference in the rites or canonical prescription, and it has not produced finer perspectives than the apsed end. M. VITET admits, however, that some of the English cathedrals have a noble expression, and Salisbury he considers to be magnificent. The fairies of the Alhambra have not, he says, surpassed the delicate groining that is seen in the chapter-house of Salisbury, and there is nothing like it in France. He admits that in vaulting the English were the foremost masters, and to the accomplishment of that class of work their imagination and studies were directed.

In the thirteenth century variations were introduced, and they became more marked in the fourteenth century. The difference between the French and English methods can be judged, says M. VITET, by comparing St. Ouen, Rouen, with the choir of York Cathedral. There is a wide difference in the detail, and as time went on French and English Gothic separated more and more until at last they

* *Encyclopédie de l'Architecture et de la Construction.* Directeur P. Planat. Vol. V. Paris: Dujardin et Cie.

Etudes sur l'Histoire de l'Art. Par L. Vitet, de l'Académie Française. Deuxième Série. Moyen-Age. Paris: Lévy Frères.

seemed to be antipathetic. The relationship between the two nations was ignored; each sought after its own civilisation and poetry, and consequently each must have its own architecture. The loss to England by estrangement from France was seen in the Perpendicular style, in which, according to M. VITET, the mullions of the windows suggest the bars of a prison, while the introduction of transoms, by interrupting the ascending lines, shows an indifference to the true spirit of the style which the French and Germans respected up to the sixteenth century. Subsequently features were taken from Italian buildings and mixed with Gothic, as if unity of style was beyond recognition. It is only by means of borrowing and importations that English art has survived, and if ever the country should possess a special style, it will be owing to whims of an aristocracy that is rich and proud of a half barbarous civilisation.

Many more specimens could be given of M. VITET's method of philosophical inquiry, but our readers have no doubt more than enough already. His essay, which was much appreciated at first in France, is worth comparing with M. PLANAT's, not merely for the purpose of showing how differently a subject can appear to two writers, each of them being well informed, but rather for exhibiting two processes of conducting an inquiry. There is no doubt that the superiority lies with the more modern one.

PATENT OFFICE MISMANAGEMENT.

IN his remarks upon a paper read by Mr. L. EDMUNDS at the meeting of the British Association on the subject of the "Taxation of Inventors," Sir FREDERICK BRAMWELL certainly acted in a way that was worthy of his varied experience when he criticised the administration of the Patent Office, and pointed out that the specifications sold to the public are a disgrace to the staff. There is certainly reason for more liberal expenditure in the Patent Office, and more especially is it needful that some of the surplus accruing to that office should be devoted to proper administration. To cut down the fees, as some people have advocated, would be absurd. If a mechanic has an invention which is worth anything he can surely find 1*l.* to protect it for nine months. The procedure to be gone through is simple enough. Forms are obtainable without cost, and for sixpence anyone can buy a book of instructions which will give some information about the preparation of drawings and other details. An inventor need not necessarily put himself into the hands of a patent agent, for even if his spelling is defective his specification will be printed by Her Majesty's printers. There seems to be no regard of orthography in such documents, and hence we have seen the word "horizontal" spelt in three different ways in two lines. There is not apparently anything in the Patent Acts to necessitate the perpetuation of bad spelling in the specifications issued to the public, nor can the practice be influential in promoting beneficial inventions.

The surplus revenue of the Patent Office should be applied in the first place to the guidance of inventors. A man should not be permitted to waste his time and money on impossibilities. Government should protect him. But for that purpose it would be requisite to have examiners who were possessed of technical knowledge. Why cannot the authorities of the Board of Trade employ even one official possessed of common sense and mechanical skill? We who live in the birthplace of engineering ought not to be obliged to turn to America to be taught how to distinguish a possibility from an impossibility, either mechanical or physical. The authorities of the American Patent Office will not grant a patent for a perpetual motion machine until they receive a working model which fulfils the predicature of the specification, a model which never arrives. In that way the mistaken inventor is saved from wasting his money and his life on a dream. There are many schemes as chimeric as perpetual motion. Quite recently the old idea of pumping back steam which has done its work in the cylinder into the boiler has been revived and a patent granted for it in England. To multiply instances of patents for useless and impracticable things would involve, however, the filling of volumes. If any competent engineer will step into the Patent Office library and take a volume at chance he will soon become weary of the waste of paper upon notions that are only imaginative.

Beside acts of omission, there are others in which injury is done not only to inventors but to the country through the misappropriation of the revenue of the Patent Office, and that is in the payment for certain outdoor work. The late Mr. BENNETT WOODCROFT conceived the excellent idea of abridging the specifications, and so saving consulting engineers the trouble of wading through all the indexes and separate specifications. When it is considered that they cover the ground from 1637 to 1866, these abridgments were excellent. But what will the new set of abridgments be? When as many as 22,000 patents are granted in one year, it is evident that an abridgment of each class should be made under the conduct of a man or of men who have a practical knowledge of the subject-matter submitted for condensation. Under the present mode of dealing such a course is not followed. Specifications referring to husbandry have been sent to a professor of metallurgy, intricate envelope machinery to a lady, and miscellaneous engineering work to a music-hall artist. We have before us a record of the draft abridgments of nearly 1,000 specifications farmed out to a man who did not understand the questions involved, which comprised boilers, furnaces of all kinds and electrical apparatus. The Board of Trade pays five shillings per specification to the elect of the Patent Office examiners, and those who do the work receive from two shillings to two shillings and sixpence per specification. When such evidence is available, it seems time that the abuses should be taken in hand and an inquiry made by some independent authority.

LOAN COLLECTIONS.

THE following communication from the pen of Sir J. C. Robinson appeared in the *Times* of Tuesday:—

This subject has been brought into notice by a recent endeavour in the House of Commons to make the authorities of the National Gallery follow the example of the South Kensington Museum, in regard to the system of circulating works of art on loan, and it is notified that the matter will be again brought forward in the next session of Parliament. It is therefore ripe for discussion. Art matters, however, seldom receive adequate consideration in the House of Commons, and there is, I think, no place so suitable for entering upon it as your columns.

The question is a many-sided one, and is sure to give rise to much difference of opinion; it touches not only the National Gallery, but all our public museums, nor is it likely to be confined in its incidence to art and antiquarian museums. Our scientific collections will in the long run most probably have to conform more or less, according to their nature, to whatever *régime* is imposed upon the other institutions. My concern, however, is with art specialties alone; it will be for the scientists to take up the question for or against this *régime* when it touches them.

My justification for entering upon this matter will, I trust, be thought sufficient; it is that I have had a very long practical experience of the loan system, and that I am still officially occupied in carrying it out. Upwards of thirty years ago the first origination and organisation of the system at South Kensington, which has since attained such far-reaching extension, devolved upon me, and for nearly ten years past, as Her Majesty's surveyor of pictures, one of my principal duties has been to advise as to the loan of pictures and other works of art from the Crown collections, a practice which has been of very rapid growth and threatens in the near future to involve very difficult problems. That I am on the whole an advocate rather than an opponent of the loan system I desire to state in the outset, but I am far from being a fanatical partisan, and I am anything but an upholder of the *régime* as now carried out at South Kensington. The practice there has far outrun the original arrangements, and although it has doubtless effected much good and must in some shape or other be continued, I think that the time has arrived for regulating and in some respects restraining and abridging its action. This being so, if it were seriously the question of bringing the National Gallery or the British Museum under any such unmeasured *régime*, it would have no more thorough opponent than myself.

There are two main conditions touching this loan question which should be steadily kept in view and inflexibly upheld. The first is the absolute necessity for the preservation of unique and precious works of art from accident or deterioration. Consequently, in the great majority of instances, such works, in their nature, should not be moved about from place to place.

The second is that, as works of art cannot be in two places at once, all such works of great or paramount importance should have fixed and permanent abiding-places where they can always be found and referred to and not a fluctuating *status* rendering them liable to be not at home when they are most wanted. This amounts to the *dictum* that the precious treasures of our great metropolitan museums should be immovable, preserved with the most jealous care and attention, and not fatigued by secular use and ultimately worn out. Obviously such great establishments cannot be brought to every man's door; Mahomet must go to the mountain, for the mountain cannot be brought to Mahomet, be he ever so clamorous or powerful.

What then is there to be done? Does this mean that our great metropolitan museums are to remain central storehouses only, taking no part in the extension of art culture beyond their own walls? To this I answer, certainly not, but that on the contrary there is, consistently with the conditions I have indicated, a practically boundless field of operations before them.

Of provincial museums and special exhibitions the name is now legion, and every day sees fresh growths, not only in every part of the United Kingdom, but in our colonial centres as well. The promoters and managers of these institutions are clamorous for State assistance; if it were desirable, it is now too late to retrace steps which have already been taken. The loan movement then must go on, more especially since it is obvious that direct pecuniary assistance cannot be given by the Imperial Government to provincial museums and galleries.

Of course, whatever the State does should be well done; it is altogether inadmissible that any art but the highest and most genuine should be countenanced or promoted by authority. It would be neither possible nor desirable to endow an indefinite number of widely-distributed local centres with great original masterpieces of art. Such works, especially of former periods, are limited in number and of ever-increasing costliness; and for obvious reasons it is far better that they should be aggregated in a very few European centres than frittered away and planted far apart. There is, indeed, a European solidarity of interest in this matter. It would, in fact, be better for the majority of Englishmen even that, for instance, such a masterpiece as the great Holbein just acquired for the National Gallery, failing its permanent location in London, should have found a home in Paris or Berlin, rather than in Edinburgh or Dublin.

Our great provincial centres will then have to establish and maintain art galleries and museums from their own resources, and they are well able to do so. Direct pecuniary assistance from the State is out of the question. Imperial help and guidance of another kind, however, they may justly claim, and it is the thoughtful and effective organisation of this indirect help which is now the question before us. Great and precious masterpieces, then, be they pictures, drawings, sculptures, goldsmiths' work, pottery or in whatever shape they have embodiment, as a rule must remain the fixed appanage of metropolitan, not the occasional and fluctuating ornaments of provincial centres. From the nature of many of these categories the specimens could not be frequently moved about without certain deterioration and the risk of ultimate destruction. The pot may go often to the well, but it is broken at last. When I say that the time has come for restraining to some extent the South Kensington practice in the matter of circulation of loans, I mean not that there has been too great liberality in this respect, but that adequate care and discrimination have not been shown in the all-essential matter of selection, *i.e.* in the determination of what might or should, and what should not, be rendered movable.

If, however, it will be objected, provincial museums and galleries are not to expect from the State either the permanent cession or the temporary loan of great masterpieces of art, and at the same time are to be given no encouragement to acquire such works from their own resources, what remains for them to do? Are they to become merely secondary repositories for all such dubious treasures as are not considered up to the mark of metropolitan standards? As a matter of fact, this is the present *status* of the great majority of these institutions, and by aiming at the impossible it is likely to continue so. Local managers of such institutions seldom have the knowledge, and in the nature of things they cannot have the opportunity, to bring about higher results. Their aims and objects, then, must be different.

The fundamental bases and objects of provincial art institutions should be educational, and it is in this field that the State can and should render infinite assistance. London, Paris, Berlin, Vienna, Florence and Madrid are, and must remain, the chief abiding-places of the world's choicest art treasures, for those treasures are, in truth, the common property of the world at large, and every year's abridgment of the obstacles of time and space and the amelioration of international community render them more and more so.

These treasures nevertheless can, from the marvellous results of modern invention, be, as it were, garnered together and brought home to every man's door in guise scarcely less vivid and truthful than in their original garbs. In other words, an infinite number of marvellous and most perfect reproductive processes have in our time enabled nearly all classes of works of art to be practically multiplied *ad infinitum*. In this field of artistic reproduction, it is true, South Kensington has done much; but here, again, the lack of adequate directing power has gone far to neutralise the efforts made. There has been a sufficiency of zeal and no lack of funds, but the knowledge has been wanting. It is mainly the gathering together and the wise ordering of this immense material which local art institutions should take in hand, and in this practically boundless field the State should take the lead, and every metropolitan institution be called upon to assist.

Moreover, all our metropolitan museums and galleries are sure in the long run to become overburdened with much original matter, genuine and beautiful works of art, which nevertheless, as duplicate specimens or of minor value to others subsequently acquired, could be got rid of with positive advantage.

In the collocation of such superfluous original typical examples, with photographs, engravings, casts, &c., of the greatest masterpieces of similar kinds, lies the boundless field I have indicated. Such a work is not less difficult or less worthy of the most eminent and gifted specialists than that of the actual conduct of our great metropolitan museums. It is a field in which at present the labourers are few and the incentive advantages uncertain. It is for the State to seek out and properly remunerate and encourage duly accomplished and devoted workers.

BIRMINGHAM ART SCHOOL.

AT the opening meeting of the session of the Birmingham Art School the Mayor said he was very glad to congratulate Mr. Taylor, his assistants and the students upon the result of the last year's work. The figures received from South Kensington showed that they had eclipsed themselves, and considering what they had done in past years that was saying a great deal. For many years past their chief competitor had been Manchester, and, whilst a year or two ago they were a little behind, they had this year passed Manchester in the race, and while he should not like to say anything to hurt the feelings of their friends in the north, yet Manchester was nowhere compared with themselves. They were able to compare themselves, not only with English towns, but with those in Scotland as well. He was staying a week ago with a friend who was interested in similar work at Aberdeen, and in the course of conversation that gentleman said, "Aye; but you have no idea what a wonderful school that at Glasgow is." He (the Mayor) was willing to admit that at the moment he knew nothing at all about it, but he ventured to assert that the Glasgow school was "not a patch" on the one at Birmingham. He thought he was perfectly safe in making such a statement, and it was fully confirmed by some particulars which had been furnished to him by Mr. Hytch. The Glasgow authorities were very proud of their institution, and in stating the results of their competition for the year they put this note:—"These results place the Glasgow Schools of Art, with those of Manchester and Birmingham, as the most successful schools of art in the United Kingdom, and the medals taken equal those awarded to all the other schools of art in Scotland." That was a very good note, and they had quietly put themselves in very excellent company in the shape of Manchester and Birmingham. He would give them particulars of the Glasgow competition as compared with their own. They had each got one gold medal. Glasgow had got five silver medals and Birmingham six. Glasgow had eight bronze medals and Birmingham had ten. Glasgow had seven Queen's prizes and Birmingham thirty. Glasgow seventy-eight third-grade or highest prizes and Birmingham had 243. Glasgow had twelve prizes for advanced examination against twenty-one given to Birmingham, sixteen free studentships against thirty-eight at Birmingham, and twenty-one second-grade prizes against Birmingham's fifty-six, or a total of 148 prizes and free studentships against Birmingham's 405. Out of 2,015 works selected for the national competition 120 works were chosen from the Glasgow school against 290 from Birmingham. Glasgow obtained 245 passes in the advanced local examinations, an increase of 103 on their last year's record, but Birmingham passed 442. Forty-nine Glasgow works were accepted for the art masters and teachers' certificates against Birmingham's 217; while 209 passes were made in the second-grade examinations and building construction against Birmingham's 561, making 503 for Glasgow against 1,220 for Birmingham. He thought it would be agreed that when their Mayor did go into foreign parts and made a statement concerning them, he was always strictly within the limits of truth. So much for Glasgow. Now with regard to their own branch schools. The figures as compared with last year were extremely interesting. The results were as follows:—In 1891 the total number of papers sent in was 1,551, of which 814 passed, against 1,362 last year, of which 688 passed; in other words, 52½ per cent. passed this year against 50½ per cent. last year.

The branch schools also received a bronze medal and a national book prize, twenty-five third-grade prizes, and thirty-three works were accepted for the art teachers' certificate. He thought these results were subject for extreme congratulation, but they must bear in mind that having attained to this high standard, they must not fall back. With the thorough grounding the students had under excellent teachers, he believed there was no fear of retrogression, but it was quite possible that the results to which they had attained would not be kept up without a great deal of hard work. Mr. Hytch also mentioned a matter which he thought would interest them. It was that Mr. Oliver Wheatley, who had obtained the gold medal for modelling, was a working modeller and designer for electro-platers, who eight years ago joined the Smith Street branch school. He remained at that school for two years, and then came to the central school. For some years he was only able to attend the school in the evening, but in 1888 he obtained a scholarship of 20*l.* per annum, tenable for two years, and this enabled him to give part of his daytime to attendance at the school. This record showed that it was quite possible for a student in a branch school, working in the day and attending the school in the evening, to obtain some of the highest rewards, and they might congratulate themselves on Mr. Wheatley's success.

Mr. Taylor, the head-master, also addressed the students. He said he observed with great pleasure that many of their architectural students were going through a thorough course of art study, instead of as formerly only such art as should be expressed with the T square and compasses. In previous years local prizes had been offered for architectural designs of modest pretensions. This year it was an open competition as to subject, and he warned students against attempting cathedrals, colleges, municipal buildings, &c., but rather to attempt such class of subjects, moderate in size, as had been selected in previous years for competition. He heartily congratulated masters and students on the all-round success of the year.

THE GREEK THEATRE.

THE first theatres that were constructed at Athens afforded, like the drama at its origin, but a faint outline of the magnificence which characterised them afterwards. They were of wood, and hastily erected, consisting of benches gradually ascending. These in course of time gave place to structures of more solid and permanent materials, in consequence, as we find it mentioned in Suidas, of a fatal accident having well nigh taken place from a sudden fall of the benches during the performance of a tragedy of Pratinas.

In their details respecting the Greek theatres, moderns have been in a principal degree obliged to compile their accounts from writers who have treated expressly on the subject, amongst whom Julius Pollux and Vitruvius occupy the chief rank. These and the traces of ancient theatres which are still extant, supply in some measure the want of any certain light derivable from the Dionysiac theatre of Athens, the vestiges of which are so scanty as to leave even its site in some degree of doubt. Stuart conceived that he had ascertained it in that of ruins which later travellers have pronounced to belong to the Odeion of Herodes, assigning the locality of the former to the south-eastern angle of the Acropolis, as well from the existence of choragic monuments in that quarter, as of a temple of Bacchus (Dionysus) from which a statue of that god was taken which is now deposited in the British Museum. A hollow in the slope of the hill which now exists points out the place where the seats of the spectators must have been excavated.

The entire outline of the building, as it lay on the hollow of a hill, must have been that of a semicircle with its arch upwards, joined to a parallelogram of considerable breadth at its base. Between the apex of the semicircle and the rocks of the Acropolis above it, it is scarcely conceivable but that some communication was opened; yet it must have been very narrow, in order to prevent the escape of sound from below. The main entrances to the theatre were at the opposite ends of the parallelogram below the spectators' semicircle, or at the right and left extremities of the dromos, which extended in front of the stage and its flanking walls. The upper part of the theatre, which was appropriated to the spectators, was enclosed by a massive semicircular wall and a portico within it, which served as a station for the slaves who attended their masters to the play, and also as a place of resort for the spectators, independently of the double portico, the eumenic, as it was called, which lay behind the scenes. Inside of that wall and portico the benches descended (for we conceive ourselves to look down upon the stage) in concentric semicircles, which diminished as they approached and embraced the protruding crescent of the orchestra. The curvature of the seat-rows thus inclined the faces of all the spectators towards the centre of the building, so that the terminating seats on the right and left were duly opposite each other, like those of our boxes nearest the stage. The entire amphitheatre of seats was divided into belts or stripes by passages sweeping round them in profile, and again into wedge-like masses by flights of steps that radiated upwards from the lowest to the highest benches. Twelve feet lower than the lowest benches, yet still projecting into their convexity, came the crescent of the flat orchestra, which was never occupied by any spectators. In the middle of the basis-line of that orchestral crescent was the thymele, a slight square elevation with steps, and a platform, which was the rallying point of the chorus. Around this the dances of the chorus described a small circle, the one-half of which was within the orchestral crescent towards the spectators, the other behind the thymele, and stretching nearly to the front stage. A part of the orchestra-ground entered, therefore, into the dromos. After enclosing the spectators and the interior orchestral crescent in one vast semicircle, the walls of the theatre ceased to describe a curve, and ran on straight to join the right and left extremities of the paraskenia, or flanking buildings of the stage. Of course they thus formed the two ends of the dromos, and the continuity of their masonry was interrupted only by the two grand and opposite entrances to the theatre. To protect the actors from the inclemency of the weather, these entrances were covered in; indeed, the whole stage was provided with awnings for that purpose; but the spectators were left very much to their own resources until the period of the erection of the large Roman theatres, over the entire of which coverings were extended. To supply this deficiency in some degree in the Greek theatres, the porticoes above-mentioned were constructed within the precincts of the building.

The stage-ground with its flanks (paraskenia) formed a line as broad as the amphitheatre of spectators; but the stage itself was somewhat narrower than the orchestra, to which it was directly opposite. The level of the stage was the same as that of the lowest benches; consequently, as many feet higher than the orchestra; but the whole wall of the stage-ground rose to the same height as the wall on the outside of the highest benches. The stage was connected with the orchestra by stairs, for though the choral and stage performers had a generally distinct locality, it is evident that there was a connection in acting between the orchestra and the stage. The stage itself was twofold. One division, called the logeion, projected beyond the paraskenia, and being meant merely for declamation, was constructed of wood, the better to reverberate the voice. Behind it there was a chasm for holding the roll of the curtain, for that disguise, though it was seldom used, was drawn upwards by the Greeks, and not downwards, as in our theatres. Immediately behind the logeion lay the proskenion, or proper stage, which having often heavy plastic scenery to support, was made of stone. This was the division of the stage particularly appropriated to the actors. The entrances into it were from a temple, or some ornamental structure placed directly behind, and two other edifices of inferior size and decoration at the flanks, in the apartments of which nearest the stage were kept the machines for moving the scenery. The first of these buildings was appropriated to the persons of the drama of the highest rank, while those of the lower entered from the last two. Their upper apartments were termed episkenia, wherein the movements were executed by which the phenomena of stage exhibition were represented, the lower paraskenia, the tiring rooms of the actors, from which there were passages into the orchestra exclusively of the one already mentioned, whereby it was connected with the stage.

The scenery employed by the Greeks was so contrived as to turn round or draw aside, the latter corresponding to that used in our theatres. The decorations which it was necessary to introduce in order to mark the locality of the piece were of two kinds, the lower, plastic imitations of objects, chiefly in wood, the upper, paintings on canvas or boards. They must have been highly imposing, as the Greeks availed themselves of every opportunity to affect the senses; and the knowledge of perspective, which it is now well ascertained they possessed, as well as the ample dimensions of their theatres, afforded them abundant means of doing so. To such an extent was this carried, that they spared not on some occasions—for example, the representation of the Œdipus at Colonos—the introduction of natural trees to adorn the landscape. They had also their theologeion, or place of conference of the gods, which was surrounded by a picture of clouds, and issued most probably from the top of the central stage-building. The charonic steps were situated at the extremity of the orchestra farthest from the stage, and beneath the lowest seats of the spectators; through these infernal spirits and phantoms ascended. The impressions made on a superstitious people by such representations can be but faintly estimated by our less credulous imaginations; yet even a modern fancy must be torpid, that, in reading Æschylus, experiences not high excitement when the ghost of Clytæmnestra rushes in to awaken the Eumenides; and the grandeur of terror in spectral agency was certainly never made more perfect than where that poet invokes "the slumbering furies and the sleepless dead."

TESSERÆ.

English Blazonry.

IT is sufficiently clear that at an early period of the art of blazon, long before the incorporation of the College of Heralds, not only the military but also the commercial section of the community had their appropriate and significant coat-armour. The absolute necessity of seals for legal purposes must have contributed materially to its fabrication. In the third seal of one charter the devices are not placed upon a shield, and in the anonymous seal the leopard's head is not the charge of a shield, but an attendant badge; but when the badge or device, composed either of one or more figures, was once, as in the other examples, placed upon a shield, it settled into a "coat of arms," and, handed down in that form to posterity, it became the symbolic evidence of descent, alliance and consanguinity. Even in the reign of Edward I. the fraternities of London had their several cognisances or badges, worn on the sleeve in the same manner as for many subsequent centuries by the retainers of the nobility, and still by the almsmen of some public charities and by watermen, firemen, &c. When the citizens, in the year 1299, went out to meet the new Queen Margaret they were all attired in one livery of red and white, but had on their sleeves the distinctive badges of their crafts. Fabyan's "Chronicle" says:—"The quene was conveyed unto London, agayne whom the cytezyns upon the nombre of vi. C. rode in one lyverey of rede and whyte, with the conysaunce(s) of dyvers mysteries browderyd upon theyr slevys." It would be an interesting discovery to find a list of these cognisances, and to learn how far they have been handed down in the existing shields of the companies and of private families.

The Camp at Wimbledon.

In his work on "The Environs of London" the Rev. Daniel Lysons describes the entrenched camp at Wimbledon as of circular form, double ditched, and enclosing an area of about seven acres. He says that this camp was called, in the time of Camden, Bensbury, who considered it to mark the place of the battle between Ceaulin, King of the West Saxons, and Ethelbert, King of Kent, fought in the year 568. There appears to be no other foundation for this suggestion than the following statement of the Saxon Chronicle under that date:—"This year Ceawlin and his brother Cutha fought with Ethelbyrht and drove him into Kent, and they slew two aldermen, Oslac and Cnebba, at Wibbandun." Camden probably thought he identified Wibbandun with Wimbledon, and Bensbury as Cnebban's Bury, the sepulchre of Cnebba. There is no necessity for controverting these hints of the father of British archæology, although there may be reason for assigning a much earlier period than the sixth century for the entrenchment extant at Wimbledon. Round the exterior side of the ditch a way was constructed, protected by a parapet of earth, affording a position for a line of armed men, who would be supported by a second line of defenders whose javelins or arrows might be propelled over the heads of the first line, thus subjecting an assailing enemy to the galling effects of a double discharge of missile weapons. Writers on the military antiquities of Britain have considered that it was a principle of tactics with the Britons to arrange their forces on concentric circles of ramparts rising one above the other, and that the celebrated Herefordshire beacon on the Malvern hills is a remarkable specimen of that mode of defence. We have but few rules for discriminating between Roman and British fortifications. There is no decided ground for supposing that the Romans often deviated from the square form of castrametation which their military writers have described. When they did so it was probably for the purpose of taking advantage of a peculiar position of ground. Thus, an area surrounded on three of its sides by a river would be protected on its fourth by a vallum and foss, forming as it were the string of the bow. Of this mode of arrangement a very striking instance is to be found at Bittern, near Southampton, the ancient Clausentum. Now, where all positive evidence of the period and people to which the construction of an ancient earthwork may be assigned is wanting, we can with great degree of confidence refer to the appellation which it may have retained in the course of ages. In whatever name vestiges of the British term Dinas, Dunum, Din—often softened into Ton or Tune—may be found, there we may suppose a British origin to be indicated. The word implies a fortified elevated post, and that it sometimes only designates an elevation, as Rainham Down, Barham Downs, the South Downs, &c. The application of the British word Din or Dunum to fortified cities will be traced in the places mentioned in ancient itineraries which have descended to our time, as, for example, in Londinium, Sobiodunum, Camalodunum, Muridunum, Uxellodunum, &c. These British Dunes were the oppida described by Cæsar; they were placed on elevated spots, often surrounded by woods, and most commonly near springs of water. The Raths of Ireland are fortresses assignable also to Celtic tribes. On the advent of the Saxons, British and Roman military enclosures frequently obtained the titles Burgh, Byrig, Barrow, or Ceastre in exchange for their more ancient names, Gaer, Dune, Castrum, &c. And Dune was often softened into Ton. Thus Sobiodunum became Sarisbyrig, and Cæsarisdunum or Kæsarsdun, a well-known Roman post, was converted into Keston. Now we may remark that the entrenched camp at Wimbledon has all the characteristics of a British stronghold; it is still placed in the vicinity of woods at a short distance from Coombe Wood near Kingston; oaks at this day are still growing on or close to its ramparts, the offspring of an older family of forest trees. There is a fine spring of water in an adjacent hollow commanded by the works, and in the range of the horizon from Epsom Downs southward, to Harrow, Hendon, Stanmore, &c. northward, the eye traverses a broad expanse of country. The termination Don proclaims indelibly its British origin, and we may concur with Lysons in the idea that the prefix syllables have been conferred from a Saxon proprietor, Wimbald, which he tells us is a Saxon name. Two points of history are, therefore, laconically comprised in the name Wimbledon, namely, that a British dune or fortress was established on this elevated spot which passed at length into the possession of a Saxon lord.

Early Irish Habitations.

Despite the dignity of Hibernian heroes from the days of Pelagius and St. Patrick in the fifth century, and the respect their schools and colleges acquired abroad, their habitations and those of their countrymen and cotemporaries appear to have been of the very simplest. Detached houses of stone were erected only at somewhat late dates, that material in early days having been reserved almost exclusively for the round towers and crosses, the small churches and the military defences with the rude huts enclosed within them. The dwellings themselves appear to have been constructed for the most part of wood or of wattles, with clay filling in the interstices. Remains of ancient stone and earthen forts, in which numerous habitations were included, are still frequently met with throughout Ireland, though vast numbers have no doubt been destroyed by time and from the land having been brought more generally into cultivation. The fortresses known as Cahirs (Caer. Welsh?) or Cashils (Castles?), amongst which are Tailtin, Tlachtgha, Tara, Croghan, the Grianan of Aileach, in the county of Donegal, &c., are built invariably of stone, and appear to have been the strongholds of the then numerous princes and chiefs together with their followers. The hill forts, called "Duns" or "Lisses," though occasionally formed of earth when stone was difficult to be procured, are chiefly built of the latter material, and entirely without cement, the walls often being many feet in thickness. They are generally circular, and all contain small chambers, consisting only of flat stones laid across large upright ones, and from the quantities of bones found in some of them they appear to have been used as well to contain stores of provisions as for the protection of the women and children. The earthen forts called "Raths" are chiefly, if not exclusively, to be found in the plain. Like the stone forts, their enclosures are generally circular, and in the raths these are always formed of an earthen embankment from four to eight feet in height, which was probably strengthened by a wooden stockade upon it. In some cases these forts were rendered more difficult of attack by the addition of a ditch, which surrounded them outside the embankment. Mr. Wakeman, who has carefully studied these singular constructions, states that "of the number of raths which he had examined he had not in one instance known the mound to contain a chamber, but when the work consists merely of the circular enclosure of which mention has been already made, excavations of a bee-hive form, lined with uncemented stones and connected by passages sufficiently large to admit a man, are not unfrequently found. These chambers were probably used as places of temporary retreat, or as storehouses for corn, &c., the want of any ventilation save that derived from the narrow external entrance rendering them unfit for the continued habitation of man. We are not aware that any rath in the neighbourhood of Dublin contains a chamber or chambers of this kind. They are common only in the southern and western parts of Ireland, but subterraneous works similar to those usually found in the forts of Connaught and Munster occur in Meath, and perhaps in other Leinster counties." Within these defences, whether of stone or earth, were usually built the huts of wood or wattle and clay, or the small stone cabins called Cloghauns or Clochauns, in which the people lived, the enclosures giving protection not only to them, but also to their cattle and stores, which in those days were in constant danger from robbers, beasts of prey, or the attacks of hostile tribes.

Clay Puddle.

Puddle is as great an auxiliary to the engineer as concrete, and the best definition that can be given of it is in the following words—a mass of earth reduced to a semi-fluid state by working and chopping it about, while just sufficient water is applied, until the mass is rendered homogeneous and so much condensed that water cannot afterwards pass through it. The best

puddling stuff is a rather lightish loam with a mixture of coarse sand or very fine gravel in it; the very strong clays are inferior on account of the great quantity of water which they will hold and its disposition to shrink and crack as this escapes; anything in the shape of top-soil is entirely improper on account of the quantity of roots and vegetable matter it contains. When a puddle ditch has been dug clear out to its proper depth about nine or ten inches in depth of puddling stuff is thrown in, from which all large stones, sticks or weeds are carefully picked out; water is then ladled in with a scoop, so as to give the puddling a good wetting. If the puddling stuff be stiff or dry it may then be left for two or three hours, merely giving it another wetting in the meantime if necessary. The puddler may then proceed with his work. Being provided with a stout pair of puddling boots, he begins at one end of the trench and keeps chopping with his tool, and quite through it, giving his tool a lunging move every time before he withdraws, so as to let the water into the puddling stuff and stir it right through; if more water be wanted another labourer supplies it as the puddler works on. This man thus proceeds chopping and trampling over every inch of the ground as he works down the trench until he gets to the end, he then returns and repeats the operation until the stuff is thoroughly worked up. This is ascertained by the tool going with equal ease through every part of the stuff, which it will not do if there are any dry, hard lumps. A proper quantity of water is very essential to this work, and it may often have to be brought by means of a trench from some stream or pond at a distance to the works. When this is necessary care must be taken to provide the means of carrying the water off when it is not wanted. When the first course has acquired some solidity it will be time to lay on the second course, which must not be of greater depth than ten inches; water is then applied and the puddling recommences, care being taken that the tool at every chop sinks right down through the upper course into the lower one, so, as it were, to bond them together. A trench thus puddled should never be left uncovered so as to dry. As the puddle is raised, two or three rows of sods or spits of earth should be raised on each side to raise the bank, if the puddle-trench be in a bank, and the slopes are formed gradually on each side by fresh stuff being wheeled up until the bank is entirely formed, and then the puddle is covered completely up with ordinary stuff until the bank is raised to its proper height. Where the light loam is not attainable but only clay, mix sand or fine gravel with it if attainable; if only gravel, screen it so as to get rid of all stones larger than a bullet, mix clay with this if attainable, or chalk where it is to be had. A great part of the difficulty lies in the working of the stuff. The real value of puddle, properly made and well worked, may be ascertained by any one who has had an opportunity of excavating into it years after it has been formed. Having pointed out the great advantages of puddle, it will be desirable to say a few words of its disadvantages. This useful building auxiliary is liable to contract from summer heat if exposed to it, and therefore requires to be protected from this influence, and it will be the more liable to contraction if much water has been used in the working of it and if composed of clay. This is one of the reasons why sandy loam is preferred, and in some cases even fine gravel mixed with chalk, or over which a grouting of rich lime is poured as the puddling process is carried on.

Early Explorations in England.

Under the Anglo-Saxons, down to a late period, our island appears to have been covered with the majestic remains of Roman towns and cities, although people had been gradually clearing away many of them in order to use the materials for new buildings. As early as the middle of the seventh century when the monks of Ely wanted a stone coffin for the body of the Abbess Etheldreda, they sought for it among the ruins of the Roman town the site of which is now occupied by the town of Cambridge. Bede relates how they "came to a small deserted city which, in the language of the Angles, is called Grandchester, and presently, near the city walls, they found a white marble coffin, most beautifully wrought, and neatly lcovered with a lid of the same kind of stone." At a much ater period we shall find the Abbots of St. Albans collecting the materials furnished by the ruins of Verulamium (or, as the Saxons called it, Wærlam-ceaster) to build their church. Many Anglo-Norman works still existing are built in part of Roman materials. We find also that at an early period people, not content with taking what was above ground, made excavations under the soil in search of the relics of ancient days. It seems probable that the different tribes who occupied the ground frequently opened the barrows of the tribes who had preceded them in search of treasures. The earliest mediæval poems, such as the romance of Beowulf, speak of the treasures of a primeval age, consisting of cups and other vessels, personal ornaments and weapons, rescued by their heroes from beneath the tumulary mounds of the giants, according to the belief of the unconverted Germans, or of the heathen according to the Christianised notions. We hear of the opening of barrows as late as the thirteenth and fourteenth centuries, and the discovery of funereal deposits and of treasures. The Anglo-Saxons appear to have collected immense quantities of articles of Roman manufacture by excavating, particularly vases and other vessels of different materials, and the earlier rituals frequently contain forms for blessing these implements of pagan manufacture in order to make them fit for Christian use. One of these benedictions ("Benedictio super vasa reperta in locis antiquis") prays the Almighty to "deign so to cleanse these vases fabricated by the art of the Gentiles" ("hæc vascula arte fabricata Gentilium") that they may be used by the believers in peace and tranquillity; and another runs in these words:—"God, who by the coming of thy Son our Lord hast cleansed all things for thy believers, attend propitious to our invocations, and cleanse by the amplitude of thy grace these vessels, which, by the indulgence of thy piety, after a length of time being taken from the gulph of the earth, thou hast restored to the use of men." In many instances, particularly in the earlier times of the Anglo-Saxons, these Roman utensils appear to have been buried again in Anglo-Saxon barrows, which accounts for the discovery of mixed deposits of earlier and more recent articles in one place. The traces of these excavations appear not unfrequently in popular legends. It seems probable, from legends preserved by the old chroniclers, that the Italians of the tenth, eleventh and twelfth centuries penetrated into some of the Etruscan tombs. Gerbert, the mathematician, after he had become pope as Sylvester II., was a great excavator. A story told of this celebrated man by William of Malmesbury, and which afterwards entered into the compilation of tales known by the name of the "Gesta Romanorum," seems to refer to the discovery of some spacious subterranean tomb of the early inhabitants of Italy; and the same historian tells us that in the eleventh century the Romans discovered the "body of Pallas, the son of Evander." More than a century after this a tomb was opened in the neighbourhood of Glastonbury which, it was pretended, contained the body of King Arthur.

Cologne Cathedral.

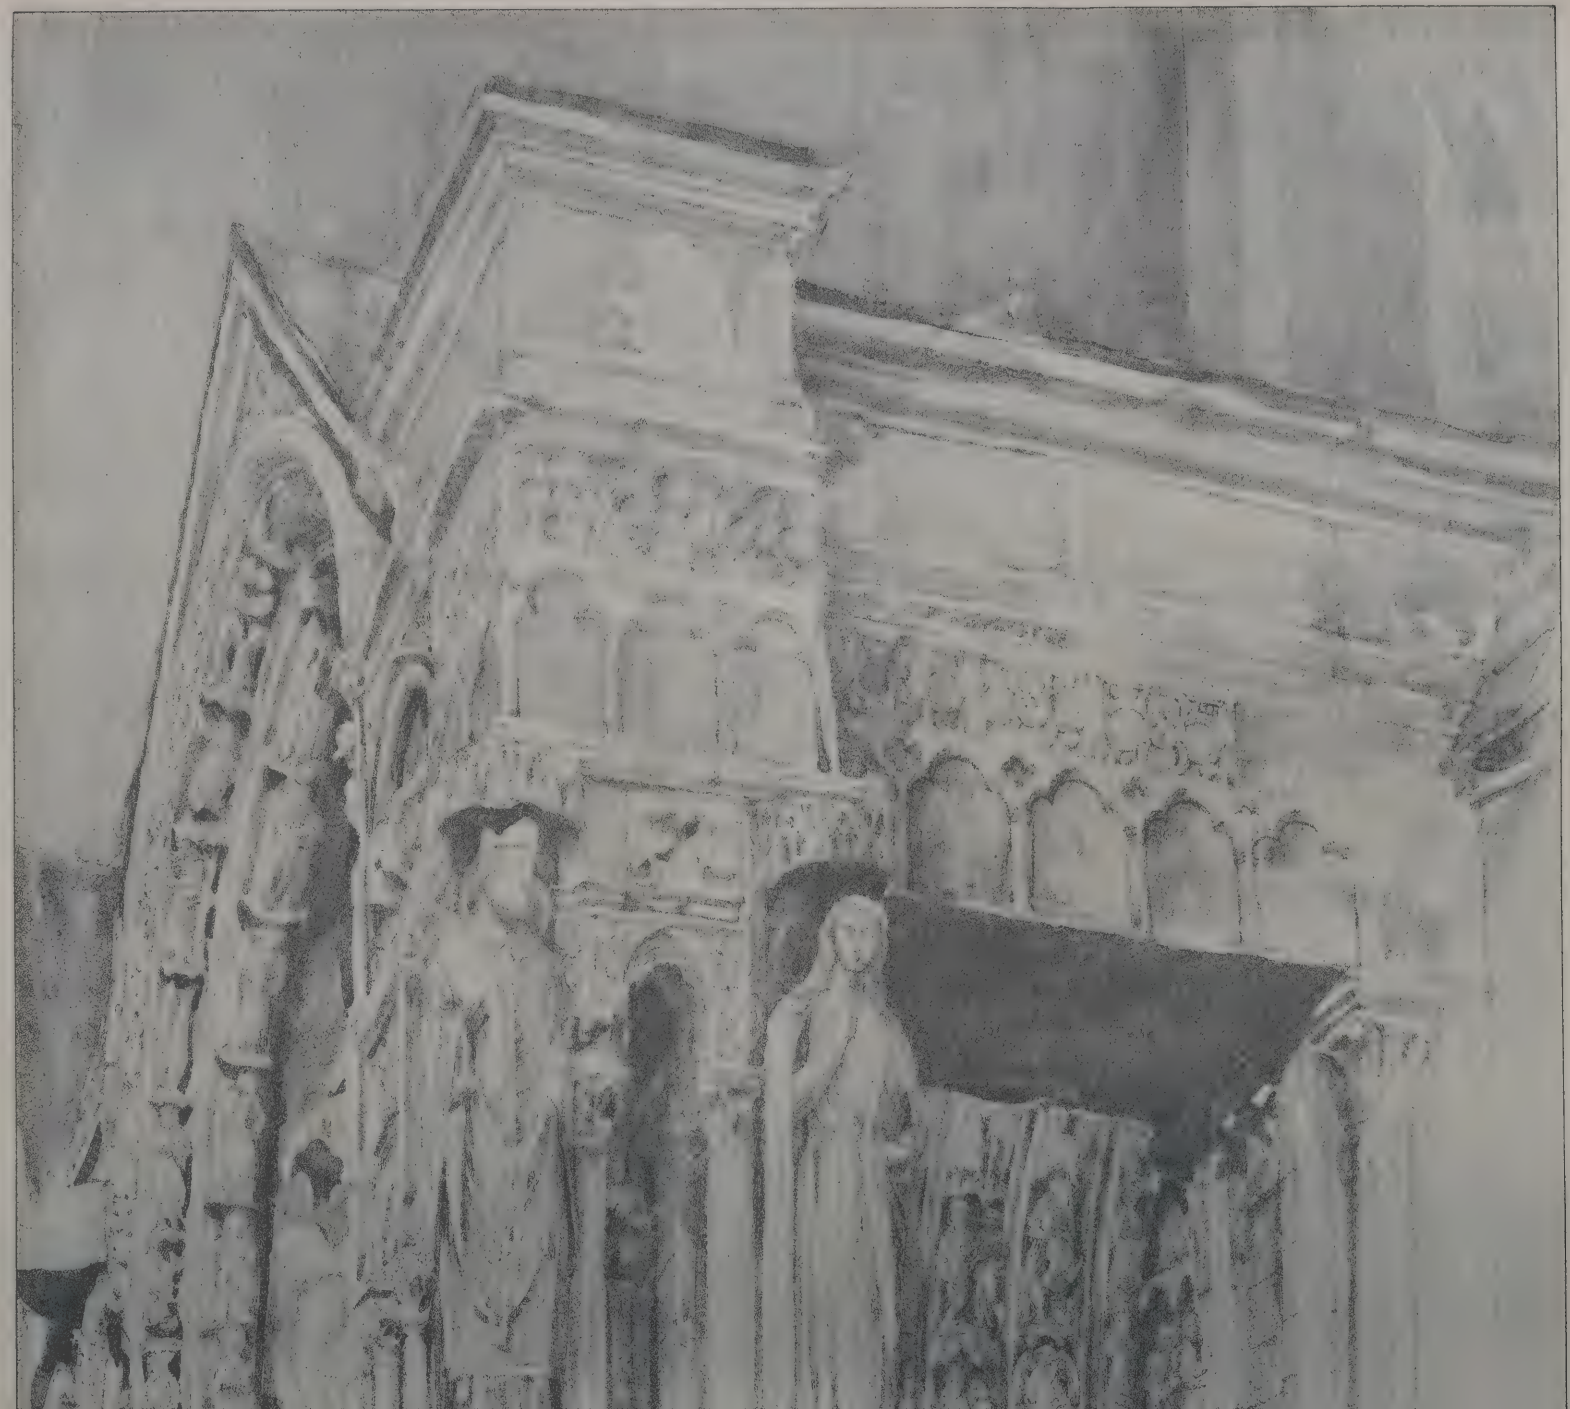
The original intention comprehended choir and double transepts, a stately nave with double aisles, a centre tower where nave and choir join, and two towers at the west end. The internal height of choir and nave alike, namely, 150 feet, that of the aisles and transepts 64 feet, the whole length of the building 500 feet, its width 150 feet, and the height of the towers 536 feet, which would have made them the highest in Christendom. Of this, the choir was finished, with a portion of the east wall of each transept. The north aisles had attained their destined height, the four great windows complete, with coloured glass in them, and seven compartments of the roof groined over. The south aisles had stopped midway, their interior piers having only reached the height of 42 feet, and the windows being arrested at the spring of the arch. The southern tower had grown up in two storeys to the elevation of 170 feet; the northern tower stood like a tooth just piercing the gum, one pier partly through to the height of 22 feet, the rest still below the surface. Part of the façade of the northern transept was visible about six feet; and of such portions of both transepts, west front and northern tower as were not yet above the earth, the foundations were supposed to be perfect within. Thus there was a gap between choir and aisles, another between north and south tower, and a vacant space in the nave. In other words, the head was perfect, the shoulders just begun, the legs with one foot partly grown, but the whole body still wanting. For present use, therefore, temporary roofs had been thrown over the southern aisles, and such compartments of the northern as had not been groined with stone. The gap between choir and south aisles was filled up by a temporary wall; that between choir and northern aisles supplied by the intrusive church of Sta Maria, and a wooden screen run up between the two towers. Thus stood, therefore, the incomplete form of an all-complete idea, from which, as from a text-book, almost every religious edifice erected contemporaneously had drawn instruction, which had contributed to build Strasburg near and to finish Burgos afar off, and which shows its helping influence in Freiburg, Ratisbon, Prague, Utrecht, Amiens, Beauvais, Chalons, and numerous other foreign churches that might be mentioned, besides supplying an architect to our own York. There stood the imperfect specimen of the most perfect period of ecclesiastical Gothic, so full of thought that every detail has a meaning, so practical in adaptation that every detail has a use, so true in structure that were the walls knocked away it would still stand firm on its piers like a tent; and, with all these causes combined, so perfect in national beauty that Boisserée has christened it "the Canon of German architectural law." And centuries passed away without knowing it to be such. Nay, far from appreciating the tenth wonder of the world that stood among them, men looked upon it with ill-will, as a monstrous mistake, which the barbarity of their forefathers had entailed upon them, an eyesore to their city and a drain to their pockets, and to be kept standing only to avoid the greater cost of pulling it down.

NOTES AND COMMENTS.

THE fourth centenary of the discovery of America by the "royalest sea-king of them all" will be celebrated next year in Spain. It is proposed to have, among other manifestations, a retrospective exhibition containing objects illustrative of the art of the fifteenth, sixteenth and part of the seventeenth centuries, in order that the degree of civilisation then attained by Europe, and especially by Spain and Portugal, may be understood. It will also serve to suggest the influence of the discovery of America upon Europeans. The exhibition will comprise sculpture, painting, engraving, mosaic, goldsmiths' work, panoplies, vestments, tapestry, bookbinding, illumination, furniture, pottery, glass, carriages, &c. The exhibition will be opened in Madrid on September 12, 1892—the anniversary of the landing of COLUMBUS (some maintain the date was a month later) at San Salvador—and will be closed on the last day of the year. Objects which are offered for exhibition will have to be sent in during April, either to Madrid or to the offices of local committees. All exhibitors will be presented with season tickets. A novelty in the arrangements is the institution of a competition among the exhibitors. The owner whose loans are considered to be most interesting will obtain a grand prix d'honneur. There will be also a gold medal, a silver medal, a bronze medal, and a certificate to reward those who possess exhibits that afford lesser interest.

WE lately called attention to the condition of the drains of St. Bartholomew's Hospital, which were likely to become a source of danger to the City. The civic authorities have not allowed the subject to be ignored. At the meeting of the Commissioners of Sewers on Tuesday, a letter from the clerk to the hospital was read. With it was a joint report of Mr. E. B. I'ANSON, architect, and Mr. COUSINS, C.E., as to the reconstruction of the drains, and they invited the observations of the Commission upon them. The works will cost 3,142*l.* It was decided that the plans be submitted to the medical officer of health and the engineer for their consideration and report. The works may seem to create an onerous burthen which the hospital committee may not easily support, but the removal of such a source of infection as the drains now present will be cheap at three thousand pounds.

STUDENTS of building construction may be glad to know that the courses of instruction at the Polytechnic will begin on Monday next. The classes are under Mr. C. F. MITCHELL'S direction, and the success of the students in various public examinations is the best testimony to the efficiency of the teaching.



IT is only to be expected in the United States that an excess of freedom should be enjoyed by the Custom-house authorities as well as by the ordinary citizens. The imposition of duties in the Custom-houses across the Atlantic now seems to be dictated by individual freakishness. Every week there are new surprises awaiting all who watch the proceedings of the officials. One of the latest relates to architectural photographs. For many years it has been customary among architects and students, says the *American Architect*, to send and receive photographs from abroad by mail. In old times, any one who wanted photographs of particular buildings could enclose a postal order to the local photographer, or to BRAUN, LÉVY, the London Stereoscopic Company, or any other of the great dealers, and receive the prints he wanted with little delay, through the mails, free from duties; or an architect travelling abroad could send photographs home to his office or to his friends in the same way. After a time, the Customs laws received a different interpretation, and photographs were held to be dutiable, but they could still be sent in the same way, and delivered to the person to whom they were addressed, on payment of the duties. Recently, however, the privilege of sending photographs by mail, which has existed in every civilised country ever since photography was invented, has been taken away from the citizens of the United States, so far as foreign photographs are concerned; and such photographs are declared to be unmailable, and orders are said to have been sent to all post offices to confiscate them. It is impossible to conceive that this new regulation should have any object, and the case seems to be simply one where the officials were obliged to conform themselves to a different and authoritative interpretation of the meaning of a law which, of course, they did not make, and which may not have been intended to have such a meaning. If so, Congress will probably set the matter right next winter; but, in the meantime, American architects and students must abstain from sending European photographs by mail.

SOME of the statues in the gardens of the Tuileries are affected injuriously by the variations in the weather. M. GUILLAUME, the architect, who has charge of the gardens as of the Louvre, is accordingly engaged at present in directing the restoration of the figures. It will be necessary to have all the reparations completed before the winter sets in. In such a case the voice of anti-restorers would be unheeded. The French, although scientists, are not partial to statues which display the power of the atmosphere to overcome the cohesion of the particles of the marble. Works rendered imperfect in that way would have their use in a museum, but as long as they remain in a garden or a public place it is well they should be pleasing to the eye. For a similar reason the French are careful to fight against time in their buildings, and perhaps they are right, for if restoration is allowable with statues, why should it be unlawful with buildings?

THE Hastings Guardians of the Poor, who have been for months amusing themselves with exciting discussions about a new workhouse, have secured a fresh means of diversion. No doubt it was imagined that the architect who supplied the plans which gave rise to the debates and from time to time altered his design at the behest of the Board would be rewarded by co-operating in the entertainment of so many deserving gentlemen. The eloquence of the guardians at last became exhausted, and with it the project for erecting workhouse buildings. The architect's plans having served their purpose were returned to him. He was not satisfied with the use they subserved, and accordingly sent in a bill for 5,587*l.* 15*s.* The arrival of the document has been most opportune, for the orators wanted another theme, which the bill happily affords. On its appearance operations began. There are a great many ways of dealing with the bill, all of which will be gone through, and it has to be settled whether the contests are to take place before the reporters. At all events, the architect need not calculate on a prompt settlement.

IT was reserved for the end of the century to set up a statue of the Chevalier BAYARD, the good knight who was fearless and reproachless. It will be placed upon a bridge which is about to be constructed over the river Breda, in the town of Pontcharra. The sculptor who has received the commission is M. PIERRE RAMBAUD, and he has represented the hero on horseback, with the visor of his helmet raised, and pointing with his sword extended towards Italy. The Château Bayard still remains, and parts are well preserved. It is tenanted at present by a priest, who has reached the age of eighty-six, and who seems to be the fitting mourner over the days of chivalry that are gone.

IN order to obtain more money to defray the cost of the memorial of the painter, it is proposed to hold an exhibition of the works of MEISSONIER in Paris. The use of the galleries of the Ecole des Beaux-Arts has been granted for the exhibition. A great many of MEISSONIER'S works are in the United States, and application for a loan of them has been made by the committee. There is, however, one obstacle which is enough to frighten the owners of the pictures—that is, the duty which would have to be paid to allow the treasures to re-enter America. In order to secure exemption, the French Minister of Foreign Affairs and his representative have been exerting themselves. It remains to be seen whether they can prevail with the officials at Washington. There will be less difficulty about obtaining works from England. It is not likely, however, that the Wallace paintings can be again obtained.

NO. 411.—NORTH PORCH, CHARTRES CATHEDRAL. [H. WILSON.]

MEMORIAL CHURCH AT COLSTON BASSETT, NOTTS.

THIS church is now being erected by Mr. R. M. KNOWLES, of Colston Bassett Hall, and when finished will take the place of the present church. The exterior of the new church has been erected in hammer-dressed Coxbench stone, whilst Hollington stone has been used for traceried windows, string moulds, parapets, copings, &c., and the interior is faced with hammer-dressed Coxbench stone, with Corsham Down Bath stone dressings. The roof will be covered with the Buttermere light-green slate. Our illustration is from the drawing exhibited in this year's Academy, the architect being Mr. A. W. BREWILL, of Angel Row, Nottingham, and the contractors Messrs. BELL & SON, of Sherwood Street, Nottingham.

DESIGN FOR A TECHNICAL COLLEGE.

THIS illustration is a reproduction of a drawing by Mr. A. D. SMITH, which was exhibited this year in the Royal Academy, and obtained much attention.

PHIDIAS AND HIS SCHOOL.

THE renowned artist Phidias, the son of Charmidas, was born about five hundred years before Christ. He was originally a painter, and he carried the arts of painting and sculpture to a greater perfection than they had ever before attained. His brother, Panænus, also painted the celebrated *Marathon* in the Pœcile. In the art of making statues of bronze, both for the number and excellence of his works, Phidias was without a rival. His *Amazon*, but especially his *Lemnian Minerva*, were for many ages the admiration of the world for their faultless symmetry. In works of ivory also Phidias stands alone. The enthusiasm with which Cicero, Strabo, Pliny and Pausanias speak of his colossal statues of *Jupiter* and *Minerva*, which he executed in ivory and gold, can best be learned by consulting those writers; but there is reason to believe that Phidias himself did not approve of the application of this material to works of art—at least, not to works of that size, however it may have suited the capricious taste of the Athenian people. In an assembly of the people he is said to have earnestly recommended a different substance for the statue of Minerva which was to be placed in her temple in the Acropolis, but on the Athenians being informed that it would be cheaper than ivory they rejected the proposal. Besides these two colossal statues in ivory and gold, we do not hear of above one or two more executed in these materials by the same artist. The far greater number of his statues, which are expressly mentioned by the ancient writers, are in bronze.

Phidias, however, did not disdain efforts of an humbler sort; for, not to dwell on his statues in wood, plaster and clay, nor on certain pieces of minute mechanism, as fish and flies, ascribed to the same master, he was the first who discovered the true principles of carving in relievo, and, in the smallest productions of his art he preserved, according to Pliny, the same grandeur of execution which characterised his greatest works. The same author mentions in terms of high praise the Lapithæ and Centaurs, carved on the sandals of Minerva, and the workmanship of her shield, on the convex side of which was represented the battle of the Amazons, and on the concave that of the gods and giants. The shield, moreover, contained a likeness of Pericles fighting with an Amazon, and was put together so artfully that if a figure of Phidias himself (representing him as an old bald man, holding up a large stone in his hands to denote his being the architect of the temple) were by any means removed the whole shield must inevitably have fallen to pieces.

The masters of the greatest eminence which the school of Phidias produced were Agoracritus, Alcamenes and Colotes. Of these Alcamenes was the most distinguished; he is mentioned by the ancients as an artist of the greatest merit. We praise, says Cicero, that Vulcan at Athens which Alcamenes made, in which, though standing and covered over with drapery, there is an appearance of lameness without deformity. Valerius Maximus gives a similar description of it at greater length. Pausanias makes mention of a beautiful Bacchus from the hands of this master in ivory and gold, and two colossal statues of Minerva and Hercules, erected at Thebes, of Pentelic marble. But the masterpiece of Alcamenes was the group of statues on the pediment of the back front of the temple of Jupiter at Olympia, the description of which, in the Eliacs of Pausanias, affords so many singular coincidences with the statues upon the pediments of the Parthenon at Athens, that it is scarcely possible to entertain a doubt that both were erected nearly at the same period. It is not improbable that Alcamenes had attempted to imitate the latter, encouraged by the success of his master Phidias in a similar undertaking. Of the same Alcamenes we read in Pliny that he was a statuary of the highest merit, that many of his works still adorned the temples and that he had produced the incomparable Venus without the walls.

Another of Phidias's scholars, his favourite pupil Agoracritus, is chiefly celebrated as connected with the famous statue of Nemesis, the *Goddess of Vengeance*, at Rhamnus, near Marathon, in memory of the result of that battle. The history of this statue and its allegorical accessories, one of the departments of the art peculiar to Phidias, are too well known to be repeated here. To this statue was appended a label stating that it was the work of Agoracritus, but all the ancient writers who mention it, and particularly Pausanias, speak of it as the work of Phidias, and it appears to have been one of the most extraordinary productions in marble sculpture which the art has ever produced. Among other marble statues attributed to Phidias were the *Mercury Pronaos* in the temple of Ismenian Apollo at Thebes; a beautiful *Venus*, in the Octavian Museum at Rome; the face, hands and feet of the *Minerva Bellica of the Platæans*, from the spoils at Marathon (the rest of the statue was of wood and gold); the *Venus Urania*, in Parian marble, in the temple of that goddess in Attica; one of the colossal statues on the Esquiline Hill. The inscription is of later date, and therefore, exclusive of the merit of the sculpture, carries with it no other testimony than that of the notoriety of Phidias as a sculptor in marble. In the Augustan age and in that immediately subsequent to it, it was generally believed not only that Phidias frequently caused the names of his pupils to be inscribed on his own statues, but that he had given instances of the greatest skill in finishing the works of other artists. Amongst these last was the above-mentioned statue of *Aphrodite* by Alcamenes. To this extraordinary talent, which we must suppose was chiefly exercised in works of marble, Cicero alludes.

With respect to the particular character of the sculpture of Phidias, we may gather from the language of the ancients respecting him that he had no competitor at least for posthumous fame—that his excellence in his own art became a proverbial term of comparison by which to illustrate that of all other persons whatsoever in their particular departments. As an elegant modern French writer has observed, "The sculptors who preceded Phidias could not divest their statues of a certain stiff and dry formality. Phidias was the first who gave to his style, according to the expressions of the ancients, grandeur, majesty, gravity, breadth and magnificence."

But words were inadequate to express with sufficient energy the admiration which the ancients felt for the style and character of the works of this celebrated artist. They compared them to the style of Thucydides and of Demosthenes. Yet the masculine beauty portrayed by the hand of Phidias was combined with sweetness, with elegance and with grace. Equally ingenious as he was sublime, he executed great works with energy; those the more inferior, with simplicity and truth. His style, which varied with his subject, was at the same time grand and refined. If Phidias had not applied all his powers to portray the slightest shades and the most delicate lines, he never would have reached that expression of life peculiarly his own. His style was truly admirable, because it "united the three characters of truth, grandeur and minute refinement."

Plutarch, in his life of Pericles, tells us that that munificent and enlightened patron of the arts appointed Phidias the sole director of all his public works. All the other artists, however eminent, received his orders. Of these, Callicrates and Ictinus were particularly employed upon the Parthenon. Phidias and Pericles, who seemed to live for each other's glory, and to combine their joint exertions in order to embellish Athens, were frequently the objects of jealousy to the Athenian people; and Phidias fell a victim to their animosity for attempting to give to his own name the immortality which it was not doubted would be the inheritance of his works.

Plutarch, in speaking of these works, describes them in the following terms. After observing in general that those which were slowly executed were likely to be the most durable, he adds:—"Hence we have the more reason to wonder that the structures raised by Pericles should be built so quickly, and yet built for ages; for as each of them, when finished, had the venerable air of antiquity, so even now they retain the strength and freshness of a modern building. A bloom is diffused over them which preserves their aspect untarnished by time, as if they were animated with a spirit of perpetual youth and unfading elegance."

HOUSES AND SHOPS, HEADINGLEY, NEAR LEEDS.

This block of buildings was recently erected from the designs of Mr. T. BUTLER WILSON, of Leeds and Harrogate.

AT STIRLING WITH THE "ARCHITECTS."

A LADY CORRESPONDENT, who accompanied the party of Dundee architects on Saturday, gives the following account of the journey in the *Dundee Advertiser* :—

My best apologies to the "Architects"! I should have said rather the Dundee Institute of Architecture, Science and Art, but the tendency of the age is in the direction of lopping off all superfluities of speech, and so the sonorous and mouth-filling title of the Association is generally discarded in favour of a briefer appellation. The Institute has become an important factor, not only in the professional but in the social life of the city, for, besides arranging a useful series of lectures during the winter at which technical subjects are discussed, it gets up capital conversaziones, and when summer-time comes round it has most enjoyable excursions. The first of these this year was a visit to Anstruther, Crail and other of the quaint burghs of the Fifeshire coast; the second and last took place on Saturday, when a party of members and friends visited Stirling. At all these functions the "Architects," ever mindful of that important branch of their profession which concerns itself with decoration, are used to invite the presence of ladies, and there was a goodly sprinkling of the superior sex in the company on Saturday, although the party was smaller than it might have been on account probably of the unsettled state of the weather. The weather, indeed, supplied a pleasant element of uncertainty to begin with, for though the sun shone out gallantly there were plenty of clouds to be seen, and no end of ominous whispers about prematurely bright mornings turning into rainy days, &c. The weather for once disappointed our fears, however, and behaved in the most charming way. Even the clouds which discomposed us at the outset added to the beauty of the fair landscapes through which we passed, their changing shadows chequering the hillsides with lovely effects of light and colour.

It was a beautiful route all the way, first beside the winding Tay rolling full-brimmed to the sea; beneath the shadow of stately Kinnoull Hill with its rich mantling of trees, and by the marshy backwater where "Chill October" was painted; and then by the "Bonnie Earn," which flows through its lovely pastoral landscape, with a glint of light here and there as it flows through Lady Nairne's poetry and her songs; alongside the Ochils, grassy to the summit and dappled by the passing cloud, on to Allan Water with its pathetic ballad memories; by fair Dunblane, whose ruined fane has been restored to a semblance of its former glories; and so on to Stirling town, perched upon its rock and overlooking the fair and fertile Carse of Forth.

We left the West Station at 8·20, and were in Stirling shortly before ten o'clock, after a wonderfully rapid and pleasant run. Arrived at Stirling, we were welcomed by a party of local gentlemen, who constituted themselves our guides in viewing the town—viz. Provost Yellowlees, Dean of Guild Millar, Treasurer Ronald and Mr. Walker, architect—and never had visitors better cicerones. The Provost, in particular, was an invaluable acquisition. A son of the Rock himself, he is thoroughly imbued with love of his ancient town, its antiquities and traditions, and led us from point to point of interest with unflagging enthusiasm, infused with humour and shrewd mother-wit.

The great thing to be seen was, of course, the Castle, and we made for it, noting many objects of interest by the way, the pious inscriptions on ancient houses, Darnley House, which was the nursery of James VI.; the Market Cross, with its quaint old coats-of-arms; and "Mar's Work," a town-house built by an Earl of Mar just after the Reformation, in the construction of which a great deal of discarded carving from ruined ecclesiastical buildings was employed. Popular feeling was against this sacrilege, and the Earl having, as the Provost put it, "the dangerous gift of verse," had this couplet cut on one of the stones :—

I pray all lvkaris on this lvging
With gentil e to gif mair ivging.

This pacific advice was not apparently taken, for next he wrote :—

The moir I stand on oppin hitht
My favltis moir svbject ar to sitht.

This candid confession did not disarm criticism, however, and the builder added a final couplet much in the style of the flouting motto, "They say; what say they? Let them say." The Earl did not live to inhabit the house, and it was never completed.

Another inscription in Baker Street deserves notice. It runs thus :—

Heir I forbear
My Name or Arms to Fix,
Least I or myne
Shd sell these stones and sticks.

The point of this lies in the fact that the next house has an elaborate coat-of-arms displayed on its front. Doubtless "the pride that apes humility" was not unknown in these olden days, though it must be admitted that the philosophic burgher scores now. Many people visit Stirling Castle on sight-seeing intent, but few have the opportunity of seeing it as we did. By the kind permission of Colonel Nightingale we were enabled to visit portions of the Castle not accessible to the ordinary tourist, and had a magnificent outlook from the most commanding points over fifty miles of country rich in historical associations. From the Queen's look-out—where V.R. and a date cut in the stone show that Her Majesty visited the spot on her first visit to Scotland in 1842—we gazed westwards over a scene of surpassing beauty. Nearest the eye were "the varied realms of fair Menteith," backed by the mountain peaks which sentinel the Trossachs. Beyond Ben Lomond's cloud-capped peak we could dimly discern the giant outlines of the more distant hills, the "Cobbler" at the head of Loch Long. From Queen Mary's look-out we looked down on the precipitous side of the Castle rock, and on the old royal gardens—on the site, too, where jousts and tourneys were held in the merry days of old beneath the eyes of the Queen of Beauty. And ascending to yet a greater altitude, by way of an apartment now used as officers' quarters, known as Queen Mary's room, we got out by a trap door on to a central tower from which a complete panoramic view was to be had, from the Lomond hills in the east, "baring their virgin bosoms to the sky," to the western horizon with its rocky ramparts, Bannockburn with its flagstaff glittering against the trees, the Abbey Craig crowned by its national memorial, and the winding links of Forth, where, according to the old belief, the river spells out its own name in its erratic curves, passing through land so fertile that it used to be said, "A link o' the Forth's worth an Earldom o' the North." All this we saw, and more—the grey old town nestling under the protecting shadow of the Castle, the soldiers at work or at play within its walls, but we had to hurry on to the many interesting things still awaiting us.

Passing through the cemetery, where there are a number of quaint inscriptions, many military memorials, and monuments to covenanting martyrs, including the Wigtown martyrs, we came to the indicator, an ingenious contrivance by means of which you can easily identify any outstanding feature of the surrounding country. On a dial set on a pedestal is painted a panoramic view of the landscape, the outline of the hills being carefully followed, and accompanied by names, &c., so that the visitor has only to consult it in order to get full information regarding what he is looking at. A more efficient way of teaching the geography of a district could not be imagined. From this, which is planted on a height in one corner of the cemetery, we passed to the city churches, where we were taken in hand by Treasurer Ronald, a learned and enthusiastic antiquarian, who traced the history of the buildings and detailed vicissitudes through which they had passed in the most interesting way. We visited the Guildhall, too, and here the Dean of Guild was good enough to show us the gold ring set with jewels which was presented by David of Scotland to a far-off predecessor in office, and which had been handed down for so many hundreds of years from dignitary to dignitary. It is a large circlet of bright yellow gold, probably intended to be worn on the thumb, and bears an inscription in quaint old Scotch. We looked in at the High School in passing, and went over Allan's School, admiring the arrangements of both. By this time we were not indisposed to turn in for lunch, sight-seeing being proverbially a hungry business. After giving this item due attention, we went to see the fine new Public Hall and the Smith Institute, where there is a collection of pictures by celebrated artists—John Philip, Sam Bough, M'Taggart, &c.—as well as a museum, reading-room, &c.

In the afternoon our principal excursion was to the Wallace Monument on the Abbey Craig, which was reached by tramcar to Causewayhead, whence a quarter of an hour's walk took us to the monument. Here again a noble prospect met the view far as eye could reach, the course of the Forth being visible for many a mile, until the river broadened out into the Firth. Unhappily, a haze hid the great Bridge and the hills to the east. The Hall of Heroes is now nearly furnished, only two busts being wanted to complete the circle. Knox and George Buchanan, Dr. Chalmers and Adam Smith, Scott and Burns, James Watt and Livingstone, Tannahill and Hugh Miller and Robert the Bruce are the representative Scotchmen whose effigies adorn the hall, a goodly list of geniuses of different moulds—poets, writers, divines, philosophers, inventors, travellers, headed by the patriot King of Scotland—whose names are worthy to be had in everlasting remembrance.

Many more interesting things were crowded into this most interesting day; but "time, who steals our years away, steals our pleasures too," and it was but all too soon when we found ourselves at the station again on the way for home. A lovely sunset with great stormy masses of cloud piled on the western horizon delighted our eyes as we rolled northwards, and we glided into Perth in the tender gloaming with the stars coming out in the darkening sky. Here we parted with our Blairgowrie contingent, and a rattling run of twenty-five minutes soon brought us to Dundee, where we separated with mutual felicitations on the splendid day's outing we had had, pleasant memories from kind Stirling friends who had done so much to make our visit a success, and blithe wishes for our next merry meeting.

LANDLORDS AND LEASES.

IN continuation of the letter published last week from Mr. C. Thorp, Mr. Sextus Dyball, F.S.I., writes to the editor of the *Times* :—

The stringent lines upon which leases are now drawn may account in a great measure for the weighty feeling of dissatisfaction that has sprung up between landlord and tenant, as expressed in the correspondence which has been proceeding in your columns on the subject of insanitary houses. During an experience of forty years as a surveyor, my practice has to a large extent lain in the assessment and settlement of claims for dilapidations—*e.g.* the amount payable by a tenant to his landlord on the expiration of a lease in respect of repairs which he (the tenant) has during his holding failed to execute in accordance with certain covenants in the lease. Consequently a considerable number of leases relating to all varieties of property pass annually through my hands, and I am becoming more and more struck with the increasing one-sidedness of the covenants in favour of the landlord. The equitable construction of the law of dilapidations is to guarantee the landlord against any injury committed or permitted by the tenant, whether by neglect or otherwise, beyond reasonable use and wear; and my experience is that landlords were formerly satisfied with a general covenant, on the part of the tenant, upon these lines. But latterly it has become the custom to introduce into repairing leases exceedingly stringent covenants in favour of the landlord, which, unless interpreted in an equitable spirit, may and notoriously do afford a pretext for great injustice and extortion. I have now before me a draft lease for a term of twenty-one years (determinable at the end of the fifth, seventh or fourteenth years) of a house and stable in the West-end, upon which I have been consulted by a proposed tenant, and from which—in support of my contention—I will give some extracts. After making the tenant liable to pay and discharge all rates, taxes, charges, duties, assessments and outgoings — Parliamentary, parochial or otherwise—now or hereafter charged upon or affecting the demised premises, or the landlord or tenant in respect thereof (except the landlord's property-tax), the covenants bind him (the tenant) during the term to keep, and at the end to surrender, the premises in good and substantial repair, order and condition, to paint the outside stucco and cement work, and to paint, grain and varnish all the external wood and ironwork within the last three months of the fourth, seventh, eleventh, fourteenth, eighteenth and twenty-first years of the term; and to paint, paper, colour, flat, grain, marble, gild, varnish, decorate and French polish the inside during the last three months of the fifth (if the lease be determined at the end of that year) or otherwise of the seventh, fourteenth and twenty-first year, the whole to be done in the best manner, in appropriate colours and patterns, the outside paint with not less than two coats, and the inside with not less than three coats. On writing to the landlord to the effect that I considered these covenants unreasonable at the rack-rental demanded—viz. 400*l.* per annum—and that I could not advise my client to agree to them, he replies :—"I cannot admit that the covenants of the proposed lease are unreasonable, seeing that I have over a hundred similar ones now in existence. . . . The terms, however, can be altered, if desired, and the rent increased to relieve the tenant of certain outgoings"—a suggestion which amounts to no more than a transfer of the liability, as it were, from one hand to the other. A tenant at rack-rent is entitled to the fair and reasonable use and occupation of the premises, and he should not be held liable to execute repairs beyond such as are necessary for the upholding and maintenance of the fabric or for the making good of damage occasioned by neglect or misuse on his own part. The liability of a tenant was originally never meant to extend to the work of purely decorative and ornamental character, which is now so generally called for under the specific covenants of leases, and it seems to me that, in a great measure, tenants have only themselves to thank for the addition. Of course, a lease, as soon as it is executed—no matter how stringent or exacting the covenants may be—constitutes a hard and fast contract, which, like the drains that were said to be all right, will in all probability—so far as the interest of the tenant is concerned—prove to be all wrong. At this season of the

year, when so many properties are changing hands and new leases are being drawn, it is of the utmost importance for tenants to protect themselves against such excessive liability as the draft lease from which I have quoted seeks to impose, and which, apart from the manifest unfairness of the covenants, might lead to serious legal complications, if, by reason of illness or other cause, the tenant were unfortunate enough to lay himself open to an action for breach of covenant in not having at the stipulated period performed the repairs specifically provided for.

Mr. A. Moore, F.S.I., writes:—The letter of your correspondent Mr. Dyball seems to be written entirely in the interest of the tenant, and I should hesitate as a landlord to entrust him with a claim for dilapidations, unless assured that he could view the business from the other side, and which, no doubt, he would do with the positions reversed. A bargain for a lease is a purely commercial transaction; repairing covenants are well understood and form part of the bargain. The leaseholder having all the advantages likely to accrue from the property increasing in value as time goes on, is it unreasonable that he shall take upon himself concurrent responsibilities? A tenant taking a repairing lease expects and exacts that the premises shall be handed to him in a perfect state of constructive and decorative repair, and it is the province of his surveyor to see that this is done. It is the work of his solicitor to see that the covenants are fair and in accordance with the preliminary agreement between the parties. Of course it may happen that a tenant accepts a repairing lease of a dilapidated property, but this is quite a matter of bargain, of which the amount of rental forms a part. It is my experience that leaseholders at the termination of their tenancies are quite as anxious to avoid as landlords are to exact performance of repairing covenants, and it frequently happens that a lessor is landed with a dilapidated property from a bankrupt and destructive tenant. The dictum of *caveat emptor* applies in this as in all other bargains.

Another F.S.I. says:—The statement made by Mr. Dyball that "latterly it has become the custom to introduce into repairing leases exceedingly stringent covenants in favour of the landlord," will cause much surprise to owners, surveyors, and others conversant with house property in London. The growing tendency of the age is to rebel against the very principle of repairing leases, and a more correct view of the situation appears to be this—that tenants are becoming more and more exacting in their requirements, insisting on the hundred and one decorative and other luxuries that science and art, goaded by competition, afford, and that landlords are struggling, with ever-increasing difficulty, to maintain house property as a source of income. Speaking generally, they are fighting, in fact, a losing battle. The dilapidation question is almost always settled by payment of a sum in lieu thereof, agreed upon by two surveyors, respectively representing the landlord and tenant. Whatever this sum may be—say, for example, 100*l.*—the grasping landlord usually finds that he has to expend 150*l.* or 200*l.* before he can again let his house on a repairing lease, with necessary loss of rent during the process of repairs. The principle governing dilapidations is a simple and just one. An equitable basis of rent having once been arrived at, the landlord asks the tenant to give him back his house in the same state as it is delivered over. Sometimes a tenant is content to accept his dwelling with little or no outlay, though, more or less, it needs repair. The landlord modifies his covenants to meet the case. If, on the other hand, it be demanded, *inter alia* (and this is much more usual), that the inside be painted, papered, coloured, flatted, grained, marbled, gilded, varnished, decorated and French polished, "Certainly," says the landlord, "but kindly return it to me in the same condition. The rental I have agreed to accept is calculated, as you must, or should, be aware, upon this understanding." Permit me to point out one fertile source of grievance and practical injustice to house occupiers, though they themselves are to blame. Frequently, from sheer ignorance of their liabilities, they sign leases without giving any heed to essential conditions of the structure they are about to occupy. Thus, quite recently, it was sought to make a yearly tenant, terminating his holding in less than two years, responsible for extensive settlements and crackings of party and other walls, and repointing of hundreds of feet of terrace brickwork, the slow result of a quarter of a century's neglect. This condition of things can be most easily obviated. A "schedule of defects," prepared by a competent surveyor, should form an integral part of every lease or agreement. This simple process would cost tenants less in shillings than it now frequently does in pounds sterling.

H. T. P. says:—Mr. Sextus Dyball inveighs against the repairing covenants in modern leases; at the same time he does not relish the idea of increased rent and weak covenants. What does he want a landlord to do? Does he want him to let his house at less than the market value? Why should a landlord be debarred from the right, common to all men, of getting the utmost price for parting with property—the landlord parts with it for a term, at all events? I relet a house in November 1888, at 200*l.* per annum for four years and 225*l.* per annum for three years more, which when I bought it in 1881 was let at 275*l.* per annum, although only estimated to be worth 265*l.* I gave 4,400*l.* for it leasehold for 69 years at 2*l.* per annum. In repairing it and redraining it I spent on contractors 905*l.*, besides professional expenses. Though the house is let on repairing lease, my return from a wasting interest is not enormous. Surely some good fairy in the shape of a landlord's edition of Mr. Dyball should step in and induce my tenant, notwithstanding the lease, to pay me a rent which shall be a fair return on my capital, or else I ought in good times to have the right of getting the utmost I can for my property. I ought to add that the original lessee on determining his lease paid me 250*l.* as dilapidations and four months' rent beyond the date at which he gave me up possession. By all means let tenants kick at strong covenants in draft leases, but just as landlords find that competition regulates the market, the tenants will discover that the landlord will get his market value, whether with moderate rent and strong covenants or an increased rent and weak covenants, and that notwithstanding Mr. Dyball.

THE LATE SIR JOHN STEELL, R.S.A.

WITHIN a few weeks after the death of Sir William Fettes Douglas, the Royal Scottish Academy has to mourn, says the *Scotsman*, the loss of another of its most distinguished members. At the ripe age of eighty-six, Sir John Steell, sculptor to Her Majesty for Scotland, has passed away, leaving behind him the record of a life-work of great achievements in the domain of art which entitles him to the esteem and admiration of every patriotic Scotsman. For the past ten or twelve years he has lived in complete retirement, and latterly his health has broken down so seriously that he was confined almost entirely to bed. But his mind was healthful and vigorous to the last; and though the infirmities of age had reduced and weakened his bodily frame, his intellectual activity remained unimpaired till within a very few hours of his death, which occurred between six and seven o'clock on the morning of the 15th inst. By his removal Scotland has lost an artist of whom she had just reason to be proud, not only because of his acknowledged talent, but also on account of the devotion he showed for his native country, when he withstood all the inducements which the larger opportunities of winning fame and fortune in London held out to him.

Born in Aberdeen in 1804, the son of a carver and gilder, Steell owed much of his later success in life to the assiduous care and promptings of his father. He was no more than a year old when his family removed to Edinburgh, and there his taste for art was cultivated in boyhood, and was displayed in designs which astonished all who saw them. Of this early evinced taste a schoolfellow—Judge Anderson—wrote from the West Indies when Steell was distinguished in the world of art:—"From contemporary circumstances, and comparing notes of our ages, it must have been about the year 1812, when you were about eight and I about ten years of age, we and your sisters used to play children's games together, our parents' houses being on the steep road ascending to the Calton Hill. You were a delicate-looking, gentle-spirited little fellow, and wore a little round jacket. The 'plainstanes' or foot-pavement was, as usual then with boys, a favourite place of amusement with our spinning-tops. I remember one day when you greatly surprised me by drawing with a piece of chalk (by what appeared to me two or three strokes dashed off without the least apparent trouble) a figure of a galloping horse of a large size, so entirely different from and exceeding in point of character and excellence anything that children ever did that it greatly impressed me then, and I never afterwards forgot it. When from time to time I saw your name and the important works you had been called upon to execute, I always thought of the picture of the horse on the 'plainstanes.'" Failing to obtain in Scotland the art education he sought, Steell spent several years studying at Rome, where he made many designs—some of which he afterwards matured and executed—and where high encomiums were lavished on his work by his Italian friends and masters. He returned to Scotland in 1833, and established a studio in Edinburgh, where shortly afterwards he executed a group of *Alexander taming Bucephalus*, which at once brought him into public notice, and procured for him a special award of 50*l.* from the Board of Manufactures, by the members of which the design was greatly admired. The group was reproduced times without number, and Steell was permitted the rare honour of exhibiting his work for six weeks in the galleries of the Board. Sir Francis Chantrey was so struck with the group that he urged Mr. Steell to remove his studio at once to London, where he assured him of success and promised him personal aid. Largely from a desire to devote himself to the promotion and improvement of art in his native country, these inducements were resisted, a circumstance all the more to be admired when it is remembered that several prominent Scottish artists on

account of the favourable reception accorded to their works, had removed to the metropolis about this time.

The fame of his *Alexander and Bucephalus* group led to a commission for a colossal statue of the Queen, which now adorns the front of the Royal Institution. Another high honour was awarded him. After the death of Sir Walter Scott, in the competition for his monument the design of Mr. Steell for the statue was at first unanimously approved, and after much stormy altercation on the part of Chantrey and others selected by the committee to occupy the pedestal covered by the monument designed by Kemp. This was the first marble statue commissioned to be executed in Scotland, though a statue of Provost Blaikie for Aberdeen, subsequently ordered from Mr. Steell, was the first finished. Among the pamphlets published in connection with the Scott Monument discussion was a letter by Dr. Memes, the biographer of Canova, and author of a treatise on painting, sculpture and architecture, &c., and at its close, speaking of Mr. Steell, he says :—"I have made the history and the principles of art the study of many years. This has led me to converse much with artists, and a deeper and nobler enthusiasm than yours, a more simple or manlier perception of art, a more steady or sincere devotion in the pursuit of excellence, it has never been my chance to meet." This is high praise from one learned and deferred to on the subject of art. After the statue of Scott, other important commissions quickly followed—among others that of the colossal equestrian statue of the Duke of Wellington in front of the Register House, for which he received sittings at Walmer Castle, the Iron Duke even mounting his charger that the sculptor might more accurately represent his seat in the saddle. A bust was modelled for the group, and so highly pleased was the Duke with it that he ordered two copies for himself. Describing the unveiling ceremony on June 21, 1852, Lord Cockburn in his Memorials writes :—"The ceremony was striking, from the masses of people perched on all our pinnacles, horse and foot soldiers, of whom the most interesting was a band of Waterloo pensioners ; sundry processing bodies, chiefly those grotesque masons, and various lady-filled scaffolds. The cheers when the canvas dropped and disclosed the statue—running from the near to the distant streets, and ascending to the summit of the Calton, to the top of Scott's monument, to the tower of St. Giles, and prolonged on innumerable picturesque heights—were very fine ; and before they had ceased the guns of the castle roared ; and scarcely had they done their best when the inspired thunder rolled also, and left us to disperse in silence and under a short torrent of rain. Some think that it is more a statue of a horse than of a man—a great mistake, but not an unnatural one, from the man being only visible above the horse in high action. I went twice to see it next day, and of all the groups of gazers I scarcely observed one person talking to his neighbours. This silence was the deepest homage. It is certainly a noble work. Is there a better modern statue of the heroic order in Europe? We are all proud of Steell, a son of Edinburgh."

Steell's principal work, however, is acknowledged to be the national memorial to the Prince Consort, which occupies a conspicuous position in the centre of Charlotte Square Gardens. The inauguration of this statue by Her Majesty the Queen, in August 1876, excited the greatest enthusiasm throughout the country, the sculptor on the evening of the ceremony receiving the honour of knighthood in Holyrood Palace. Among other notable statues which came from his studio may be mentioned those of Lord de Saumarez, commissioned by Sir Robert Peel for Greenwich Hospital ; of Lord Jeffrey, Lord Melville, Lord President Boyle, Professor Wilson (Christopher North), Allan Ramsay, the poet ; George Kinloch, of Dundee ; the Earl of Shrewsbury and Dr. Chalmers. A bust of Dr. Chalmers, executed by Steell, called forth the following eulogy from Dr. Brown :—"Steell's is a noble bust—has a stern, heroic expression and pathetic beauty about it, and from wanting colour and shadow and the eyes, it relies upon a certain simplicity and grandeur ; in this it completely succeeds—the mouth is handled with extraordinary subtlety and sweetness, and the hair hangs over that huge brow like a glorious cloud. We think this head of Dr. Chalmers the artist's greatest bust." Steell also executed busts of the Queen, the Prince of Wales, the Duke of Edinburgh, Sir Robert Peel, De Quincey (the "Opium Eater"), of Florence Nightingale, Professor Edward Forbes, the naturalist; Professor Jamieson, Lady Susan Bourke, Lord Cockburn, Lord Fullerton, Lord Colonsay, Sir John and Lady Emma Macneil, David Scott, the painter ; the Marchioness of Lothian, the Duchess of Buccleuch, Lady Stirling Maxwell, Dr. Guthrie and many others. He has also executed statues of Lord Dalhousie and James Wilson, the financier, for Calcutta ; of Lady Elgin, for Jamaica ; and a colossal statue of Burns for New York, for which city he also executed a replica of Sir Walter Scott. A large number of the busts of eminent lawyers, which adorn the Parliament Hall, have come from Sir John's studio, as have also many monumental works, among which may be particularised those to the memory of the 42nd Highlanders erected in Dunkeld Cathedral, to the 93rd in Glasgow Cathedral, to the 78th in St. Giles and to the 4th in Carlisle ; to Lord Balgonie, Dr. Alison, the author of the "Essay on Taste" ; and to the Duke of Athole at Blair. The figures over the Standard Assurance Office, illustrating the parable of the ten virgins—repeated and enlarged for the office in Dublin—and those in the large tympanum of the Bank at Montreal, descriptive of the history of commerce, were executed by him. Sir John, who was a member of the Royal Scottish Academy from 1830, joined the body in that year from the Royal Institution, with which he was originally associated. Some time later he was appointed sculptor to the Queen for Scotland, and was elected to the Board of Manufactures, of which he was the oldest member. He introduced bronze-casting into Scotland, building at great expense a foundry of his own, which he made available for casting the works of other artists. A few years ago his studio was sold, but he did not altogether relinquish work. With the exception, however, of the bust of a lady in marble, shown at the annual exhibition of the Royal Scottish Academy in 1889, he has done nothing for the past ten years which has reached the public. Latterly he was in receipt of a grant of 100*l.* per annum from the Civil Pension List. Sir John was one of the most amiable of men, and one of the most genial of companions. His manner was that of a fine old gentleman who would scorn to do anything that might wound the feelings of those with whom he came in contact. His considerateness in this respect might almost be said at times to have become a weakness. It seemed as if he wanted the courage to refuse to comply with requests that were certainly not for his personal advantage, and it may be that now and then this easiness of disposition was abused, but, none the less, it endeared him greatly to all those who had the good fortune to make his acquaintance. His friends were numerous, and he deserved the friendships he enjoyed.

Sir John, whose wife predeceased him by several years, leaves two sons and a daughter. One of his sons is a consulting physician in Manchester, and the other an architect in Edinburgh. Mr. Gourlay Steell, R.S.A., animal painter to Her Majesty for Scotland, is a brother of the deceased.

THE CHICAGO EXHIBITION.

AT the opening of the National Columbian Commission on the 4th inst. a communication from President Baker, of the local World's Fair Corporation, asking the co-operation of the National Commission in securing a loan of 5,000,000 dols. from the Government for the use of the fair, to be repaid out of the first receipts, and a resolution of the Executive Committee of the Commission endorsing the request, were read and referred to the Committee on Judiciary.

Commissioner Towsley, of Minnesota, presented a resolution to the effect that the resolution heretofore passed for the appointment of a committee to recommend certain modifications of the tariff law in the interests of the exposition, be reconsidered and expunged from the minutes. Mr. Towsley said that rules of the Treasury Department provided for the whole work which it was proposed for the committee to do in the matter of the admission of goods intended for exhibition at the fair. This action of the Commission, he said, was liable to misconstruction ; it had been publicly misconstrued as an attack by the Commission on the new tariff law. Furthermore, it would put the Commission at odds with Congress, and would interfere with its work in securing the proposed 5,000,000 dols. loan for the fair.

Commissioner Harris, of Virginia, the author of the resolution which it was proposed to rescind, said the resolution was not aimed at the new tariff law ; it would apply alike to the old tariff law or to the mills had it become a law. The resolution was entirely non-political ; its object was merely to relieve foreign exhibitors of unjust burdens.

After a long discussion the resolution for the appointment of a committee was reconsidered by a vote of 32 yeas to 23 nays, and it was referred to the Committee on Legislation after Commissioner Waller, of Connecticut, had made a speech deprecating the political turn which the matter had taken in the public press and in the Commission. He declared that no politics was thought of when the resolution was passed, and said that when the Democrats got ready to fight the new Tariff Law it would be done openly, not under cover of an insignificant resolution.

A resolution pledging the Commission to take up and consider the Sunday closing question as soon as it should properly come before that body was unanimously passed.

The Auditing Committee presented its report, showing an estimated excess of expenses by the Commission for the year ending July 1 next over the appropriation of 23,000 dols. In order to avoid this the committee recommended that the April meeting of Commission be postponed till July ; that the pay-roll of director-general be reduced by 3,000 dols. ; that the salaries of 5,000 dols. each of the president of the Commission and the vice-chairman of the Executive Committee be discontinued after October 1.

Vice-Chairman McKenzie, of Kentucky, said that the report seemed to be aimed at him in order to eliminate him from the Commission. This was unnecessary, as in his own good time he would eliminate himself. The whole trouble was that he had refused to sanction a report of the Finance Committee which he had not had an opportunity to see.

LINCOLN MUNICIPAL BUILDINGS.

AT last week's meeting of the Lincoln Council the subject of new civic buildings on the site acquired for the purpose was again discussed. It was proposed to advertise for plans from architects, the competition to be an open one, and sketch plans to be in the first instance furnished, also to select from such competition say three sets of plans, the same to be submitted to the whole Council in committee. An architect, as assessor, to be appointed in the first instance, his name being announced in the advertisement, and the above and other details to be submitted to him for approval before the same were acted upon. The following amendment was proposed:—"Before finally committing the Council to the Silver Street site, plans to be obtained for municipal offices, police, fire brigade, weights and measures, on the Sessions House site, in addition to the plans for the buildings on the Silver Street site, together with estimates of the cost of the whole scheme and of such portions of the scheme as are now absolutely required." A discussion followed, in the course of which one councillor said the Sessions House site had been before the Council on many occasions, and been rejected, and the Silver Street site had been approved. The minority ought to let the thing go forward. As for the suggestion that two sets of plans should be prepared when only one scheme would finally be accepted, it seemed to him that the impression must be that architects kept their offices open for the public good, and had nothing to do but prepare plans for any amount of buildings which would never be required. They would not get good architects to compete under such terms unless they offered them each a sufficient sum of money for the plans. Otherwise they would not send in plans for a building which would not be erected, and upon which there would be no chance of the successful competitor receiving the usual commission. He had before suggested that the Sessions House site was a magnificent one for schools and a free library and a museum, and they might also have reception-rooms for the Mayor in connection with any such buildings that might be erected there. The amendment was carried by a majority of one vote.

MONT ST. MICHEL.

"SWITZERLAND is fly-blown!" said one of our famous preachers the other day. What scornful epigram would he not swing at Mont St. Michel? From the arched lime avenue at Avranches, says a correspondent of the *Manchester Guardian*, the stranger sees its dark peak jutting out romantically from yellow sands, but as he draws nearer to the place his most vivid impression is of the hotel tout. A rabble of screaming women assail him at the very gate of the town, and he feels threatened like Pantheus by these advertising Bacchanals. The mediæval town lies huddled between the ruddy bastion of the outer wall and the steep face of naked rock. Its one crooked street, which climbs painfully along the escarpment of the lower cliff, is gay with the cheap frippery of a seaside bazaar. Mendicants display mutilated extremities to catch the *sous* of the tender-hearted tripper. "At the sign of the renowned omelette" stands the clever, buxom hostess, the Seiler of Mont St. Michel, her house adorned with the sketches of a hundred artists who have been her guests. High up the rock, house above house flaunts its connection with the hotel below, and angry placards guard you against fraudulent impersonations of the famous innkeeper. But the traveller hardly needs the warning. For him Mont St. Michel has but one inn and one hostess. "Quis ut Deus?" was the legend emblazoned on the banner of the mediæval pilgrim to St. Michel's shrine. But the motto of the modern tourist runs—"Quis ut Madame Poulard?"

You ascend the narrow ramparts, and catch the sharp salt smell of the nets spread along the battlements by the shaggy, barefooted fisher-folk. At your feet are the crowded purlieus of the town; above you rises the great mass of building, crested with flying buttresses and jutting pinnacles. The precipitous walls rise sheer from the town, but are fringed at their seaward base with ash, ivy and poplar growing down to the roots of the reddish rock, which is stained with black and yellow lichen. On inaccessible fragments of ruin flowers the wild-pink. To seaward, as far as eye can reach, you are ringed round with leagues of grey sand, white with a distant drift of gulls. Across the heavy sands a tiny cart crawls like a black fly, its horses splashing through the shallows. Suddenly the yeasty current of the tide coils in from the azure strip of sea on the horizon and quickly covers the nearer flats with a rippling wash of muddy water, while the birch-capped beacons sharply mark the treacherous channel and the deeper stream. Monastery, centre of knighthood, State prison, common gaol—the massive pile of masonry begins once again, almost against your will, to impress you by its ancient associations of faith, chivalry and crime. You find yourself forgetting the tripper, though his strident gabble is still resonant in the galleries above, and the chaffering of the trinket sellers rises from the steep street below. For them, at any rate, articles of faith seem less profitable than *articles de Paris*. The stream of trippers carries you forward to the grim entrance of the castle, and up through its sombre courts and vaulted corridors you climb to the dizzy level on which stands the ancient nave of the Benedictine church, perched on the very apex of the rock and red with repeated fires. As the custodian reels off his recitative, standing in the granite apse, which rests on twenty columns concealed in the crypt below, two amorous trippers scribble their names on an inviting door. Still higher the merry crowd hurries up the winding stair, and shouts with glee as it troops out on the highest platform, peaked with granite pinnacles, which in winter storms the wind snaps off like the icing of a bride's cake. Here you would fain linger with the world spread at your feet, but the trippers hurry you forward through the cloister, of Sicilian elegance but disfigured by a crude roof of new zigzag tiling. Poking its carving with their parasols, the trippers press into the dormitory, matchless in its spacious beauty, down again into the pilgrims' dining-hall and the chamber of knights, down still further to the vast cellars which form the base of the stupendous pile, built, like the great church of Assisi, in the age of faith, and justly honoured as "the marvel of its time." The "wonder of the thirteenth century" has become the museum and raree show of our own.

Still further down into the rock the crowd hurries to see the dismal dungeons. In one dark cell, three paces by two, its only air-hole an iron grid opening on a vaulted passage, the manacles still remain and clank as the adventurous tripper tries their weight. The cigarette of a French cyclist, wearing the jockey cap of his sport, and the bird's-eye of a British tourist mix an ironical perfume with the stuffy air of these dreary prisons. But even the holiday crowd stands horror-struck before the shallow arch in which once stood the cramped iron cage of the journalist condemned by Louis XIV. to crouch there in expiation of some affront. In the growing dusk the mildewed walls look grisly and grim, and on our leaving the castle we find that the night has fallen. The town is hushed. The last car rumbles off along the new breakwater with its burden for the train. In the dark mass of masonry above us one little window alone is ruddy with some custodian's fire. Far below, lanterns carried along the ramparts fitfully light up the battlements. The spell of the place falls on all who remain. At nightfall the thirteenth-century triumphs once again over the tripper in La Manche even as in Umbria. For Mont St. Michel, in spite of its touch of Blackpool, is still the Assisi of Northern Europe.

Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

THE SKEW BRIDGE AT RIMINI.

IT is generally supposed that oblique or skew arches originated in the necessity of carrying railways across public and private roads, rivers, &c., which could not be diverted. The bridge constructed in 1830 over the Gaunless river in the North of England is considered to be one of the early examples. Readers of Vasari's "Lives" will, however, remember that in the account of Niccolò, known as Tribolo, the son of the carpenter Raffaelo, of Florence, a description is given of a skew bridge which was one among many remarkable works of that ingenious architect. The passage is thus translated in Bohn's edition:—"The Signor Duke (Cosimo de' Medici) caused Tribolo to build a bridge over the Magnone, at a short distance without the Gate of San Gallo, where that river crosses the high road which leads to Bologna, and the arch of this bridge, seeing that the river crosses the road in a diagonal line, Tribolo constructed in a similar direction, which was then a new thing and was much commended (*che fu cosa nuova e molto lodata*). The masonry of the stone arch was more particularly praised, being all worked in pieces, each piece having the proper degree of inclination from the square in every direction, and all were so admirably conformed that the bridge has proved to be a structure of great force, and has moreover a very

graceful aspect; this bridge is, in short, an exceedingly beautiful work."

In Italy an example of a still earlier oblique bridge could be seen by Tribolo in the sixteenth century, viz. the ancient Roman bridge over the Marecchia at Rimini. Tomaso Tamanza, long known as architect and engineer to the Venetian Republic, was sent about 1740 to report on this work, which must have been erected about the commencement of the first century. The inscriptions suggest the period to which the bridge belongs :—

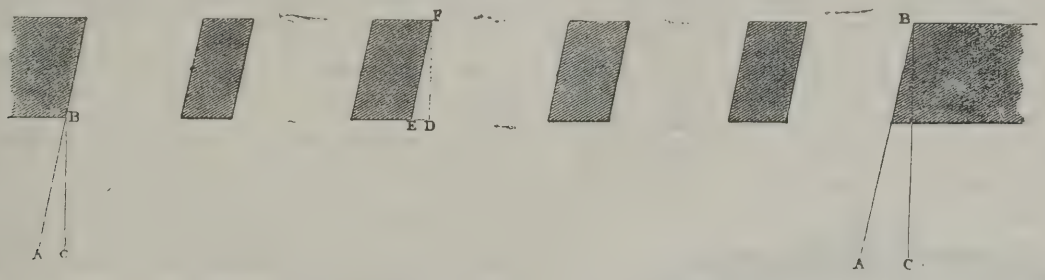
IMP. CAESAR. DIVI. F. AVGVSTVS. PONTIFEX. MAXIM. COS. XIII. IMP. XX.
TRIBVNIC. POTESTAT. XXXVII. P. P.
DEDERE.

TI. CAESAR. DIVI. AVGVSTI. F. DIVI. IVLI. N. AVGVST. PONTIF. MAXIM.
COS. IV. IMP. VIII. TRIB. POTEST. XXII.

In the course of his description Temanza says, "The river Marecchia passes under the bridge by five large arches, and by a straight channel of a width about equal to the length of the bridge empties itself into the sea," at that time about one Italian mile from the bridge. "This channel makes almost a right angle in the direction of the lines B C on the plan with the line of the external face of the bridge next the seashore, and serves as a harbour, but only for very small vessels. . . . The mouth is inclined to the left, and there is on the other side a great bank of sand which is daily and visibly increasing. . . . Neither side of the piers makes a right angle with the external faces of the bridge, but is inclined in the direction of the lines B A towards Rimini, that is to the right, which according to my belief was done for some very sufficient reason."

Rimini stands on the right bank of the Marecchia, and there is on the left bank, just beyond the bridge, a suburb of some extent called Borgo San Guiliano, and formerly Borgo dei SS. Pietro e Paulo. The dimensions of the arches and piers, beginning from the left bank, are, in English feet and decimal parts, as follows :—

	Feet.		Feet.
First arch .	28·323	First pier .	13·229
Second do. .	28·829	Second do. .	14·509
Third, or centre .	34·329	Third do. .	14·446
Fourth do. .	29·018	Fourth do. .	13·434
Fifth do. .	26·031		



The distance D E, showing the inclination of the centre pier—and Temanza makes all alike—measures 4·781 feet, and the bridge from face to face, D F, 24·150 feet. The angles therefore of the sides of the piers with the faces of the bridge, instead of being 90°, are less than 79°, being 78° 48′ nearly. In the table the measures are calculated in English feet and decimal parts, taking the Venetian foot as equal to 1·138 English foot, the mean of two authorities I have referred to for the proportion.

Temanza continues :—"It will certainly not be easy to assign the true motive for this obliquity, neither, on the other hand, will it be difficult to say something on the point. No one can doubt that the piers of the bridge were inclined in the direction in which the Marecchia ran. It follows that it must be believed that the mouth of the river was in the direction of the piers; that is, towards the city. And, indeed, in the careful search that I made for proofs I was informed by Signor Giovanni Bianchi, professor of medicine in Rimini, who is well known in the republic of letters, that in some very ancient charters of the monastery of San Guiliano, the ancient bed of the river is often named as the boundary of property, a clear proof that it had formerly another direction."

On the motive for making the piers oblique, it may be added to the above that in a work published in Rome in 1768, without the author's name, under the title "Del Porto di Rimini: Lettera da un Riminese ad un Amico in Roma," giving an account of some operations then lately carried on for the improvement of the port, the first plate, being a plan of the river from just above the bridge to the sea, shows the direction of the river above, so far as it is given, to agree with that below, except that there is an elbow on the left bank immediately above the bridge, the river there taking a sudden turn towards the right, and so making the course of the stream at the bridge in the direction of the waterway under it. Unfortunately, the work relates entirely to the port, and there is, therefore, very little of the river above the bridge shown.

Temanza proceeds to point out various inaccuracies in Palladio's very brief description of the bridge, particularly in not showing the inclination of the piers, and in representing the three middle arches as equal, they being equal in height only, which, measured from the chord of the arch, is 18·302 English feet (Ven. feet 16 1′), and that of the other two 16·967 English feet (Ven. feet 14 10′ 11″), and he further observes that, in his own time, the bridge was visible only from the chord of the centre arch, everything below being buried in gravel.

"The wedges, or voussoirs, of the three middle arches are not less than Ven. feet 3 5′ high (English feet 3·888), and those of the two extreme arches, Ven. feet 2 7′ (English 2·939); they are single pieces of stone, much longer than they are high, . . . and throughout the vault as high as the external wedges. No wedge can weigh less than a thousand pounds, and many weigh two or three thousand pounds each. The art with which they are joined is admirable; their interior faces are exquisitely smoothed, and I observed that the workmen had taken much more care in working the interior parts than in smoothing the exterior. They fit each other so exactly that a hair could not pass between them. . . . Many of them are split, and many others have holes in them. In the former appear those iron bolts or nails used by the ancients to unite great stones; these are well covered with lead, but many have been badly provided with this protection, and so the rust occasioned by moisture, which will make its way through the closest joinings, has produced the mischief of these splittings. . . . Each wedge has three bolts or nails, one corresponding to the angle formed by the two external faces, and the other two are over the two ends of the same." ("Uno corrispondente all' angolo formato delle due faccie esterne, e gli altri due sono sopra l'una e l'altra estremità delle stesse.") "The interior parts are wholly without this fastening as having no need of it."

It may be asked how it has happened that the obliquity of the bridge has attracted and received so little notice; an answer will be found in the following passage :—"That on the side next the sea, which has the more handsome elevation, was so placed that it corresponded in just symmetry with the centre arch which was under it; not so, however, that on the other side next the mountain, for, by reason of the oblique direction of the piers and arches, it is out of just symmetry with the arch below, and is nearer to Rimini. This was done with excellent design that the two inscriptions should appear on the road over the bridge directly opposite to each other, and that thus the traveller should not discover the obliquity of the piers." The inscriptions are engraved on each side of the bridge, on the inner side of the parapet on portions of it raised above and projecting into the footways beyond the general lines, such portions being about 38 feet long, and placed opposite to each other. This design has succeeded, but it may perhaps be questionable whether other circumstances may not have contributed to cause the peculiarity of construction to escape notice.

The Arch of Triumph at Rimini has secured far more attention from travellers than the bridge over the river, and on that account it may not be amiss to notice so interesting an example of construction.

ELECTRIC LIGHTING OF LIVERPOOL DOCK WAREHOUSES.

THE Mersey Docks and Harbour Board has not shown itself remiss, says the *Liverpool Journal of Commerce*, in sanctioning schemes for the improvement of the efficiency of the docks. Within quite a recent period we have seen docks which were regarded as almost useless filled with vessels of the largest class, and the adjoining warehouses, which seemed destined to become mementoes, and expensive ones at that, of the method of handling freight of a bygone generation, have, under altered circumstances, assumed all their original importance, and are now filled with goods and serving the purposes for which they were

constructed. Among other imports, which, like cotton, are almost peculiar to Liverpool, is grain, and to accommodate this very important trade the Waterloo Grain Warehouses were erected some years ago. Although the methods of dealing with vast quantities of grain have naturally improved since then, these warehouses are still among the finest to be seen anywhere. Machinery, comprising elevators of the most approved type, has been erected, and while, we believe, steamers of the largest size cannot use the Waterloo Dock, yet sailing-ships and large cargo steamers can have their cargoes of 2,000 to 4,000 tons discharged in a very short time. Up to the present time work at the warehouses at night time has always been of an unsatisfactory character, owing to the absence of light. Exposed flames, such as gas-jets, in a warehouse used for grain are out of the question, as the grain dust, as distinguished from the earthy matter in the form of dust, which is the usual accompaniment of bulk grain, is very inflammable, and in fact behaves like fine coal dust, in that it is easily oxidised under proper conditions. Flexible tubes for conveying gas were also obviously objectionable. Consequently, when it has been necessary to work at night time, vegetable oil lamps enclosed in glass frames have been employed. Those who have had experience in stowing grain in bulk in a ship's hold will be able to form an idea of the amount of light which is obtained by these means, especially when the air is filled with floating grain dust. An ordinary oil lamp, when properly looked after, may yield about six or eight candle power. After a few hours this falls to four or five; interpose a medium of grain dust between the observer and the lamp, and the light emitted is reduced to almost nothing. All this, however, is now changed at the Waterloo Grain Warehouses, and a departure has been made which will doubtless be followed up. The electric light has been introduced, and from an inspection we should say that it will not only greatly facilitate the handling of grain, but will also conduce to the comfort of the workmen. The Waterloo Grain Warehouses consist of three blocks of buildings of the most massive possible construction, resembling somewhat in their solidity and proportions the works of the old Romans. This is, however, a well-known feature of the work of Mr. G. F. Lyster, the Dock Board engineer. Two blocks are 650 feet by 80 feet, and the third 180 feet by 80 feet. All have six floors; consequently the total floor area is nearly 80,000 square yards.

Correspondence

University College Classes.

SIR,—I shall be glad if you will permit me to draw the attention of your readers to the announcement which they will find in your advertising columns of new classes which it is proposed to open, with a view to improving and extending the instruction in architecture and in building construction in this college.

The liberality of the Carpenters' Company has provided funds which are to be appropriated to establishing an afternoon class for architectural and structural drawing and an evening class (also chiefly a drawing class) for instruction in building construction. The fees of both are to be very moderate, and each is to meet twice a week. A very competent demonstrator has undertaken the conduct of the classes under my personal supervision, with the assistance of Mr. Elsey Smith.

I hope that some architects who take pupils will arrange to send them to the afternoon class. One object proposed is to assist students in preparing the drawings required as "testimonies of study" for the Institute examination, and otherwise to prepare them for examination. The work, as far as practicable, will, however, take up the subjects dealt with in my courses of lectures in architecture and construction.

It has been arranged that students able to devote a session to the preparation desirable before entering the architectural profession can attend the classes most suitable for this purpose as a series, and can obtain a "composition ticket" at a reduced fee, admitting to the whole of them.

T. ROGER SMITH (Professor).

University College, London: September 22, 1891.

A. A. Education Scheme.

SIR,—Enclosed is a copy of a letter which I am sending to the President and Committee of the A. A., and which speaks for itself. If you would kindly publish it I should feel obliged.—Yours, &c.,

G. A. T. MIDDLETON.

42 Bolingbroke Grove, Wandsworth Common:
September 22, 1891.

To the President and Committee of the Architectural Association.

Gentlemen,—It has come to my knowledge that in one at least of the subjects of the A. A. Education Scheme a gentleman has been appointed instructor who was not one of the applicants, myself and any others who applied in accordance with the instructions issued by you being passed over without being either interviewed or informed as to your decision. I have no objection to make to the gentleman appointed, he being a personal friend of mine and a capable instructor; but I do protest against the manner of his appointment, as an act of injustice to myself and all others who applied in the regular way, and should be glad of an explanation. I am sending copies of this letter to the building papers.—Yours truly,

(Signed) G. A. T. MIDDLETON.

September 22, 1891.

GENERAL.

Monday, October 5, has been appointed for the reception of works of art intended for the autumn exhibition (the twenty-fifth) of the Nineteenth Century Art Society, at the Conduit Street Galleries.

The Private Collections of Rome contain the following number of works of art:—Borghese, 676; Barberini, 99; Colonna, 600; Corsini, 647; Doria, 793; Rospigliose, 124; Spada, 312; Villa Albani, 73 pictures and 1,042 pieces of sculpture; Villa Borghese, 422. The Farnesina Collection has not been properly counted.

Sir James Kitson has presented to the Art Gallery of Leeds Sir Frederick Leighton's picture, *The Return of Persephone.*

The Historical Art Museum in Vienna will be opened by the Emperor of Austria next month. It will contain collections that hitherto were scattered through the city.

Mr. Hamo Thornycroft's statue of John Bright, M.P., will be unveiled in Rochdale on October 24. It is 9 feet 6 inches high, and will be placed opposite the Town Hall. The sculptor proposed to show the orator trampling on a sword, but the committee objected.

An Exhibition of works by members of the Association of Artists belonging to Lorraine will be opened in Nancy on October 15.

Mr. William Morris will deliver an address at the opening of the exhibition of pre-Raphaelite and other paintings at the Corporation Art Gallery, Birmingham.

The Japanese Government will, it is said, spend a sum of 140,000*l.* in preparation for a display of Japanese work at the World's Fair at Chicago; 30,000*l.* will be on account of Government exhibits.

The Council of the Glasgow Institute of the Fine Arts contemplate holding in their galleries during November a select exhibition of art-work by amateurs, including painting, sculpture, wood-carving, embroidery, &c.

The Agent-General for Tasmania announces that artists wishing to show their pictures at the coming exhibition, which will be opened on November 25, must see that their works be delivered to the London agents, Messrs. Dicksee & Co., Rose and Crown Yard, King Street, S.W., before the 25th inst. Such works will be subject to the approval of the London committee, those selected being forwarded to Tasmania free of charge.

A Copy of Da Vinci's *Last Supper*, which is supposed to be the work of Andrea Solario, has been removed from the storehouse of the Brera to the refectory of Santa Maria delle Grazie, and placed near the original work.

The Dean of Manchester has received an offer of 500*l.* from Chancellor and Mrs. Christie for the erection of a pulpit in the nave of the cathedral. Their desire is to memorialise Mr. Christie's twenty years' tenure of his office as chancellor of the diocese.

The Annual Convention of the American Institute of Architects is to be held in Boston, October 28, 29 and 30, and the Boston Society of Architects and the Boston Architectural Club have united to organise, in connection with it, an Architectural Exhibition.

A Lutheran Church is to be erected in Speier from the designs of Herren Flügge & Nordmann, which will cost a million of marks. The style will be Gothic.

Mr. William Rowell, of the firm of Messrs. J. W. Rowell & Son, architects and surveyors, of Newton Abbot, has been appointed surveyor of ecclesiastical dilapidations, from among a large number of candidates, in the diocese of Exeter, for the deaneries of Totnes, Ipplepen, Moreton and Woodleigh. The office was rendered vacant by the death of Mr. R. C. Reade, M.A.

Professor D. E. Jones, of University College, Aberystwyth, has been appointed director of technical instruction for the county of Stafford.

The Plans for the proposed hospital for infectious diseases at Rowley have not met with the approval of the officers of the Local Government Board.

The Architect.

THE WEEK.

A letter has been sent by Messrs. Kirk & Randall to the School Board of London concerning what seems to be an undoubted grievance. On August 13 they received an intimation from the Board that they had been selected to tender for the erection of Kemsing Road School, Greenwich. The day following they replied that they would be pleased to submit a tender. They accordingly tendered on August 31 to carry out the work for 16,354*l.* Three days afterwards Messrs. Kirk & Randall received a letter informing them that the tender of Messrs. Lorden & Son had been accepted at 16,881*l.* In their last letter they ask why they have been passed over, and the work given to a firm whose price was 527*l.* in excess of theirs. The arrangement does not appear to be fair to them as contractors, nor satisfactory to them as ratepayers, and they ask that their letter may be placed before the Board at their next meeting. The protest has been referred to the Works Committee for consideration and report, and the explanation we hope will be satisfactory to all concerned.

M. Lavastre, who was one of the principal scene-painters of Paris, died in that city on Thursday in last week. His work for the Opera House, the Théâtre Français and the principal theatres was so important, in spite of its temporary purpose, that if he desired he might have been elected a member of the Académie des Beaux-Arts. But he was modest in valuing his pictures for the stage. M. Lavastre was the decorator of the domes of the exhibition building of 1889.

It is still possible to obtain works by painters who are favourites with the French at prices that are worthy of the London "Slaughter-House." The sale of the property of the late Madame Agar, the tragic actress, afforded one of those desirable chances. A small painting by Corot, an Italian landscape, was sold for 99 francs. A head of a young girl by the fashionable portraitist, M. Carolus Duran, brought only one-third the sum, or 33 francs. Millet's *Mother Martin and her Cow*, painted in 1861—the gem of the little collection—went for 607 francs. Once upon a time Rachel was the idol of Parisian playgoers, but not a sou was offered for her portrait, and it became necessary to add a batch of engravings in order to obtain a franc for the compound lots. The low prices may hereafter add to the interest of the paintings, and why should not Millet's *Mère Martin* one day be taken as equal to the *Angelus*, over which so much money has been expended?

As was anticipated, the Special Committee of the London County Council have not been able to prepare a report that will do much for the settlement of the question of water supply. An excuse is offered for the failure by suggesting that the committee were tied down by the House of Commons, and could not, therefore, act with the liberty that was necessary in such an investigation. They say that the Parliamentary Committee have hampered the action of the Council in the matter by the recommendation that the Council shall be obliged to purchase the undertakings of the water companies before they can place themselves in a position to deal effectually with this subject. And, further, the committee clearly incline to the opinion that a fresh supply will, or may be, necessary, and that London may have to go to Wales or to some distant region for such a supply. At the same time, they have declined to recommend the course best calculated to bring the question to an early settlement, and they leave the subject in a very unsatisfactory position. Their recommendation with respect to the future action of Parliament clearly points to the case of Birmingham, which is coming to Parliament next year with a scheme for appropriating one of the best remaining sources of supply in the country, namely, a mountainous district in Mid-Wales. This involves the Council in serious difficulties. To leave Birmingham unopposed may be to lose the chance of an excellent source of supply for London. To oppose Birmingham without any definite scheme for occupying the ground which Birmingham proposes to appropriate will be both invidious and difficult. All the committee of the London County Council can do is to propose the following resolutions:—1. That the Council, whilst expressing their readiness, so far as their legal powers enable them to do so, are prepared to undertake the duties and obligations mentioned in the 1st, 2nd, 4th, and 5th recommendations in paragraph five of the report of the Select Committee, but are unable to accept the condition contained in the 3rd recommendation, that the Council, if constituted the water authority, should be required to purchase the undertakings of the eight water companies "by agreement, or, failing agreement, by arbitration, within a fixed period." 2. That the Council are prepared to accept and act upon the following recommendation, contained in the report of Sir William Harcourt's Select Committee on Water-Supply, viz. "That for certain purposes at least it would be desirable to acquire the undertakings of the existing companies, if the same could be obtained on fair and reasonable terms." 3. That the Council are of opinion that the price to be given for the undertaking of any company should depend not merely on past dividends or on Stock Exchange values, but upon the true value of the undertaking, having regard to its legal position and liabilities, to the condition of the property, and to its ability to supply future wants. 4. That, in order to arrive at a satisfactory conclusion on this last question, it is essential before any terms of purchase can be considered, that the liabilities to capital expenditure for new or supplementary sources of supply in the immediate future should be authoritatively ascertained. Before all these problems can be satisfactorily settled, it is needless to say that every available source of supply in England will be appropriated. Birmingham need not be apprehensive of opposition.

The London School Board during the past year have erected five permanent schools, ten have been enlarged, and twelve temporary schools were opened, giving places for 12,167 children, but as two temporary schools, with places for 3,084 children, were closed, the net addition is more than 9,000 places to meet the growing wants of London. There are now 410 schools, divided into 381 departments for boys, 371 for girls, 382 for infants and 37 "mixed," for boys, girls and infants together. It is claimed by the Board that there are no better school buildings, no better apparatus, no better supervision, no better teachers, no better systems of instruction of pupil-teachers, and, judged by all the known methods of testing school work, no better results.

It is, we suppose, no more than natural that Englishmen and Germans, as they are out of favour with the French, should be supposed to furnish the thief who lately stole a Sèvres vase from the palace of Versailles. Accordingly, a demand is made to the Department of Buildings for more servitors, to whom will be assigned the duty of scrutinising English and German tourists as they leave palaces and buildings containing anything that is valuable and portable. The authorities probably are not led away by the theory of a foreign thief, and are likely to believe that the vase in question was carried off by somebody who was well acquainted with the place and with the hours when observation was not keen. There is no doubt, however, that at Versailles the lax control would be considered as affording temptation to anybody who is dishonest. The rooms forming the apartments, which are locked unless when an attendant accompanies a party, although communicating, do not always run in one direction. Some of the visitors can lag behind and become invisible to the attendant, whose mind is more likely to be engaged in speculating on the amount of his tips than in considering the danger to the public property. But the figures or vases are of a size that prevents their removal unless by a man or woman who was provided with special means of hiding the plunder. Nothing to be seen in the rooms could be carried in the pocket of any ordinary coat without exposure. It is, therefore, ridiculous to suppose that a stranger was the culprit in the robbery that has lately occurred. With all their defects, the ordinary English tourists have hitherto proved themselves to be honest, and as for the Germans they have chances enough in their own palaces. Sans Souci would by itself be a mine, for it abounds with relics on a miniature scale.

1851—1891.

THE interval taken by Scott when he wished to contrast the past with the present was one of sixty years. It is, however, possible to suggest great changes by means of a shorter period. At present we propose to offer a very few jottings, which, if they do not serve to indicate the transformations which have occurred during forty years, may at least recall the names of some men who were living in 1851, but are now among the dead.

The period in question is one that merits more attention than it has received. It is sometimes supposed by the younger generation that previous to 1851 there was not much English art that deserves remembrance. As regards fine art that is an error. The Hyde Park Exhibition did not advance painting or architecture, and its influence on sculpture was too slight to be calculated. It is only necessary to glance at the lists of members belonging to the various academies and societies of artists about 1851 to be convinced that there were great men in those days, and that many of them have not been surpassed by their successors.

It is remarkable that not one of the Royal Academicians of 1851 now forms part of the society. Mr. F. R. Pickersgill, who is on the retired list, was only an Associate in that year. Of two others who have withdrawn, Mr. W. C. Marshall was not elected until 1852, and Mr. Frith in 1853. Mr. Hook received full honours in 1860, Mr. Goodall in 1863, Mr. Horsley, Mr. Faed, and Sir J. Millais in 1864. Among the Associates of 1851 were Francis Grant, afterwards president; Sir John Watson Gordon, better known as president of the Scottish Academy; J. H. Foley, the sculptor; J. C. Hook, T. S. Cooper, T. Creswick, A. Elmore. Aartists whose names have been closely associated with the Academy were outsiders forty years ago. But there was no lack of talent within the Academy. Such painters as Turner, Mulready, Maclise, Stanfield, Edwin Landseer, Leslie, Roberts and Eastlake; sculptors such as Gibson, MacDowell and Baily; and architects of the standing of Barry, Cockerell, Hardwick and Smirke were enough to uphold the reputation of any academy of art, and to inspire the younger artists and students with emulation.

It was to be regretted that for the works of the Academicians and other artists no place could be found in Paxton's building. It was only as an exemplar of an exhibitor's colours that a vigorous figure painted by Mr. Armitage was admitted. It is true the space was limited enough, but it is not easy to understand an arrangement by which sculpture was tolerated on account of the bronze and marble, while painting was ignored. In subsequent international exhibitions a more reasonable and comprehensive classification was adopted.

Water-colour painting is a form of art that seems to need a placid disposition in the artist. Power over nerves may have much to do with the lengthened practice which members of the old Water-Colour Society have been able to enjoy. It is satisfactory to find that several members of the Society in 1851 are still able to produce excellent drawings, and we hope they may long continue to connect the art of two periods.

The new Society of Water-Colours, which was subsequently transformed into the Royal Institute, has not left many representatives, but we still have among us John Absolon, Edward Courbould, Charles Davison and Harrison Weir.

The quality of the Royal Hibernian Academy of 1851 has to be judged by a solitary Academician, who now serves art in another way than by producing beautiful drawings; we are referring to Sir Frederick Burton. In those days his work appeared with the landscapes of Petrie, in which inanimate nature became almost pathetic; the marine views of Kendrick, the portraits of Catterson Smith and Cregan, and the everyday scenes of Crowley and Rothwell. It was a time when people expected that painting was about to flourish in Ireland, but unfortunately it is at such periods a blight always appears which is destructive. And yet the Academy which possessed so many able members was founded as late as 1825, previous to which time there was no organisation of artists in Ireland.

The Royal Scottish Academy, which was a year younger, consisted in 1851 of a far larger number of excellent artists than the Irish institution. Among the members were Francis Grant, A.R.A., Robert Scott Lauder, Horatio Macculloch, Noel Paton, George Harvey, Colvin Smith, Daniel Macnee, John Houston, Thomas and John Faed, Alexander Fraser, painters; Lawrence Macdonald and John Steell, sculptors; Thomas Hamilton and Charles Wilson, architects; with Sir Watson Gordon as president.

The Liverpool Academy was also flourishing, and annually gave a prize of 50*l.* for the best oil-picture exhibited. There were also academies in Bristol, Glasgow, and more art unions than we have at the present time. All these bodies were evidence of a widespread interest in art, and were independent of the great exhibition.

Any visitors who were curious about the official process for turning out designs would find the Government School of Design installed in Somerset House. It was under the control of a committee of management that did not meet at the school, but at the Board of Trade. The chairman was Mr. Labouchere, president of that Board, the vice-chairman, Lord Granville, who did not then stand high on the official ladder, being only Vice-President of the Board of Trade. The members of the committee consisted of the Secretaries of the Board; Mr. Stafford H. Northcote, who was in those days the legal adviser to the Board; Mr. Shaw-Lefevre, Clerk of Parliaments; Sir R. Westmacott; Mr. George Richmond, who was then outside the Academy; and Mr. Ambrose Poynter, architect and referee under the Metropolitan Building Act; with Mr. W. R. Deverell as secretary and curator. The instruction was given by Mr. Herbert, R.A., Mr. Redgrave, A.R.A., and Mr. H. J. Townsend (the last a most promising artist who disappeared mysteriously), who were head-masters, and by Messrs. Richardson, Burchett, Denby, Herman and Deverell, the assistant masters. Mr. Wornum was an occasional lecturer. It is remarkable that out of so large a body there is only one survivor, Mr. Richmond.

The principle of the school is also among the things that were. The school was simply for the teaching of industrial art. The prospectus stated that for two shillings a month instruction was available for all who desired to obtain knowledge of ornamental art in relation to every kind of decorative work, more especially to such persons as were, or intended to be, engaged in the preparation of designs for the various manufactures of this country. Drawing, painting and modelling were therefore taught with a view to the acquisition of knowledge and skill in ornamental design and decoration. This formed the essential and characteristic business of the school, by which it was distinguished from other schools of art. Accordingly, all the exercises of the students were required to have reference immediately or ultimately to the purposes and requirements of ornamental design. The curriculum will appear very circumscribed if compared with the courses in later art schools. There were eighteen branch schools where the system was in force, viz. in Spitalfields, Manchester, Birmingham, Coventry, Nottingham, Norwich, Sheffield, Stoke, Hanley, Leeds, York, Huddersfield, Newcastle, Glasgow, Paisley, Dublin, Belfast and Cork, and a school for female students was opened at 330 Strand, opposite the entrance to Somerset House. The whole of the schools contained 3,000 students, which, if correct, seems a small number if compared with the returns from the existing schools.

An artisans' school, that was independent of the directive authority of the Board of Trade, was to be found in St. Mary's Terrace, Camden Town. As it was, however, under the patronage of Prince Albert, the opposition, if any, to the Government School was slight. The committee, that included Mr. Baily, R.A., Mr. Ford Madox-Brown, Professor Donaldson, Mr. Thornycroft and Mr. Digby Wyatt, acknowledged the value of the Somerset House and Spitalfields schools, but they considered that the great distance from the localities chiefly inhabited by the workmen employed in casting and chasing of metals, masonry, carving, plastering, cabinet-making, house-painting and decorating, &c., virtually excluded such students from the advantages to be derived from the Government schools. In the Camden Town school the value of

modelling to industrial designers was recognised. The master was Mr. Cave Thomas.

Students who wished to be painters of pictures or modellers were able to find opportunities for practice. Besides the Academy schools, the British Museum and the National Gallery, there were the life academy and draped figure class of the Society of British Artists, that was more prosperous in those days than now; the Artists' Society in Clipstone Street, where a model sat for two hours of an evening, and where Mr. Knight, R.A., lectured on Perspective, Mr. Planché on Costume, Mr. Rogers on Anatomy and Mr. Field on the Chemistry of Colours. Another life academy, also supported by subscriptions, was in Margaret Street, Regent Street, while to many the most important of all were Leigh's and Carey's academies.

MUNICIPAL IMPROVEMENTS IN DUBLIN.

ON Saturday last the members of the Incorporated Association of Municipal and County Engineers met in the Council Chamber, Dublin. The president, Mr. T. de Courcey Meade, C.E., surveyor to the Hornsey Local Board, was chairman.

The President delivered a short address on the aims of the Association and then said:—As an Irishman I recollect passing through Dublin twenty-five or thirty years ago. At that time Dublin was different from what it is to-day. The pavements then were not of the best, and I was pleased to observe that a great change for the better had taken place ten or eleven years ago, when I visited the city for the second time. I was still more pleased when this week I saw the still more important improvements. The hurried visit we pay this time to Dublin prevents the members who have not been here before from seeing one-tenth of what is to be seen in this ancient and interesting city, but I hope that this, our first visit to old Ireland, may be one of many happy and instructive visits which we may pay to this country.

Mr. Spencer Harty, the engineer to the Corporation, was then called upon to read his paper on "Sanitary and Other Works carried out by the Corporation of Dublin." In the course of his paper he stated his object was to give the Association, on their visit to Ireland, as graphic an account as possible of the sanitary and other works carried out by the present Corporation of Dublin, who, with the limited means placed at their disposal, had within the last thirty years so much improved the city that it now could compare favourably with the best-regulated cities in the British empire. Unfortunately, Dublin was not a manufacturing city, and portions of the old city were going into decay; but yet, like the phœnix, it seemed to again rise out of its ashes, other portions springing up and taking the place of those going into decay. The valuation of the city was made many years ago, and the rates were still struck on this old valuation, which in most cases averaged only from one-half to two-thirds of the rent of the houses. Accordingly, the rates seemed high in proportion. The city was also surrounded by townships with independent control, and to a stranger it would be impossible to say where the city ended and the township began. Not one of these townships would be in existence but for the city, and were dependent on the latter for their support. It was late in the day for such divisions; all should be united and placed under one joint board of control and government, who would work together in harmony for the general good, and so equalise the rates. The city proper was bounded by the Circular Road and Royal Canal on the north side and Grand Canal on the south, and contains 3,808 acres, the river Liffey dividing the city into two parts. The average breadth of the city from west to east was 3¼ miles, and length from north to south 2½ miles. It stood somewhat low—the level of the roads on the quays being on an average 20 feet over low-water mark, ordinary spring tides Dublin Bay; from thence there was a gradual rise to the north and south—the former standing on an average 90 feet over ordnance datum, and the latter 65 feet over ordnance datum. The local authority was the Corporation of Dublin, comprising the Right Hon. the Lord Mayor, aldermen and town councillors (sixty members in all, fifteen aldermen and forty-five councillors), representing fifteen wards into which the city was divided. This, the reformed Corporation, came into being in 1851, superseding the older Corporation guilds and a commission known as the Paving Board. The first great sanitary work of the present Corporation was the waterworks. The present Vartry water supply came from a site that was found by Mr. Richard Hassard, a Dublin engineer at present residing in London, but the works were carried out by the late city engineer, Mr. Neville. The Vartry stream rose at the base of the Sugarloaf Mountain (on its southern side), in the county of Wicklow, at an altitude of about 1,050 over ordnance datum, and flowed from north to south, a distance of five miles to the commencement of the impounding reservoir, situate under the village of Roundwood, passing altogether through pastoral lands. On its route to the reservoir it received the addition of tributaries, some of which were larger than the main stream itself. The geological formation of the ground was the Cambrian and Lower Silurian. The water was pure soft water, very much akin to that of Loch Katrine, the degree of hardness being about 1·600 before boiling—Loch Katrine being about 1·900. The work commenced in the year 1862, by forming a large embankment to impound the river and flood the lands to a level of 692·50 over datum, the top bank being 698·50. The area of the ground under water was 409 acres, the by-wash or overflow weir 300 feet long; the cubical content of water in the reservoir at this level was 2,374,358,344 gallons, but means had since been adopted to raise the height of water 12 inches, by stop planks fixed on the top of weir, which had the effect of increasing the quantity by nearly 109 million gallons. A tunnel was built in the rock under the embankment, having a solid plugging (on the water face) of Staffordshire blue firebrick set in cement 38 feet thick; through this was carried two main pipes, the one being 33 inches diameter for the supply, and the other 48 inches for purposes of running water into the old bed of river below the works in case of any necessity to do so. The supply of Vartry water extends and ramifies over a very extended area and district, which includes:—The city, 3,808 acres; Clontarf Township, 1,295 acres; Drumcondra Township, 918 acres; Kilmainham Township, 535 acres; Pembroke Township, 1,621 acres; Blackrock Township, 1,084 acres; Kingstown Township, 1,467 acres; Dalkey Township, 592 acres; Killiney and Ballybrack Townships, 1,017 acres; Bray Township, 1,070 acres; and to extra municipal and rural districts, comprising Cabra, Phœnix Park, Artane, Yellow Lanes, Terenure, Dundrum, Rathfarnham, Rathdrum, &c., of which it was impossible to get the exact area and population. The entire district supplied, including city, township and extra municipal districts, contained an average area of about 40 square miles, all of which was supplied with water from the 33-inch main under the main embankment at Roundwood, only 3¾ turns of the valve being open out of a total of 40 turns, the full number which it takes to open the valve. Each township paid the Corporation a certain fixed rate on its valuation for the water supply, but the supply to the rural districts was in the hands of the Corporation. The entire cost of the works up to date has been 660,000*l.*, which was equal to about 1*l.* 17*s.* per head on the gross population supplied, taking the population of rural districts at 20,000. The rental received by the Corporation for their water supply for 1889 from all sources was, gross total, 62,343*l.* 13*s.* 11*d.* The cost of maintenance, including salaries of officers, office expenses, labour and materials, was 60,491*l.* 6*s.* 4*d.*, leaving a balance to credit of 1,852*l.* 7*s.* 7*d.* on December 31, 1889. Dealing with the question of paving Mr. Harty said:—In more recent years, and up to the year 1851, the maintenance of the streets in Dublin was carried out by a Board called the Commissioners for Paving the Streets of Dublin, after which time it was transferred to the present Corporation, who lost no time in trying to set their house in order, and at once commenced to pave some of the streets with square setts, and laid down others with macadam. Gradually, however, macadam was disappearing from the streets, and sett paving on a concrete foundation increasing in the same ratio. Before the passing of the Irish Public Health Act of 1879, the improvement rate in Dublin was limited to 2*s.* in the pound, so that the hands of the Corporation were practically tied, and very little improvement could be carried out in the way of street paving, &c. Previous to 1880 there was no street paved with setts on a concrete foundation. In that year, however, 100,000*l.* was borrowed from the Government for twenty years, at 7*l.* 0*s.* 8*d.* per cent., including principal and interest, the latter being 3½ per cent., and the first street thus paved was Marlborough Street. Again, in 1886, another 100,000*l.* was borrowed, and paving still further extended on the same system, but work was carried out by men in the employment of the Corporation and without any contractor. The cost of work varied considerably, some streets costing as much as 13*s.* 6*d.* per yard, whilst others have cost only 11*s.* 6*d.*, the price of setts being much higher than formerly. The cross-section had also been reduced, but in many instances it would have been better if the streets had not been paved so flat, as the cost of maintenance was increased, and the water was not so easily thrown off. The entire cost of square sett paving in Dublin up to the present had been about 310,000*l.* The total mileage of the streets and lanes of Dublin was about 126 statute miles. For the maintenance of the streets the sum passed by the Council for this year was—Macadamising, 6,000*l.*; paving, 7,491*l.*; flagging, 3,425*l.*; ashphalting, 500*l.*; concreting for paths, 2,442*l.* Now there were about 1,168,000 square yards of macadamised streets in the city, for maintenance of which they got 6,000*l.*, or about 1¼*d.* per square yard of street surface, including labour, and where some of the streets are completely worn down and had

to be remade each year, thus taking a large portion of the sum passed, it could hardly be said that the amount was sufficient for the proper maintenance of macadam in Dublin. For the paving they got about 2⅛*d.* per square yard, and for this also they had gradually to repave some of the streets, and still maintain and repair the wear and tear of the remainder, for which the sum voted was only ¾*d.* per yard. Most of the streets about the centre parts of the city, especially adjoining the river, were all on made ground (and in no parts had they a clean gravelly subsoil); the consequence was that the formation of the streets generally was a soft, muddy and dirty one, and it was an absolute necessity, in a sanitary view, to use concrete foundation, and in many instances it should be thicker than the prescribed 6 inches. Referring to wood-paving on concrete foundation, he said it was first laid down in 1880; most of this was still intact, and had not required any outlay whatever. The entire scavenging and cleansing of the city was now carried out by the Corporation staff, and without any contractors; stabling and offices, together with depôts, being placed in various districts of the city. Strictly speaking, there were no refuse destructors in Dublin. They had in one depôt a furnace for the burning of a certain description of garbage, but it was not of the most recent design, such as were at present made in England. A great deal of the scavenge of Dublin had to be taken to the sea in a hopper barge, the barge being towed out by a tug-boat some distance beyond Howth Head. There were 147 trips run last year, and 63,416 loads of unsaleable refuse were thrown into the deep sea, the total cost being 1,371*l.*, or a little under 5*d.* per load. Saleable stuff from the streets was, as far as possible, sold, but of recent years the sum received had dwindled down from 1,400*l.* in 1888 to 662*l.* in 1890. Undoubtedly the time was fast approaching when proper destructors must be erected in Dublin, or else more barges put on the station, which was a most expensive operation. The cost of the barge was 6,261*l.* There were 474 men employed in the cleansing department last year, and 115 horses, the total cost of each horse amounting to about 10*s.* 6*d.* per week for food and straw. The estimate for public and domestic scavenging for 1890 was 29,170*l.*—equal to 6*d.* per square yard on the entire surface of streets. There were something close on 100 miles of sewers in Dublin, 76 of which had been entirely newly built by the present Corporation, the remainder being old ones remodelled, renewed and underpinned; all the new brick sewers were egg-shaped and the old had been newly inverted. The sewage at present all gravitated to the Liffey, where it was discharged, all the outlets being well within the city boundary. Although most of the sewers had good falls and were properly constructed so as to be self-cleansing, in a great many instances it was found that such was not the case, partly caused by the scavenging labourers sweeping the mud, &c., down into the gullies, and private drains being made use of for the purpose of getting rid of ashes and all sorts of house refuse. This was a difficult matter to deal with, as it was almost impossible in either case to get at the delinquents; nevertheless it was not only a source of trouble and annoyance, but also of expense. There was no automatic flushing to any of the Dublin sewers, the course adopted being to flush periodically by means of a hose worked from one of the street hydrants. For many years the question of taking the sewage out of the river had been agitating the public mind, and in 1870 a scheme was promoted before Parliament, and for which an Act was passed, to convey the sewage out to the North Bull, a distance of about four miles from the city boundary, and there discharge it into the bay at certain states of the tide. Plans were got up for this work and estimates obtained, but the amounts were so much in advance of the estimates that the work was withdrawn, and the scheme remodelled; but even this latter was withdrawn. Subsequently it was proposed to get up a scheme of precipitation, the works to be constructed on the slob lands at Annesley bridge, immediately adjoining the city boundary; however, nothing had been done, and the Act had been allowed to lapse. The question had now again been brought forward, and the Corporation are at present deliberating on what course to pursue. Undoubtedly, so far as Dublin was concerned, the proper course would be to discharge the sewage at once into deep sea, if a suitable outfall can be obtained at a comparatively reasonable outlay. The remainder of the paper, which was not read, dealt briefly with baths and wash-houses, markets, the abattoir, public libraries, &c.

Mr. Edward Pritchard expressed his thanks to Mr. Harty for his able and instructive paper. It was a matter of great interest that they should be in Dublin, and he hoped they would be here again before long. Dublin must be complimented on its water supply—a supply of such purity and abundance at so small a cost. Dublin had its supply now for thirty years, while in Liverpool, Manchester and other places great efforts had been made to improve the supply. In Birmingham, where the water supply was intended for 600,000, it was proposed to expend five or six million pounds to improve the present supply. That must appear satisfactory for Dublin.

The Lord Mayor gave a banquet to the members.

Mr. de Courcey Meade, in responding to the toast, "The Association," said that it afforded the members of the Association extreme pleasure to visit the Emerald Isle. It was their first visit to Ireland, and it was to him, as an Irishman, an honour to represent the Association on their first visit to that dear old country. The friends who accompanied him to the city were agreeably surprised with all they saw there. They had heard something of the fine waterworks, but while they never questioned that there were works of a great character, all they anticipated in reference to them was more than realised by their visit to them on the previous day. On that morning they visited the great establishments—the brewery of Messrs. Guinness, and the distillery of Messrs. Power, and in both places they were received with the greateat courtesy and kindness by the representatives of the respective firms. As to the extent of the works connected with both establishments, it was not imagined by nine-tenths of the gentlemen who that day visited them. Since they left those works, it was a matter of constant remark as to the immense business which was carried on in the ancient city. Their Association was especially an Association of engineers, but there were amongst them some architects who were very near failing in some of their appointments owing to their desire to go out and view some of their fine buildings; one, in particular, the Bank of Ireland, then Trinity College, and numerous other buildings. On his way to the City Hall that morning he saw no less than three of their members photographing the buildings, for they wished to take back impressions of the fine old buildings in the capital of Ireland. It was gratifying to the members of the Association to hear the remarks made by the Lord Mayor, and to be received by his lordship with so much courtesy and hospitality, and they should certainly go back to their own country impressed with the hospitality of Irishmen. On former occasions they had been entertained hospitably by the Lord Mayors of London and York, and by the Mayors of Manchester, Liverpool, and most of the large towns in England, but yet he could safely say that they had never in years gone by been received with such courtesy and hospitality as they had been by all with whom they had been brought into contact since they landed in the old city of Dublin.

Mr. Pritchard, C.E., said, as it was his third visit to Dublin, he knew something about the city, and he should say this, that while they prided themselves on their municipal institutions and home government in England, he and his brethren of the Association now in this city would certainly be very quiet when they should get back. They should have to say this, that if they took into consideration all the advantages enjoyed by cities and towns in England there were few of them which could compare at the present moment with that ancient and beautiful city of Dublin in which they now were. Mr. Harty gave them a history which they should never forget. He told them that Dublin was an ancient city. If they did not know that before they ought to have known it. It had one of the best water supplies in the world—a supply so vastly in excess of the requirements that they were prepared to allow the inhabitants the use of an abnormal quantity. Liverpool, Manchester and other cities had to bring their supplies from long distances. One city obtained its water in Wales, some 60 or 80 miles off; another city obtained its water from the lakes of Cumberland. Birmingham had a population of over 600,000; it had a water supply, and they were now going to amend that supply at a cost of from 5,000,000*l.* to 6,000,000*l.* These were important facts. Years ago the streets of Dublin were paved with old cobble stones, and it required strong boots or shoes to walk over them. All those stones had been since removed, and the streets of Dublin were now paved in such a way as they should be proud of any English town which was equally well paved. Odours, of course, arose from the celebrated and historic river Liffey, but the less said on that subject the better. Much could yet be done for the improvement of their works and for the health of the inhabitants of the city.

BLEWBURY CHURCH.

THE parish church of Blewbury was reopened this week after restoration, which has been carried out, under the direction of the diocesan architect (Mr. John Oldrid Scott), by Mr. Y. J. Lovell, of Marlow.

The church of St. Michael, formerly dependent on Reading Abbey, is, the *Reading Mercury* says, a structure of rubble, flint and stone, consisting of chancel, with a chapel on the south side, nave, aisles, transepts, the piers and lantern stage of a central tower, north and south porches, and a fine western tower of three stages, with a quatrefoiled parapet and crocketed pinnacles with vanes, and containing a clock and six bells, of which the fourth and earliest is dated 1586, and the others 1633, 1689, 1704, 1752 and 1825 respectively. It was originally a building of the late Transition or Anglo-Norman period, dating from about 1180, a considerable portion of this structure still existing. The chancel, with its interior south wall, is Transi-

tional. It retains a fine stone groined roof and one of its original windows, besides a small circular opening in the apex of the eastern gable, but its other windows are late Decorated. The south wall of the chancel was cut through about 1350, on the erection of the chapel. This is a Decorated work, and the reticulated tracery of the windows is characteristic of the style at its best period. On the south side is a piscina; two pointed arches, enclosed by screens of carved oak, open to the chancel, one of these being good Perpendicular; and there are also two ancient prayer-desks of the same date, both elaborately carved. The piers of the central tower, also Transitional, are of unusual thickness, and at the angles are slender nook shafts, the capitals having the volute and straight-leaved ornament peculiar to this date. From the chafings of the ropes upon the arches, still plainly distinguishable, it would seem that this tower had four bells. The vaulting is perfect; the two easternmost piers are pierced with hagioscopes, that on the south being Perpendicular and the other square and probably original; the south-west pier contains a flight of stone steps leading to an open archway on the right of the nave, and anciently the entrance to the rood-loft, which, it appears, had a piscina, a unique feature discovered and carefully preserved during the recent restoration. The lower door is Perpendicular, with elaborately carved panelled tracery. The nave is separated from the south aisle by an arcade of five Transitional arches, the two westernmost being wider and loftier than the others. These spring from stilted circular columns, the capitals having the volute ornament, and in one instance early foliaged work. The north arcade is Decorated, and has two arches only, supported by octagonal columns. Plain Perpendicular windows light both aisles, and the west window in the tower is a good example of the same date. The tower opens to the nave by a bold and lofty arch, and its lower stage serves both as a vestry and ringing chamber. The original porches seem to have been removed in the Perpendicular period, and replaced by substantial porches of open timber-work with bargeboards richly carved. Of these the south porch remains, but the north porch has lately been rebuilt in flint with stone dressings, its carved work reproduced and a new oak door hung. Above the doorway is a stone niche, and on either side are small stone slabs, one containing brass figures with scrolls. The south door, a venerable relic, has a huge wooden lock and fine Early English ironwork. The font is of Perpendicular date, octagonal and panelled in quatrefoils; around the under surface are alternate fleurs-de-lis and *écussons à bouche*. In the church are several brasses to the ancient family of Latton, of Upton and Chilton, and subsequently of Kingston Bagpuize, and of Esher, in Surrey. The earliest is that of a knight in a full suit of plate armour, with his two wives, date probably c. 1500, and perhaps representing Thomas Latton, of Upton, who died April 8, 1503. These figures were formerly affixed to the walls, having been removed from their stone slab, a portion of which, with a brass shield of Estbury, has long served as a step at the south door. During the recent restorations the figure of the knight with one wife and some children have been affixed to a new stone and placed on the north wall of the chancel, the other wife being left on one of the tower piers. There is, however, ample evidence to show that they all belonged, until the last century, to one memorial. On the south side of the chancel, on the floor, is the brass of John Latton, of Chilton, with effigies of himself, habited in a tabard of his arms; Anne (Yate), his wife, and six children out of the fourteen named in the inscription. He died May 31, 1548; Alice, sister of this John Latton, married Sir John Daunce, general surveyor of crown lands in the reign of Henry VIII.; he accompanied the King to France in 1513, and was knighted by him in the church of Tournay; in 1515 he was Sheriff of Oxon and Berks, represented Oxfordshire in the Parliament of 1529, and died December 7, 1545. The remains of the tomb erected, apparently both to himself and his wife, are now in the south chapel, having been removed thither since the time of Ashmole; it was originally an altar tomb, but only the upper slab and some portions of the base now exist; on the former are the figures, in brass, of Sir John and Dame Alice Daunce; both are heraldically clad, and around are the shields of Daunce, Latton, Estbury and Percy, with an inscription to Dame Alice Daunce, who died August 27, 1523. Against the south-east pier, in a slab of Purbeck marble, is a brass with effigy and Latin inscription to John Balam, a former vicar, who died May 25, 1496, and on the south side a modern brass, with a figure of Faith, and inscription to the Rev. Jacob Macdonald, LL.B., of Caius College, Cambridge, thirty-five years vicar of this parish, who died June 4, 1871; his wife, Eliza, 1849, and his son, John, 1841; below this is a marble tablet to the Rev. Arthur Bromley, chaplain to John, third Earl of Clarendon, and for five years curate here, who died December 29, 1831; on the opposite wall, previous to the restoration, was a large monument of good Classic design, to Mrs. Sarah Witherell, died October 12, 1728, with fluted columns supporting a pediment. This has entirely disappeared, and the memorial slabs formerly on the chancel floor have been buried, and the floor entirely relaid with encaustic tiles. Of these slabs, one bore an inscription to Elizabeth, wife of Daniel Lousley, who died June 15, 1828, and has been reproduced on a smaller scale; the remainder are indicated only by initials. A small Norman window on the north side has been filled with stained-glass to Eliza Serre Rotch, April 16, 1878. There are existing mural monuments to John Bushnell, Esq., 1816; Ann Goddard, 1847; John Gammon, 1828; and to the family of Humfrey, 1788–1860; and floor stones inscribed to Thomas Plott, M.A., Fellow of Pembroke College, Oxon; Martha, daughter of James Baker Jauno, 1720, and to the family of Slade, 1757–1820; in the north aisle is a small inscription on brass to "John Casberde, one of the good benefactors to this church, c. 1500," and a large floor slab in the tower retains a similar one, much worn, to John Bouldre, 1499. Of other antiquities attached to the church may be mentioned two venerable copies of the religious books ordered to be provided by every parish in the reign of Edward VI., viz. Udal's edition of the "Paraphrase of Erasmus on the New Testament," and Bishop Jewel's "Defence of his Apology for the Church of England"; these are partly bound with iron, and have the chains by which they were probably attached to a lectern. Ashmole, however, says that in his time two large books were chained to the monument of Sir John and Dame Alice Daunce, mentioned above. In 1886 two recumbent effigies of stone, apparently of a knight and his lady, now much worn and lying on the east side of the south porch, were removed to the north side of the churchyard next to the tower. The restoration of the church has been proceeding at intervals for several years past, in part under the direction of Mr. Edwin Dolby, architect, of Abingdon, and has included the entire renewal of the nave roof, in exact fac-simile of the old open timber roof, the relaying of the floors and the removal of the high pews and north and west galleries; a new pulpit of carved oak has been erected and the eastern end of the chancel raised, a sedilia being formed in the eastern arch of the arcade now closed by new screen work; an ancient aumbry has also been refitted, and a reredos of carved alabaster set up and north porch erected. On the completion of the repairs to the nave and chancel, the church was reopened by the late Bishop of Oxford in 1877. More recently the north aisle has been restored, and an organ introduced, for which a special service was held on September 14, 1882. The communion plate includes a silver chalice, dated 1663, and a paten of silver, given by Malthus's trustees. There are 300 sittings, all being free. The register dates from the year 1588.
